No. 768,560, August 23, 1904, Casgrain.
No. 845,939, March 5, 1907, Flynt.
No. 906,705, December 15, 1908, Hadaway.
No. 1,005,185, October 10, 1911, Flynt.

Int. 99. After the operation of the lasting machine is the shoe then in condition to have the welt attached thereto by the operation of the welt-sewing machine? If not, what operation or operations had to be performed according to the method of manufacturing shoes in 1899? If any such operations were necessary in 1899, state what has been done by the United Company to provide shoe manufacturers with machines for performing such operations. If such machines form the subjects-matter of any Letters Patent of the United Company, refer to such patents. If, in answering this question, you have occasion to refer to any prior machines disclosed in the United Company's Letters Patent, please refer to such patents. If the United Company has developed any new methods or machines which rendered unnecessary any of such operations, describe such methods and machines, and if they form the subjects-matter of Letters Patent of the United Company, state the patents.

Mr. WEBSTER. The question is objected to for that it calls for matter not referred to in evidence presented by the petitioner, and because the same is not in reply to, or in defence of, any matter presented by the petitioner.

UPPER TRIMMING AND TACK PULLING MACHINES.

Ans. Immediately after the lasting operation a shoe has projecting outwardly around its bottom a bunch of stock comprising the upper leather and lining, and at the toe the edge of the box toe, if a box toe is used. This projecting stock is liable to interfere with the operation of the looper and the thread arm on the welt sewing machine in the subsequent operation of sewing the welt and upper to the insole. Accordingly this sulplus material must be trimmed off before the welt-sewing operation.

A lasted shoe, illustrating the condition in which the shoe is left

after the lasting operation, and illustrating the bunch of excess material at the toe to which I have referred, is shown in Defendants' Exhibit 149. Furthermore, the heavy lasting tacks which are inserted during the lasting operation to hold the upper in lasted condition, and which are also shown in Defendants' Exhibit No. 149, must be removed before the welt-sewing operation, as these tacks are liable to be broken by the needle of the welter, since they extend across the path of the needle, being driven into the bottom of the last; or, if the needle strikes a lasting tack squarely the needle will almost always be broken, resulting in a heavy expense in replacing needles. The removal of the lasting tacks is further desirable in view of the danger of breaking the thread of the inseam by stranding it on a lasting tack. Accordingly, it is the general practice to remove the lasting tacks before the welt-sewing operation.

TRIMMING MACHINE — MODEL A: REX UPPER.

As to the first of the operations to which I have referred, that is, the trimming off of the surplus upper stock to prepare the shoe for the operation of the welter, that operation was, prior to 1899, always performed by hand by the use of a hand knife. The United Company soon after its formation undertook to develop a machine for performing this upper-trimming operation, always before performed by hand, as I have stated. As a result of the experimental work of its inventors two entirely different types of machines were produced. The one which was first developed into commercial condition was that which is now known as "Trimming Machine, Model A, Rex Upper", and the first machine of this type was put into commercial use in December, 1905. The machine as commercially used was constructed substantially as shown in patent No. 961,200, June 14, 1910, Ashton.

One of the most serious problems which had to be dealt with in providing a machine for doing this work was the necessity for gathering the irregularly located and wrinkled stock into proper position for the operation of the cutting means. Substantial progress toward the solution of this problem was made by the improve-

ment of this Ashton patent No. 961,200, of which a typical claim is the following: —

"1. A vamp trimming machine, having, in combination, vamp trimming means arranged to trim the projecting edges of the vamp and lining of a lasted shoe, and a guiding roll located in close proximity to the trimming means and arranged to extend inside of the vamp and lining of a lasted shoe and direct the vamp and lining to the trimming means."

TRIMMING MACHINE — MODEL H: REX UPPER.

While, as I have stated, the machine shown in this patent No. 961,200, and defined in all of its sixty-eight claims, was the first machine to be put into commercial use, and while the machine was in general use for some two years and represented a substantial advance in the industry, and substantial progress towards the production of the satisfactory commercial machine which is now being put out by the United Company, the other inventor to whom I have referred, Hadaway, whose experimental work antedated Ashton's, was in the meantime developing a machine which ultimately proved to be a much more satisfactory machine for performing this operation. Hadaway had found, early in his experimental work, that there was danger that the plaited portion of the upper stock around the toe would not be properly trimmed, first because this stock flared outward, as is shown in Defendants' Exhibit 8, so that means must be provided for straightening up this flaring stock and presenting it in proper position for the action of the knife; and secondly, because there was liability of the folds of the upper stock working backwardly during successive operations of the knife so that it would not be trimmed at all. A weakness of the machine of the Ashton patent No. 961,200 was that the lining of the upper, which it is important to trim at this operation, was not always presented properly for the operation of the knife. As the result of Hadaway's experimenting, extending through a period of several years, he finally produced a successful machine, the organization of which provided for all of the difficulties to which I have referred. This machine was adopted as the standard commercial machine of the United Company in June, 1908, and it then superseded the model A

machine of the Ashton patent No. 961,200. The new machine is officially known as "Trimming Machine, Model H, Rex Upper". This new machine, as it has been put out for commercial use since its adoption in 1908, is constructed substantially as shown in patent No. 922,697, May 25, 1909, Hadaway. All of the thirty-nine claims of that patent define the organization of this new upper trimming machine. Typical claims which indicate in a general way Hadaway's solution of the problems which I have enumerated are the following: —

"6. A vamp trimming machine, having, in combination, a trimming knife for trimming the edge of the vamp and means for bending the edge of the vamp inwardly toward the medial line of the shoe into position to be acted upon by the trimming knife."

"13. A vamp trimming machine, having, in combination, vamp trimming knives, a frusto conical roll provided upon its peripheral surface with spiral ribs arranged to exert an outward wiping action on the shoe lining in proximity to the trimming knives, and means for rotating the roll."

"30. A vamp trimming machine, having, in combination, vamp trimming knives, and means acting on the projecting edge of the vamp of a lasted shoe in proximity to the knives to bend the vamp inwardly and force the bent-in portion relatively to the shoe in the direction of feed."

This new upper-trimming machine also embodied the guiding roll which was a characteristic feature of the machine of the Ashton patent No. 961,200, and a typical claim setting forth in broad terms this feature of the organization of both the Ashton machine and the Hadaway machine is the first claim of the Ashton patent No. 961,200, which has already been quoted.

The new model H upper-trimming machine also embodied in its organization improvements made by Hadaway at various stages of his experimental work, which are defined in broad terms in other Hadaway patents, No. 968,553, August 30, 1910, Hadaway, and 968,554, August 30, 1910, Hadaway. A typical claim of the first of these patents is the following: —

"11. A vamp trimming machine, having, in combination, a vamp trimming knife, a knife co-operating therewith arranged to extend inside of the vamp of a lasted shoe, and a guide separate from the knives, arranged to bear on the sole inside of the lip and raise the

vamp and direct it between the cutting edges of the knives, substantially as described."

A typical claim of patent No. 968,554 is the following: —

"8. A vamp trimming machine, having, in combination, a trimming knife for trimming the edge of the vamp, a co-operating knife arranged to extend inside of the vamp of the lasted shoe, and means acting on the vamp in front of said co-operating knife to raise the vamp and direct it between the cutting edges of the knives."

Four hundred and twenty-nine of the present commercial upper trimming machines, known as "Trimming Machine, Model H, Rex Upper", have been put out by the United Company through its pulling over department. One of these machines will easily take care of as many shoes as are welted upon four or five welt-sewing machines.

PULLING AND RESETTING MACHINE: GOODYEAR TACK.

Referring now to the other operation which, as was stated in the early part of my answer to this question, has to be performed after the operation of the lasting machine before the shoe is in condition to have the welt attached to it by the welt-sewing machine, it is the general practice to remove the lasting tacks which are inserted during the lasting operation to hold the upper in lasted condition. As has been explained, these lasting tacks, if allowed to remain in the shoe, cause prohibitive expense through breakage of needles on the welting machine, as well as for other important reasons.

It is important, however, that after the lasting tacks are removed the upper shall be retained in lasted position until the welt and the upper are together secured to the insole in the welt-attaching operation. It was accordingly the general practice, up to two or three years ago, and is still the practice in some factories, to insert lighter tacks known as "stay tacks" at the time the lasting tacks are pulled, to hold the upper in lasted position during the welting operation, that is, until the upper is permanently secured to the insole. Prior to February, 1899, there was no commercial machine for pulling the lasting tacks which had any provision for inserting any kind of fastening to hold the upper properly in lasted

condition after the lasting tacks had been pulled. The inventors of the Goodyear Shoe Machinery Company had done some experimental work with a view to producing such a machine, but the experimental machine had not reached a commercial condition in February, 1899. After the organization of the United Company, its inventors continued the experimental work which had been begun by the Goodyear Company, and beginning with the first experimental machine which is shown in patent No. 864,532, August 27, 1907, Hadaway, granted on an application filed November 6, 1899, a number of experimental machines were built in succession in the progress toward a satisfactory commercial machine. It proved a serious problem to organize a machine which would first pull the lasting tacks properly and pull them in such a manner as not to throw them all over the factory; and secondly, insert the stay tacks properly; and thirdly, insert the stay tacks only when and where desired by the operator. . However, after experimental work extending over a period of some ten years, there was produced and put into commercial use in November, 1910, a satisfactory commercial machine for pulling the lasting tacks and for inserting a less number of stay tacks to hold the upper for the welting operation. The commercial machine which is known as "Pulling and Resetting Machine, Goodyear Tack" is constructed substantially as shown in patent No. 1,049,474, January 7, 1913, Hadaway (application filed April 8, 1911). Although the specific construction of the stay tack-driving mechanism is not disclosed in any patent which has as yet been granted, the specific construction of the tack-pulling mechanism is constructed as shown in the drawings of patent No. 1,013,944, January 9, 1912, MacKenzie (application filed April 8, 1911).

The general organization of this tack pulling and resetting machine is set forth in broad terms in the claims of the first patent to which reference was made in discussing this machine, No. 864,532, August 27, 1907, Hadaway, of which typical claims are the following: —

"25. In a machine for preparing shoes for sewing, the combination with a tack pulling tool, of a downhold bearing against the

edge of the upper inside and adjacent to the line of tacks to be pulled, substantially as described.

"26. In a machine for preparing shoes for sewing, the combination with tack pulling mechanism for pulling lasting tacks and tack driving mechanism for driving holding tacks, of means for holding the upper of the shoe in position while the lasting tacks are being pulled and until the holding tacks are driven, substantially as described."

"38. A machine for operating on lasted shoes, comprising the combination with automatic means for withdrawing the lasting tacks, of means for driving stay tacks at will while removing said lasting tacks."

An important feature of the organization of the tack-pulling mechanism of this machine is claim 4 of patent No. 746,306, December 8, 1903, Eaton, which is as follows: —

"4. In a tack pulling machine, the combination of a movable tack puller and a guard or foot provided with an abutment arranged transversely to the line of movement of said tack puller and against which the tacks are held, substantially as described."

The organization enabling the tack-pulling mechanism of the machine to pull the lasting tacks of varying diameters is defined in the claim of patent No. 960,294, June 7, 1910, Eppler. A typical claim of this patent is the first: —

"1. A tack pulling machine, having, in combination, a tack pulling jaw, a jaw co-operating therewith, mechanism acting independently of the tacks for relatively actuating the jaws to engage and pull a tack and yielding means to permit the jaws to accommodate themselves to tacks of different diameters."

The general organization of the tack-driving mechanism with relation to the tack-pulling mechanisms which insured the proper location and positioning of the stay tacks is defined in claims of patent No. 1,049,474, January 7, 1913, Hadaway, granted on an application filed April 8, 1911, and of the many claims of this patent directed to this general organization, a typical claim is the first: —

"1. A tack pulling and resetting machine having, in combination, a tack pulling tool, a tack driving plunger adjacent thereto, the tack pulling tool and the tack driving plunger having tack pulling and tack driving movements respectively lying in planes

inclined to one another and extending in the direction of feed, and means co-operating with the plunger to deflect the course of the tack into a plane substantially parallel to the plane of the tack pulling movement."

The stay tack-driving mechanism illustrated in this Hadaway patent No. 1,049,474 was also improved upon by mechanism which is not as yet shown in any granted patent in the form in which it is embodied in the commercial machine. Patent No. 1,049,474 also contains claims to the general organization of the tack-pulling mechanism finally adopted in the commercial machine. A typical claim of this patent directed to this organization is the sixth: —

"6. A tack pulling and resetting machine comprising a jaw supporting arm, a crank directly connected to one end of the arm, an oscillatory supporting link pivotally connected to the arm intermediate its ends, a tack pulling jaw depending from the free end of the arm and having its tack engaging end directed toward the crank, and means for rotating the crank in a direction to cause the jaw to move forward over a tack and pull the tack on its backward stroke."

Further improvements which were made in the progress of this machine toward commercial success are defined in the claims of patent No. 1,011,773, December 12, 1911, Hadaway, granted on an application filed September 9, 1905. Typical claims of this patent are the following: —

"1. A tack pulling machine, having, in combination, a tack pulling device, means for actuating said device to engage a projecting lasting tack and remove the tack from the shoe, and means engaging the upper on opposite sides of the tack constructed and arranged to guide the tack transversely to the plane of movement of the tack pulling device into position to be acted upon by the tack pulling device."

"11. A tack pulling machine, having in combination, a tack pulling device, a stationary ejecting device for removing a tack from the tack pulling device, and means for actuating the tack pulling device to remove a projecting lasting tack from a shoe and bring the tack into engagement with the ejecting device."

Stapling Machine: Goodyear Upper.

The United Company also put out another machine for removing lasting tacks from welt shoes, which was first supplied to man-

ufacturers in November, 1912. This machine, however, was especially devised for use in connection with a machine known as "Stapling Machine, Goodyear Upper", which machine does away with the necessity for inserting stay tacks. In order that the discussion of tack-pulling machines may be complete, it will be necessary to explain briefly the purpose of this upper-stapling machine and the field which it occupies.

This upper-stapling machine, introduced in April, 1911, performed for the first time in the industry the operation of securing the lasted upper in position for the welting operation by driving a staple of soft, fine wire through the upper, lining and channel lip or rib, locating this staple just above the path of the needle of the welting machine in the subsequent welting operation, and just below the path of the knife of the inseam trimming machine in the subsequent inseam trimming operation. I produce a partially made shoe which has been operated upon by this upper-stapling machine, and to which a welt has been sewed on one side. The wire of which the staples are made is so fine that it is somewhat difficult to find the staples which have been inserted, although their clinched points can be seen inside of the outer lip of the insole, and the heads of one or two of the staples are visible on the outside of the upper.

[*Shoe having upper secured by stapling machine, Goodyear upper, is introduced in evidence, and marked "Defendants' Exhibit 175".*]

This upper stapling machine as first put out was constructed substantially as shown in patent No. 1,011,592, December 12, 1911, Drey (application filed October 3, 1910). Typical claims of this patent are the following: —

"9. A machine of the class described having, in combination, staple forming and inserting means arranged to insert a staple through the upper and insole channel lip of a lasted shoe while these parts are in their original lasted condition, and means constructed and arranged to enter into the angle of union between the feather of the insole and the channel lip for forcing the upper into said angle in advance of the staple inserting operation."

"13. A machine of the class described having, in combination,

fastening inserting means constructed and arranged to insert a fastening through the upper and insole channel lip of a lasted shoe, and means for forcing the upper into the angle of union between the channel lip and the feather of the insole before the fastening inserting operation begins, constructed to guide the fastening during the fastening inserting operation in such manner that it is inserted through the upper and channel lip above the path of operation of the needle of the welter."

The method which is practiced in the manufacture of shoes, comprising as a step the insertion of staples by this upper-stapling machine, is defined in all of the ten claims of patent No. 1,023,555, April 16, 1912, Drey (application filed October 3, 1910), of which claims the first is typical: —

"1. That improvement in the art of making shoes which consists in lasting the upper over the edge of the sole and securing it in lasted position by temporary fastening means, permanently uniting the upper and the sole by inserting individual fastenings through the upper and channel lip of the sole while the shoe is in its original lasted condition, removing the temporary fastening means, and then uniting the upper and sole with stitches."

The shoe, which is produced by the method defined in the claims of patent No. 1,023,555, and in the manufacture of which this upper-stapling machine is used, is defined in all of the eight claims of patent No. 1,068,867, July 29, 1913, Drey (application filed December 13, 1910). A typical claim of this patent is the eighth:

"8. A shoe, comprising an upper and an insole, staples of fine wire attaching said upper to said insole, a welt attached to said upper and insole by stitches which also serve to unite the upper and insole, said staples being located inside the inseam trimming line and having their outer ends covered by the welt and their inner ends covered by the inner channel lip."

Stapling Machine — Model B: Goodyear Upper.

In the operation of the upper-stapling machine, as first put out, the workmen would sometimes, through carelessness, so operate the machine that a staple was not fully driven. To make the machine proof against improper operation through carelessness, and to incorporate other improvements which had been devised for the machine, it was reorganized and a new type of machine known as

"Stapling Machine, Model B, Goodyear Upper", was adopted on November 21, 1911. This reorganized machine embodies improvements defined in all of the seven claims of patent No. 1,059,984, April 29, 1913, Erickson and Cosgrove (application filed October 10, 1912), which shows the machine substantially as put out at the present time. A typical claim of this patent is the following:—

"1. A machine for attaching an upper to the channel lip or rib or shoulder of a sole, comprising, in combination, automatic staple inserting means, automatic staple forming means organized to form a staple after the operation of the inserting means and during the same cycle of operations of the machine, and to stop with the staple held in position to be acted upon by said inserting means during the next cycle of operation of the machine, means for pressing together the parts to be united and manually controlled means connected to said pressing means to operate said pressing means and having provision for further movement, after said pressing means has been operated, to actuate said automatic inserting means to cause said inserting means to drive the staple which has previously been formed by and is held in said forming means."

This reorganized machine adopted in November, 1911, as already stated, embodies further improvements, on which patents have not as yet been granted.

This upper-stapling machine, which performs an operation never before performed in the manufacture of shoes either by hand or by machine, affords shoe manufacturers several important practical advantages.

First, by the use of the machine a substantial saving is effected through avoidance of breakage of welter needles, which was caused frequently, usually a number of times every day, in the operation of each welt-sewing machine by the striking of the needle against a stay tack.

Second, since the staples are of fine wire and are not visible in the finished shoe, it is not necessary to remove them, and, in fact, it is desirable to leave them in the shoe, as they reinforce the inseam. Accordingly, the operation of pulling stay tacks is rendered unnecessary by the operation of the machine, effecting a saving to the manufacturer of the cost of the operation of pulling stay tacks.

Third, since the staples are inserted before the lasting tacks are pulled, there is no opportunity for the upper to slip out of position. In the method of manufacturing shoes generally followed prior to the introduction of this upper-stapling machine, it was the usual practice to allow shoes to stand for twenty-four hours after they had been lasted before pulling the lasting tacks, in order that the upper might become "set", to avoid slipping back of the upper and undoing to that extent of the lasting operation when the lasting tacks were pulled and the stay tacks inserted. When the upper-stapling machine is used it is not necessary to wait until the upper is "set", because the staples are inserted before the lasting tacks are drawn, and effectively hold the upper so that the lasting tacks can immediately be pulled without any delay after the lasting operation. As the shoe can immediately be welted after the lasting and stapling operation, there is a saving in the average shoe factory of at least twenty-four hours of the time formerly required in the manufacture of the shoe, which, among other advantages, increases substantially the efficiency of the manufacturer's supply of lasts.

By way of concrete illustration of the benefits derived by the manufacturer from the use of the Goodyear upper-stapling machine, in one factory where about 3000 pairs of shoes are made every day, and which is fully equipped with the upper-stapling machines, the saving which has been, and is now being, effected by the use of this machine, due chiefly to preventing the breakage of welter needles, to dispensing with the operation of pulling stay tacks and to saving of time and labor, amounts to from twenty dollars to thirty dollars per day.

Pulling Machine: Goodyear Upper Tack.

Since when the Goodyear upper-stapling machine is used there are no stay tacks to be pulled, the only tack-pulling operation which is needed is the pulling of the lasting tacks, and the United Company has developed, and supplies to manufacturers for use in connection with the upper stapling machine, a machine known as the "Pulling Machine, Goodyear Upper Tack", which comprises sub-

stantially the same tack-pulling organization as the pulling and resetting machine, Goodyear tack, which has been discussed in an earlier portion of this answer. All of the claims which have been referred to in connection with patents defining the organization of the tack-pulling and resetting machine, which are directed to the tack-pulling mechanism of that machine, define mechanisms which are embodied in this machine, pulling machine, Goodyear upper tack. Those patents are:—

No. 746,306, December 8, 1903, Eaton.

No. 960,294, June 7, 1910, Eppler.

No. 1,011,773, December 12, 1911, Hadaway (application filed September 9, 1905).

No. 1,013,944, January 9, 1912, MacKenzie (application filed April 8, 1911).

No. 1,049,474, January 7, 1913, Hadaway (application filed April 8, 1911).

The organization of this machine also is broadly defined in claim 25 of patent No. 864,532, August 27, 1907, Hadaway, as follows:—

"25. In a machine for preparing shoes for sewing, the combination with a tack pulling tool, of a downhold bearing against the edge of the upper inside and adjacent to the line of tacks to be pulled, substantially as described."

Of the machines which I have been discussing, the company had put out, up to March 1, 1913, the end of the company's last fiscal year, 123 pulling and resetting machines, Goodyear tack, and 156 of the stapling machines, Goodyear upper. Two of the upper-stapling machines have an average capacity equal to that of five or six welt-sewing machines.

Pulling Machine: Goodyear Insole Tack.

Another tack-pulling operation must be performed upon the shoe before the out-sole can be attached. In the manufacture of probably all welt shoes which are made the insole is secured to the last before the assembling and pulling over operations, which precede the lasting operation, by means of tacks which must be pulled before the out-sole is attached. Such tacks are shown in many

of the defendants' exhibits, of which one is Defendants' Exhibit No. 7.

At the same time that these insole tacks are removed from the shoe, stay tacks, if any were inserted when the lasting tacks were removed, must also be pulled.

Prior to February, 1899, there was no commercial machine offered to shoe manufacturers for performing either of these operations, that is, the pulling of insole tacks or the pulling of stay tacks, and it was at that time the universal practice to remove insole and stay tacks by hand tools.

In 1904 the inventors of the United Company began experimental work with a view to producing a machine for pulling insole and stay tacks. The production of a machine for performing these operations presented serious problems because the insole tacks are driven with their heads either flush with the face of the insole or imbedded below the surface and their points are driven well into the last. The pulling of the stay tacks also presented an entirely different problem from that of pulling lasting tacks, because while the lasting tacks are, in the lasting operation, always inserted with their heads projecting around the shank and forepart of a welt shoe, so that the tool of a lasting tack-pulling machine can readily get under the heads of the tacks, the welt is attached to the shoe after the stay tacks have been driven, and at the time when the stay tacks are to be removed their heads are often flush with, or below, the adjacent edge of the welt. Accordingly, a machine for pulling stay tacks must be so organized that the tack-removing tool can dig down below the projecting edge of the welt to get under the head of the stay tack, while at the same time the operation must be so performed as to avoid any liability of damaging the inseam or the welt.

The United Company's inventors were at work on these problems for some five years. After this long period of experimenting there was finally produced in February, 1909, a commercial machine which embodied the better part of the various improvements which had been made in a number of experimental machines which had been built from time to time during the experimentnl period.

This machine was known as "Pulling Machine, Goodyear Insole Tack". Although the machine was put into commercial use, as stated, in February, 1909, it had not even then reached its final commercial form as it is now put out, and several different types of tools for pulling both the insole tacks and the stay tacks were used on the machine, in turn, for more than a year. As finally put out the machine in its ultimate commercial form, and as it is now being put out, embodies mechanisms defined in the claims of a number of patents. Both the insole tack-pulling tool and the stay tack-pulling tool in all forms in which the tools have been used since the machine was first put out in February, 1909, embody an improvement defined in reissue patent No. 13,581, June 24, 1913, Miller (original patent 897,003, August 25, 1908). Claim 2 of this reissue patent is as follows: —

"2. In a tack pulling machine for lasted shoes, the combination of a rotary shaft, a wheel on said shaft having a circumferentially grooved periphery, and an extract or blade on said wheel extending crosswise of its periphery, for the purpose set forth."

An important characteristic of the insole tack-pulling mechanism is defined in the claims of patent No. 968,755, August 30, 1910, Eppler, of which a typical claim is the fifteenth: —

"15. A machine for pulling insole tacks from a lasted shoe, having, in combination, a tack pulling tool provided with a working end shaped to dig into the sole of a shoe and pass beneath the head of a tack, mechanism for actuating the tool to dig into the sole and engage a tack and pull the tack from the shoe, and means for securing the proper presentation of the shoe to the tool."

Passing over several patents defining in their claims forms of tack-pulling tools which were used for a while and then superseded, the insole tack-pulling mechanism as finally adopted and now used in the commercial machine is defined in the claims of patent No. 995,670, June 20, 1911, Hadaway, of which typical claims are the first and fourth: —

"1. A rotary tack pulling tool, having, in combination, a puller provided with a transverse tack pulling edge and an eccentric periphery back of said edge, a guard flange at one side of the puller, and means permitting adjustment of the puller across the axis of rotation of the tool, substantially as described."

"4. A rotary tack pulling tool, having, in combination, a puller provided with a transverse tack pulling edge and an eccentric periphery back of said edge, and a guard flange at one side of the puller provided with an opening for the ejectment of waste materials, said opening having its end at the heel of the puller beveled outwardly to assist the materials in passing out, substantially as described."

In patent No. 1,016,328, February 6, 1912, Hadaway (application filed April 14, 1909), which disclosed an insole tack-pulling tool used only experimentally, is a claim which defines an improvement embodied in the commercial insole tool, as follows: —

"9. A tack pulling machine, having, in combination, a tack pulling tool provided with a blade extending crosswise of its periphery and having a convex edge adapted to dig under the head of a sole tack, and a work supporting guard, substantially as described."

The commercial form of said tack puller is shown in the drawings of patent No. 1,028,455, June 4, 1912, Hadaway (application filed February 23, 1910), and defined in all of the five claims of that patent. Typical claims which indicate the problems which had to be solved in the production of a commercially satisfactory stay tack-pulling device, and also indicating the solution of the problems in the commercial machine, are the first and second, which are as follows: —

"1. A rotary tack pulling tool provided with one or more tack pulling blades, and guard flanges projecting beyond their working edges between which the inseam is fed longitudinally, substantially as described.

"2. A rotary tack pulling tool provided with tack pulling blades, guard flanges on opposite sides of the blades projecting beyond their working edges between which the inseam is fed longitudinally, and an intermediate flange to press on the inseam beyond which the working edges of the blades project, substantially as described."

This machine is put out by the United Company through its Goodyear Department, and at the end of the company's last fiscal year, March 1, 1913, there had been put out, since the introduction of the machine in 1909, 318 of these machines, pulling machine, Goodyear insole tack. One of these machines will take care of the output of five or six welting machines when the machine is used to pull both the insole and stay tacks. In factories where the Good-

year upper-stapling machine is used, so that there are no stay tacks to be pulled, this insole tack-pulling machine will remove the insole tacks from shoes which have been welted on a larger number of welt-sewing machines.

PULLING AND TRIMMING MACHINE: INSOLE TACK AND TURN SHOE.

The machines which have heretofore been discussed in this answer were devised and are adapted particularly for use on welt shoes. After these machines had been developed into commercial form and were being supplied to manufacturers, the inventors of the United Company directed their attention to the development of a machine for pulling lasting tacks from turn shoes. The lasting tacks on turn shoes present different problems for a machine from the lasting tacks of welt shoes. In the first place, in the lasting of turn shoes the lasting tacks must not be driven through the sole, since, if they were, the tacks would pass out of the sole on the grain side, forming holes in the grain side of the sole, which would deface it and seriously impair the appearance and salability of the finished shoe. Also, a much lighter lasting tack is used, lighter even than the stay tacks which were formerly, and are still to some extent, inserted in welt shoes after the pulling of the lasting tacks.

The first commercial machine ever produced, so far as I know, for the pulling of lasting tacks from turn shoes was put out by the United Company on December 6, 1911, being known officially as "Pulling and Trimming Machine, Insole Tack and Turn Shoe". The lasting tack-pulling mechanism of this machine is shown in the drawings, described in the specifications and defined in the four claims of patent No. 931,946, August 24, 1909, Miller. Typical claims of this patent are the following:—

"1. A rotary tack pulling wheel provided with a peripheral groove, with a tack pulling blade extending across said groove, and with a recess to admit a tack fed transversely to the wheel into the path of the blade."

"3. A rotary tack pulling wheel provided with a spiral groove on its periphery and with a plurality of tack pulling blades extending across said groove."

In addition to this patent No. 931,946 several of the patents which have been referred to in connection with pulling machine, Goodyear insole tack, contain claims defining mechanisms embodied in this machine for pulling lasting tacks of turn shoes. These patents are:

Reissue No. 13,581, June 24, 1913 (original patent No. 897,003, August 25, 1908), Miller.

No. 968,755, August 30, 1910, Eppler.

No. 995,670, June 20, 1911, Hadaway.

No. 1,016,328, February 6, 1912, Hadaway (application filed April 14, 1909).

Of the machines which have been discussed in the foregoing answer, the following machines are put out by the United Company through its pulling over department:—

"Trimming Machine, Model A, Rex Upper", superseded by

"Trimming Machine, Model H, Rex Upper",

while the other machines discussed are put out by the United Company through its Goodyear department, namely:—

"Pulling and Resetting Machine, Goodyear Tack";

"Stapling Machine, Goodyear Upper", superseded by

"Stapling Machine, Model B, Goodyear Upper";

"Pulling Machine, Goodyear Upper Tack";

"Pulling Machine, Goodyear Insole Tack";

"Pulling and Trimming Machine, Insole Tack and Turn Shoe".

Mr. WEBSTER. The answer is objected to because the same relates to matters in reference to which no evidence has been introduced by the petitioner, and therefore the answer relates to matter which is inadmissible, incompetent and irrelevant as to any of the issues involved herein. The answer is further objected to because it does not relate to matters in reply to, or in defence of, evidence introduced before the examiner by the petitioner. The petitioner further objects to the answer in so far as it relates to mechanisms not shown in patents and referred to in the claims of such patents as were issued prior to the filing of the petition herein.

Int. 100. Have you collected under one cover the patents referred

to by you in your last answer as relating to upper trimming and tack-pulling machines?

Ans. I have.

Int. 101. Will you please produce it?

Ans. I produce a volume comprising all of the patents mentioned by me in my testimony relating to upper trimming and tack-pulling machines.

[*Volume of patents relating to upper trimming and tack-pulling machines is introduced in evidence, and marked "Defendants' Exhibit 176".*]

Mr. WEBSTER. The petitioner objects to the introduction as exhibits of all patents issued after the date of the filing of the petition herein.

Int. 102. Will you please give the number, date and name of the patentee of the several patents contained in the volume which has just been introduced in evidence as Defendants' Exhibit 176?

Ans. No. 746,306, December 8, 1903, Eaton.

No. 864,532, August 27, 1907, Hadaway.

No. 897,003, August 25, 1908, Miller (reissued).

Reissue No. 13,581, June 24, 1913, Miller (original patent No. 897,003, August 25, 1908).

No. 922,697, May 25, 1909, Hadaway.

No. 931,946, August 24, 1909, Miller.

No. 960,294, June 7, 1910, Eppler.

No. 961,200, June 14, 1910, Ashton.

No. 968,553, August 30, 1910, Hadaway.

No. 968,554, August 30, 1910, Hadaway.

No. 968,755, August 30, 1910, Eppler.

No. 995,670, June 20, 1911, Hadaway.

No. 1,011,592, December 12, 1911, Drey (application filed October 3, 1910).

No. 1,011,773, December 12, 1911, Hadaway (application filed September 9, 1905).

No. 1,013,944, January 9, 1912, MacKenzie (application filed April 8, 1911).

No. 1,016,328, February 6, 1912, Hadaway (application filed April 14, 1909).

No. 1,023,555, April 16, 1912, Drey (application filed October 3, 1910).

No. 1,028,455, June 4, 1912, Hadaway (application filed February 23, 1910).

No. 1,049,474, January 7, 1913, Hadaway (application filed April 8, 1911).

No. 1,059,984, April 29, 1913, Erickson and Cosgrove (application filed October 10, 1912).

No. 1,068,867, July 29, 1913, Drey (application filed December 13, 1910).

[*Adjourned to 10* A. M. *Friday, October 17, 1913.*]

BOSTON, MASS., October 17, 1913.

Int. 103. To bring the unlasted upper of a shoe into its lasted position what operations, if any, are necessary besides the operation performed by the lasting machine which you have already described? If any further operations are necessary, please state what they are, how they were performed prior to 1899, and what, if anything, has been done by the United Company since 1899 to provide shoe manufacturers with machines for performing such operations. If such machines form the subjects-matter of Letters Patent of the United Company, state the patents.

Mr. WEBSTER. The question is objected to by counsel for the petitioner because of its calling for evidence or testimony in reference to matters which have not been touched upon in the evidence or testimony submitted by the petitioner and being in no sense in reply to, or in defence of, evidence of the petitioner.

PULLING OVER.

Ans. In the manufacture of practically all shoes it is necessary that the shoe be "pulled over" before it goes to the lasting machine. The operation of pulling over a shoe comprises pulling the upper over the last by means of grippers on each side of the forepart near the tip seam and at the toe, and securing the upper at

these points by tacks. Before the upper is secured the workman must carefully inspect the upper and assure himself that the "lines" of the upper are properly located on the last; that is, the tip seam must be straight and must at all points be at the proper distance from the end of the toe, and the lacing slit must not be pulled out of its proper position toward either side of the shoe. As this operation was performed just prior to February, 1899, it was exclusively a hand operation. In performing the operation the workman would first pull the upper at the toe by hand pincers and tack it at that point; then pull the upper on one side and fasten it there, pull the upper at the other side and fasten that portion of the upper, and next turn the shoe over to examine the tip seam and lacing slit to determine whether they were properly located. If the tip seam were not straight, or not properly located, as above explained, at the same distance at all points from the end of the toe, or if the upper were distorted so as to displace the lacing slit, he had to remove one or more, sometimes all, of the tacks which he had driven to secure the upper and try again, sometimes repeating this operation several times before the lines of the upper were properly located on the last. This operation is critical because it is at this time that the lines of the upper are permanently fixed.

It was the almost universal opinion in the industry prior to 1899, and, in fact, for several years after that date, that this operation of pulling over the shoe was the one operation in the manufacture of shoes which could never be performed by machine, owing to the necessity for adjusting the lines of the upper during the pulling-over operation. However, the Consolidated and McKay Lasting Machine Company had, some time prior to the formation of the United Shoe Machinery Company in February, 1899, undertaken to produce a pulling-over machine if it were possible to develop a machine which would perform the operation acceptably.

Postponing for later detailed discussion the problems which had to be dealt with in the production of a commercial pulling-over machine, I will now refer briefly to the successive steps in the experimental work toward the production of a pulling machine

which could be successfully used to perform this critical operation in the manufacture of shoes. The experimental work, begun by the Consolidated & McKay Lasting Machine Company, was taken up by the United Shoe Machinery Company immediately after its organization in February, 1899, and by September, 1899, a machine was produced, the third experimental machine which had been constructed, which was deemed worthy of a shoe factory trial. From that machine were prepared drawings of patent No. 633,777, December 11, 1900, McFeely. While the experimental use of this first machine of September, 1899, was sufficient to demonstrate that there was hope of producing a machine which would be commercially successful, the machine itself fell short of commercial success. Continuous experimental work was done upon the machine, and its next stage is represented by patent No. 950,701, March 1, 1910, McFeely (application filed October 31, 1901). A number of experimental machines constructed as shown in the drawings of this patent No. 950,701 were put out for shoe factory trials under commercial conditions. The lessons learned in the experimental use of these machines led to the development of the machine in its third stage, and in June, 1903, there was put out a machine constructed as shown in patent No. 1,029,387, June 11, 1912, McFeely (application filed March 28, 1903).

Pulling Over Machine — Model A: Rex.

When this machine was produced the pulling-over machine was, for the first time, an assured success. Up to this time, June, 1903, the ultimate success of the pulling-over machine had been problematical. All pulling-over machines put out by the United Company since June, 1903, have embodied practically all of the mechanisms set forth in the claims of this patent No. 1,029,387.

Referring now to some of the many serious problems which had to be dealt with in the development of a commercially pulling-over machine, probably the most important were, first, the provision of practical means for adjusting the upper on, and in relation to, the last, after the upper had been put under pulling strain, to properly locate the lines of the upper so that the tip seam would be straight

and would be located at all points at the same distance from the end of the toe, and to assure proper location for the lacing slit; and, secondly, the general problem of performing all of the machine's operations, the pulling of the upper, the adjusting of the upper while under strain, and the securing of the upper in properly adjusted condition in such manner and so quickly that it would be advantageous to use the machine instead of pulling over by hand.

The first of these problems was met, in the first commercially successful machine shown, as I have stated, in patent No. 1,029,387, June 11, 1912, McFeely (application filed March 28, 1903), by so organizing the machine that the two pairs of grippers which simultaneously pulled the upper on opposite sides adjacent to the tip seam could be quickly operated to adjust the upper in any desired manner over, and with relation to, the last. The grippers could thus be manipulated either to straighten a misplaced tip seam or to adjust into proper position an incorrectly located lacing slit. The second of the problems above referred to was met by so organizing the machine that it pulled at the toe and on opposite sides of the shoe substantially simultaneously and, after the upper had been adjusted, simultaneously wiped the portions of the upper held by the grippers over upon the bottom of the last, and simultaneously drove tacks at the toe and at both sides of the shoe to hold the upper in pulled-over position. Each of these operations was performed almost instantaneously with a dwell between the two groups of operations to afford opportunity for adjustment of the upper while held under strain by the grippers.

The general principles of operation above indicated were all present in the experimental machine of the first patent, No. 663,777, December 11, 1900, but in the experimental use of that machine and of its successor, the machine of patent No. 950,701, March 1, 1910 (application filed October 31, 1901), it was found that many changes in, and additions to, the organization of the machine of each patent in turn must be made to adapt the machine for commercial use.

An explanation of all the improvements which had to be made

before the experimental machine of patent No. 663,777 was developed into the commercial machine which was produced, as has been stated, in June, 1903, and was constructed as shown in patent No. 1,029,387, and the reasons why each improvement had to be made, and how it solved the problems which it was to meet, would be a long story. It will, perhaps be sufficient to quote claims of patents disclosing the more important features of the organization of the machine of June, 1903. These patents were as follows:—

No. 663,777, December 11, 1900, McFeely.

No. 791,986, June 6, 1905, McFeely.

No. 950,701, March 1, 1910, McFeely (application filed October 31, 1901).

No. 988,582, April 4, 1911, McFeely (application filed October 31, 1901).

No. 1,029,387, June 11, 1912, McFeely (application filed March 28, 1903).

No. 1,030,264, June 18, 1912, McFeely (application filed October 31, 1901).

No. 1,030,522, June 25, 1912, McFeely (application filed March 28, 1903).

This machine of June, 1903, also borrowed from the hand-method lasting machine art some features of its mechanism which are defined in the claims of patents—

No. 597,321, January 11, 1898, Ladd;

No. 893,331, July 14, 1908, Ladd (application filed April 13, 1901);

No. 910,251, January 19, 1909, Wheeler (application filed August 7, 1901.

Nearly all of the 186 claims of the first patent on the above list, No. 663,777, December 11, 1900, McFeely, deseribe mechanism embodied in the commercial machine of 1903 and always since incorporated in the machine. Typical claims are as follows:—

"1. A pulling over machine comprising in combination means for pulling the upper at different points, means for placing said pulled upper over the inner sole, means for securing said overturned upper to the inner sole, the combination being adapted for

working on uppers placed loosely over a last, whereby said uppers are pulled over the last and secured at different points in position for lasting."

"28. A pulling over machine comprising means for automatically pulling the upper first longitudinally of the last and then transversely of the last."

"76. A last supporter adapted for resting on the bottom of a last, in combination with means for pulling the upper over the last, and independent means, becoming operative after the upper is pulled, to support the last against the operations of securing the upper to the inner sole."

"170. Means for pulling an upper over a last, combined with means for moving said pulled upper around said last longitudinally.

"171. Means for pulling an upper over a last, combined with means for moving said pulled upper around said last transversely."

"173. A pulling over machine comprising means for stretching the upper over and holding it upon the last, with means for adjusting the pulled over upper on the last."

A majority of the ninety-four claims of patent No. 950,701, March 1, 1910, McFeely (application filed October 31, 1901), described mechanisms embodied in the commercial machine of 1903, and always since incorporated in the machine. Typical claims are the following: —

"12. In a machine of the class described, means to engage an upper, and means to sink the last into the upper and to actuate the last longitudinally during the sinking movement."

"20. Means for pulling an upper over a last at opposite sides of the shoe simultaneously, in combination with automatic means for moving an inner sole upon the last."

"31. In a pulling over machine, mechanism for pulling an upper over a last, combined with means for clamping the pulled over upper against the inner sole, and mechanism for securing the upper to the inner sole."

"52. In a machine of the class described, the combination with means for pulling an upper over a last, of a plurality of pressers, actuating mechanism comprising independently yielding means cooperating with each presser for forcing the pressers against the upper on opposite sides of the last and means for insuring uniform pressure on each side of the last."

All of the sixty-six claims of patent No. 1,030,264, June 18, 1912, McFeely (continuation of application filed October 31, 1901), describe mechanisms embodied in the commercial machine of 1903,

and always since incorporated in the commercial pulling-over machine. A typical claim of this patent is the fifty-third: —

"53. In a gripper mechanism, jaws for gripping and pulling stock, and actuating mechanism therefor constructed and arranged to be disconnected from the jaws while the stock is under tension."

Nearly all of the forty-two claims of patent No. 988,582, April 4, 1911, McFeely (original application filed October 31, 1901), recite mechanisms embodied in the commercial machine of 1903, and always since incorporated in the commercial machine. Claim 2 of this patent is as follows: —

"2. In a machine for working an upper over a last, the combination with a wiper, automatically operating means to actuate the wiper inwardly and downwardly for wiping the upper over the bottom of the last, and means for supporting the last unyieldingly to the action of the wiper, of means for allowing variation of the altitude of the wiper in relation to the bottom of the last during the overwiping operation."

Over 100 claims of patent No. 1,029,387, June 11, 1912, McFeely (application filed March 28, 1903), which shows, as already stated, the first really successful commercial pulling-over machine, describe mechanisms which have always been embodied in the machine ever since it was adopted. One of the most important improvements in the organization of the machine set forth in the claims of this patent was a rest for the heel of the last which was self-adjustable to adapt it for properly supporting the rights and lefts of crooked lasts, and which was automatically movable into and out of proper position for engaging and supporting the heel end of a shoe. This improvement overcame a difficulty which had been experienced in the experimental use of the earlier models of the pulling-over machine, owing to the backward strain exerted upon the last by the toe grippers, the toe wiper and the mechanism for driving the tacks at the toe, all of which tended to force the last backwardly. Operators of the earlier machines had endeavored to meet this strain by grasping the shoe at the heel with one hand, but this taxed the operator's strength unduly and, moreover, he frequently did not hold the shoe firmly enough to prevent objectionable backward movement of the last. Such slipping back of

the last interfered with practically every operation performed by the machine and prevented satisfactory pulling over. That difficulty was completely overcome by the improvements of this patent No. 1,029,387 which made the machine commercially satisfactory. This improvement, and other important improvements, are set forth in more than 100 of the claims of this patent No. 1,029,387, of which the following are typical: —

"2. A pulling over machine having, in combination, means for gripping an upper at the toe and at opposite sides of the forepart and pulling it over a last, a rest for the heel of the last, and means for automatically pressing said rest forwardly into position to support the last against longitudinal rearward displacement by the toe pulling means."

"13. In a pulling over machine, means for pulling an upper over a last, in combination with last supporting means having inclined contact faces for engaging opposite sides of the last, and means for automatically actuating said supporting means into engagement with the last, said supporting means being automatically adjustable laterally according to the position of the portion of the last engaged thereby."

"33. Means for pulling an upper over a last, in combination with automatic means adapted for moving an inner sole upon the last, said means being arranged for adjustment to move the inner sole either forwardly or backwardly."

"106. A pulling over machine having, in combination, pulling over means, and shoe supporting means which includes a rest for the heel end face of the last."

The mechanism described in patent No. 1,030,522, June 25, 1912, McFeely (application filed March 28, 1903), and set forth in the claims of that patent, comprises means for so actuating the grippers as to pull the uppers away from the edge of the last while it is being stretched, in order to reduce the friction on the upper and prevent the liability of curling upward the edge of the insole, and also comprises two pairs of grippers for engaging the upper on each side, with means for equalizing the strain of each pair on the same side so that they shall operate alike.

Of the forty-nine claims of this patent, typical claims are the seventh and twelfth: —

"7. In a pulling over machine, grippers for gripping an upper

and pulling it over a last, means for relatively actuating the grippers and last for pulling the upper, and means for holding the upper away from the edge of the last while it is being pulled."

"12. In a grippers mechanism for pulling an upper over a last, a plurality of pairs of grippers for engaging the same side of the upper, a single operating means for closing and lifting said grippers, and equalizing means whereby the several pairs of grippers are caused to put the different portions of upper acted upon under the same strain."

Proceeding now to a discussion of the improvements which have been made in the pulling-over machine as put out for commercial use in 1903, and as shown in patent No. 1,029,387, the development of the machine during 1904, 1905 and 1906 and the improvements adopted in the machine from time to time during that period are shown and described in the claims of the following patents: —

No. 959,874, May 31, 1910, McFeely (application filed October 12, 1906).

No. 1,001,701, August 29, 1911, Spencer (application filed August 15, 1907).

No. 1,002,421, September 5, 1911, McFeely (application filed May 26, 1904).

No. 1,002,422, September 5, 1911, McFeely (application filed October 12, 1906).

No. 1,007,766, November 7, 1911, Ashton (application filed August 2, 1907).

In 1908 and 1909 further improvements were made in the machine and have ever since been embodied in the regular organization of the machine, upon most of which patents have not been granted but for which it is expected that patent protection will eventually be obtained. All of the improvements made between 1903 and 1911 were adopted in the commercial pulling-over machine as soon as each improvement in turn had been embodied in commercially satisfactory mechanism. The commercial machine of 1911, embodying all of these improvements, was renamed "Pulling Over Machine, Model A, Rex", upon the introduction of the new model C machine, to which I shall presently refer.

Patents which have so far been granted, setting forth the organization of the model A pulling-over machine, are as follows: —

No. 597,321, January 11, 1898, Ladd.

No. 663,777, December 11, 1900, McFeely.

No. 791,986, June 6, 1905, McFeely (application filed September 19, 1899).

No. 893,331, July 14, 1908, Ladd (application filed April 13, 1901).

No. 910,251, January 19, 1909, Wheeler (application filed August 7, 1901).

No. 950,701, March 1, 1910, McFeely (application filed October 31, 1901).

No. 959,874, May 31, 1910, McFeely (application filed October 12, 1906).

No. 988,582, April 4, 1911, McFeely (application filed October 31, 1901).

No. 1,001,701, August 29, 1911, Spencer (application filed August 15, 1907).

No. 1,002,421, September 5, 1911, McFeely (application filed May 26, 1904).

No. 1,002,422, September 5, 1911, McFeely (application filed October 12, 1906).

No. 1,007,766, November 7, 1911, Ashton (application filed August 2, 1907).

No. 1,029,387, June 11, 1912, McFeely (application filed March 28, 1903).

No. 1,030,264, June 18, 1912, McFeely (application filed October 31, 1901).

No. 1,030,522, June 25, 1912, McFeely (application filed March 28, 1903).

No. 1,030,838, June 25, 1912, Ashton (application filed August 2, 1907).

PULLING OVER MACHINE — MODEL C: REX.

In March, 1911, there was first put out for commercial use a pulling-over machine which embodied so many improvements that it was designated as a new model, and is known as "Pulling Over Machine, Model C, Rex". While the fundamental principles of operation of the earlier types of the machine were continued in the

new model as set forth in all of the claims which I have quoted in this answer, there are incorporated in it many valuable improvements for which as yet but one patent has been granted. This patent is No. 1,055,016, March 4, 1913, Brothers (application filed September 23, 1908), claims of which describe in broad terms one of these improvements. Typical claims of this patent are the sixth and twenty-third: —

"6. A pulling over machine having in combination, side grippers, manually operable tip straightening means, and means including a single actuating member, adapted for movement by the operator to relieve the tension on the upper during the operation of the tip straightening means."

"23. In a pulling over machine the combination with oppositely disposed side grippers and power mechanism for operating them, of means, including a single actuated member, which may be employed by the machine operator at will to modify the rate at which the power driven side gripper pulling movement shall take effect."

The improvements broadly defined in this patent No. 1,055,016, March 4, 1913, Brothers, are embodied in the "New Model C Pulling Over Machine" in different mechanical constructions embodying many further improvements upon which it is expected that patent protection will eventually be obtained. Further improvements in the model C machine comprise provision for inserting more tacks on the outside of the shoe, where more are needed, than on the inside of the shoe, and means by which the operator can at will modify or, if desired, arrest the pulling by the grippers during their operation, which enables him to modify the straining action of the grippers in accordance with the needs of each shoe. These improvements, and others which are embodied in the model C machine which is now the United Company's standard commercial pulling-over machine for welt work, are not yet patented. It is anticipated, however, that patents will eventually be granted for all of these improvements. Since the introduction of the model C machine, which, as has been stated, is now the standard machine for welt work, the model A machine has been the standard machine for McKay sewed work. A reorganized machine for McKay sewed work, embodying all the improvements incorporated in the model

C machine which were adapted for a machine used on McKay sewed work, has recently been developed. This new machine has been adopted as a commercial machine and a number of these machines are in the course of construction and will shortly be supplied to manufacturers of McKay sewed shoes.

The organization of the model C pulling-over machine embodies mechanism set forth in the claims of all of the sixteen patents which have been enumerated as defined in the organization of the model A machine, except patent No. 1,030,838, and in addition to this patent the model C machine embodies the improvements set forth in patent No. 1,055,016, March 4, 1913, Brothers.

PULLING OVER MACHINE — MODEL B: REX.

In July, 1910, there was adopted for commercial use a combined pulling-over and lasting machine for turn work, which was the result of more than three years of constant experimenting. This machine is known as "Pulling Over Machine, Model B, Rex", and comprises improvements which are in part substituted for mechanisms on the model A pulling-over machine, and in part are additions to the organization of that machine. The machine comprises, generally speaking, means for pulling over a shoe and means for automatically lasting the forward portion of the shoe and securing it in lasted position, and mechanisms embodied in this machine are described in the claims of most of the patents which have been referred to in the discussion of the pulling-over machine, but no patents have yet been granted on the organization of a combined pulling-over and lasting machine, or upon the many improvements which have made this machine a commercially successful machine as a combined pulling-over and lasting machine for turn work. It is anticipated, however, that the machine will eventually receive patent protection.

All of the sixteen patents which have been enumerated as defining mechanisms embodied in the model A machine also define the organization of the model B machine except Nos. 1,007,766 and 1,030,838. In addition to those patents the model B machine embodies improvements set forth in the claims of patents numbered

584,192, June 8, 1897, Preston, and 999,327, August 1, 1911, McFeely.

I produce a McKay sewed shoe which was pulled over on the model A pulling-over machine.

[*McKay sewed shoe pulled over on model A pulling-over machine is introduced in evidence, and marked "Defendants' Exhibit 177".*]

[*Answer to Int. 103 continued:*]

I also produce a welt shoe which has been pulled over upon the model C pulling-over machine.

[*Welt shoe pulled over on the model C pulling-over machine is introduced in evidence, and marked "Defendants' Exhibit 178".*]

[*Answer to Int. 103 continued:*]

The shoe which I now produce is a turn shoe which has had its forepart pulled over and lasted on the model B pulling-over machine.

[*Turn shoe having forepart pulled over and lasted on the model B pulling-over machine is introduced in evidence, and marked "Defendants' Exhibit 179".*]

[*Answer to Int. 103 continued:*]

In concluding the discussion of the pulling-over machine it may be well to state that interesting facts about this machine are: that it performs operations which, in February, 1899, and always before, had been performed by hand; that it performs these operations much better than they were ever performed by hand; that the nature of the operation is such that the machine is the most elaborate and highly organized machine now used in the manufacture of shoes; that nearly a million dollars was spent in the development of the machine before any revenue was derived from it; and that while each machine does enough work to supply at least two, and frequently three, lasting machines of any type in use, the demand for the pulling-over machine has been so great that 4180 machines had been put out prior to October 1, 1913; and that in its early years the development of the machine was so rapid that after an entirely successful machine had been produced the United Company voluntarily supplied the successful machine to manufacturers who had machines of the earlier models, and broke up for junk over

100 machines which had been built and put out less than three years before.

This machine is put out by the United Shoe Machinery Company through its pulling-over department.

While the pulling-over machine performed the greater and most important part of the work in preparing a shoe for the lasting operation, there still remained the operation of assembling the parts of shoes preparatory to the pulling-over operation, which still, after the introduction of the pulling-over machine, had to be performed by hand as it was performed in February, 1899, and always before that time. In fact, this assembling operation, together with the pulling operation, constituted portions of the work performed by the hand laster before the introduction of lasting machines.

ASSEMBLING.

Prior to the operation of the pulling-over machine, the parts of the shoe, comprising an insole, the upper and its lining, and a counter, which, as explained in my previous testimony, is a piece of stiffening material, as sole leather, inserted between the upper and lining to maintain the shape of the heel end of the upper during the wear of the shoe, must be gotten together about the last, adjusted to their proper relations, and secured at one or more points; and this step in the manufacture of the shoe is known as "assembling".

ASSEMBLING SPINDLE: REX.

As stated, this operation was always performed by hand until September, 1904, when the United Company first put out for commercial use a machine known as "Assembling Spindle, Rex", which represented the first step in the development of the present commercial assembling machine, and was constructed as shown in the drawings and described in all of the six claims of patent No. 893,-696, July 21, 1908, Ashton (application filed October 20, 1905). A typical claim of this patent is the first:—

"1. A machine for assembling parts of boots and shoes preliminary to lasting, comprising a last pivot arranged to support a last normally for free pivotal movement in an approximately horizontal

plane, and clamping mechanism arranged to hold the upper against the last at the heel and to hold the last simultaneously from movement upon said pivot."

While I have called the device shown in this patent No. 893,696 a machine, it was really an assembling spindle, as indicated by its name and by the claim which has just been quoted. It comprises a so-called "jack-spindle", on which the last was mounted, and a device for forcing the upper materials, including the counter, against the rear end of the last and holding the upper materials in that position while the operator drove tacks by hand through the upper, the flange of the counter, the lining and the insole. While this assembling spindle was useful in the hand operation of assembling, and over 200 of them were put out before the development of the present commercial machine, and while very likely manufacturers would still be using this assembling spindle if it had not been superseded by the present highly-organized commercial assembling machine, it seems today very crude in comparison with that machine. It did not automatically fasten the upper; it did not force the upper materials, including the flange of the counter, in over the bottom of the last at the rear end to prepare the upper materials to receive the fastening tack, and hence it rendered no assistance to the operator in shaping the edge of an unflanged counter; and, further, it rendered no assistance to the operator in holding the forward ends of the counter, and preventing frequent misplacing, which, as will be later explained, is an important function of the present commercial assembling machine.

ASSEMBLING MACHINE: REX.

In view of the crude character of this assembling spindle, and the desirability of an organization which would perform automatically all of the operations which, as I have just stated, the assembling spindle did not and could not perform, the United Company inventors proceeded to develop an organized power-operated assembling machine. Such a machine was produced and was first put out for commercial use in September, 1905. This was the first commercial machine ever constructed or used for assembling on a last the several parts of the upper in their proper relations to each

other and to the last, and securing such parts in their proper relations. Furthermore, this new machine performed all of these operations automatically. It held the forward ends of the counter closely pressed against the sides of the last, pressed the counter and upper into close relation to the heel end of the inner sole, drove a tack through the upper and counter into the rear end of the last to secure the parts against displacement relatively to each other or to the last, and it forced the upper materials and the edge of the counter over the rear edge of the last down upon the bottom of the last, and drove a tack through these parts and through the insole, clinching the end of the tack on the iron heel plate of the last, thus producing a shoe having its parts assembled on the last in proper relation to each other and ready for the pulling-over operation.

This assembling machine as first put out in September, 1905, was constructed substantially as shown in the drawings and as set forth in nearly all of the forty-eight claims of patent No. 1,023,-794, April 23, 1912, Ashton (application filed August 15, 1906). Of those claims of this patent which describe broadly the organizations of both the original machine of 1905 and the present commercial assembling machine, typical claims are the first and thirtieth: —

"1. A machine for assembling an upper, a counter and a sole, having in combination means for adjusting relatively said upper, counter and sole and means for securing said upper, counter and sole together at the heel."

"30. A machine of the class described having in combination means for securing together an upper and an inner sole sustained upon a last, and means for securing the upper to the rear end of the last."

Assembling Machine — Model E: Rex.

As the result of experimental work begun soon after the first machine had been put into commercial use, the assembling machine was reorganized to incorporate many improvements, and the reorganized machine was first put out in August, 1910, being known as "Assembling Machine, Model E, Rex", and this new machine soon superseded the earlier model. In the reorganized machine

means was provided for insuring that the tack which, as I have explained, was driven through the upper and counter into the rear end of the last to secure the upper materials from displacement relatively to the last, should be accurately located. This improvement was important because it is desirable, first, that this counter tack shall be driven near the rear seam of the upper, while, secondly, the tack must not be driven through that seam, as in almost every instance it would cut the thread and injure the shoe if it were driven through the seam.

The new machine of 1910 was also organized to wipe the upper along the sides of the shoe upon its heel end to points on each side of the shoe adjacent to the forward ends of the counter. This operation aids materially in drawing the upper smoothly around the end of the last and in preventing the forward ends of the counter from becoming misplaced by bending down below the insole and frequently being caught by the insole with a consequent loss of time on the part of an operator who must raise the ends of the counter into proper position before the shoe is lasted.

The reorganized machine of 1910, which is the present commercial machine, is constructed substantially as shown in patent No. 1,026,940, May 21, 1912, Ashton (application originally filed December 26, 1907), and embodies mechanisms defined in all of the thirty claims of that patent, of which claims 2 and 22 are typical:—

"2. A machine of the class described, having in combination, mechanism for inserting a fastening in the rear face of a shoe, and means for determining the position in the width of said face at at which the fastening is inserted."

"22. A machine of the class described, having in combination, means for supporting a last and parts to be assembled arranged loosely upon the last, means for adjusting the upper forwardly along the sides of the last at the heel and for holding the ends of the counter against the sides of the last, and means for thereafter securing the upper to an inner sole mounted upon the last."

Other mechanisms embodied in the present commercial assembling machine are described in the claims of patent No. 1,000,660, August 15, 1911, Ashton, and No. 1,026,067, May 14, 1912, Ashton (application filed November 30, 1908).

The improvement of the first of these patents, No. 1,000,660, enabled the machine to operate satisfactorily in assembling shoes upon lasts of different lengths. This improvement made the machine universal by rendering it capable of satisfactory use upon all sizes and kinds of lasts. All of the ten claims of this patent No. 1,000,660 define this improvement in its commercial form, and a typical claim is the first: —

"1. A last support, having a supporting member for engaging the cone of a last and means for positioning the last in the direction of its length upon the supporting member, said means being adjustable into two different positions whereby the area of the bearing surface of said member that engages the last at the rear of the positioning means may be varied to suit lasts of different lengths, and means for locking said positioning means in either position of adjustment."

The method which is practiced in operation of the assembling machine is stated in the claims of an allowed application filed October 26, 1907. The patent will be granted on this allowed application on next Tuesday, October 21, 1913. According to the method set forth and claimed in this allowed application, the inner sole is supported on a bottom of a last, the upper and counter are arranged about the last, and the ends of the counter are held inwardly against the sides of the last, so that the forward ends of the counter are prevented from becoming misplaced, and particularly are prevented from being forced down below the plane of the last bottom, which would otherwise usually be caused by the subsequent pressure exerted by the machine on the rear end of the counter so that the operator would have to pull up and properly locate the ends of practically every counter before the lasting operation. In the next step of the method the counter is pressed against the rear face of the last and against the rear edge of the inner sole, so that the parts of the shoe at this point are brought into their proper relation to each other, and the counter and upper are thereafter forced inwardly from the bottom of the last at the rear end and are secured together. Parts of the shoe are now in proper relation to each other and to the last, and the shoe is ready for the pulling over and the subsequent operations. A typical claim of this

allowed application on which, as I stated, the patent will issue on October 21, 1913, is the first: —

"1. The method of assembling parts of boots and shoes which consists in supporting an inner sole upon the bottom of a making last, arranging an upper and counter about the last in unsecured relation thereto, holding the ends of the counter against the sides of the last, then pressing the counter against the rear face of the last adjacent to its tread face and against the rear edge of the inner sole, pressing the counter against the face of the inner sole and thereafter securing the counter to the inner sole."

This machine is extensively used by shoe manufacturers, over 1800 having been put out since the machine was introduced in September, 1905. The machine is so automatic in its action that a skilled workman is not required for its operation, and most machines are operated by girls. The operation of the machine upon a McKay shoe is illustrated in Defendants' Exhibit 177, which exhibit illustrates the operation of the assembling machine at the rear end of the shoe, and the operation of the pulling-over machine in the forepart of the shoe. A welt shoe which has been operated upon by the assembling machine is shown in Defendants' Exhibit 178. In this exhibit, also, the rear portion of the shoe has been operated upon by the assembling machine, while the forepart illustrates the operation of the pulling-over machine.

The assembling machine is put out by the United Company through its pulling-over department.

Pounding, Blocking and Trimming.

In addition to the assembling machine, other auxiliary machines of the pulling-over department which are supplied with the pulling-over machine as a part of the pulling-over system, are: —

"Pounding Machine, Model E, Rex";

"Pounding and Trimming Machine, Model B, Rex Rotary";

"Pounding Machine, Model C, Rex Rotary";

"Pounding and Beating Up Machine, Model A, Rex".

The general object of these machines is to perform the final operations formerly performed by a hand workman during and as a part of the lasting operation. The projecting bunches of upper

material on the shoe bottom at the heel and at the toe caused by the folding or puckering of the upper during the lasting would interfere with the proper attachment of the outsole, and at the toe end of a welt shoe would also interfere with the proper attachment of the welt, as has been fully explained in my previous testimony in regard to the upper-trimming machine which has been developed and put out by the United Company. On a McKay sewed shoe it is the custom to cut off the excess upper stock at the toe and then to pound the bottom of the shoe at the heel and toe, and sometimes all the way around the bottom of the shoe, to smooth down and level the bottom before attaching the out-sole. On welt shoes it is the practice to pound the bottom of the shoe at the heel end and to trim off the excess material at the toe before the operation of attaching the welt, this trimming operation on welt shoes now being performed by trimming machine, model H, Rex upper, which has been discussed in my previous testimony. All of these pounding and trimming operations, like the operation now performed by the pulling over and assembling machine, were a part of the operations of hand lasting before the introduction of lasting machines, and in February, 1899, the pounding and trimming was done by hand by the lasting machine operator, as a part of the lasting operation.

Prior to 1904 it was the universal practice to trim off the excess upper stock at the toe of a McKay sewed shoe by cutting it off with a hand knife, and it was also the general practice to beat down the folded or puckered upper stock at the heel, and that remaining at the toe after the trimming operation, by pounding the stock at the heel and toe with a hammer. It was also customary for the workman to hammer more gently, and to rub with the hammer, the upper stock around the heel and toe adjacent to the bottom of the last, for the purpose of shaping the upper stock, including the box toe at the toe, and the stiff counter at the heel, to define more sharply the angle of union adjacent to the edge of the last, and particularly at the heel where it is desired to force the counter as closely as possible to the last. The operation on

the bottom of the shoe was known as "pounding", and the operation on the side of the shoe was known as "blocking".

POUNDING MACHINE: REX POUNDING MACHINE — MODEL E: REX.

In 1904, the United Company first put out for commercial use a machine then named "Pounding Machine, Rex", which was constructed substantially as shown in the drawings, described in the specifications and set forth in the claims of patent No. 1,019,067, March 5, 1912, McFeely (application filed August 15, 1904). This machine was organized with a hammer arranged to strike an oblique inward blow on the shoe bottom and to move inwardly over the stock, and with a blocking tool to engage the upper close to the bottom of the last adjacent to the point where the blow of the hammer was struck, and operating simultaneously with the hammer. Typical claims of this patent No. 1,019,067 are the following: —

"1. A machine of the class described, having in combination, devices constructed and arranged to engage the upper on the bottom and side of a shoe substantially to its edge, and automatic actuating means for causing said devices to form the upper against the inner sole and side of the last and to shape the edge of the shoe."

"3. A machine of the class described having, in combination, devices for engaging contiguous portions of upper material on the bottom and side of a shoe, and automatic actuating means for causing said devices to force said portions respectively downwardly and inwardly with relation to the last for shaping the edge of the shoe."

The machine described and shown in the claims above quoted, and more specifically in many other claims of that patent, successfully solved the problem of substituting automatic mechanical means for the inclined drawing blow of the hammer in the operator's hand, and it improved upon the hand operation because it treated both the bottom and sides of the shoe simultaneously at the same point, while the hand workman had to treat them at different times. Prior to 1904 there was no machine in the industry for pounding the bottoms and blocking the sides of shoes, either welt or McKay sewed.

The United Company owns a number of patents which describe

in their claims the mechanisms of this machine in broader terms than those above quoted. These patents, and typical claims of each, are as follows: No. 731,168, June 16, 1903, Eaton: —

"1. A heel seat and counter-beating machine, having in combination, a suitable jack for supporting a lasted shoe, a hammer for beating the heel seat of such shoe, a hammer for beating the counter thereof, and connected mechanism for operating the hammers, substantially as described."

No. 893,440, July 14, 1908, Carter (application filed April 3, 1899): —

"30. In a machine of the class described, a pounder movable to force the upper inwardly from the edge of the inner sole and downwardly toward the inner sole, a carrier for the pounder, means for actuating the carrier and pounder together to effect one of said movements of the upper, and means for actuating the pounder relatively to the carrier to effect the other movement of the upper."

No. 910,251, January 19, 1909, Wheeler (application filed August 2, 1901): —

"54. In a machine of the class described, the combination with a pounder, of means for positioning the shoe, and means for actuating the pounder upwardly away from the shoe and then toward the shoe in a path inclined downwardly and inwardly with relation to the shoe bottom, the machine having provision for effecting a yielding engagement of the pounder with the shoe."

No. 1,018,526, February 27, 1912, Snow (application filed July 9, 1904): —

"31. In a machine of the class described, the combination with pounding-up means, of mechanism for actuating said pounding-up means into and out of engagement with the work, and other means for moving said pounding-up means forwardly over the work."

Reissued patent No. 12,825, July 7, 1908, Kron (original patent No. 733,974, July 21, 1903): —

"9. In a machine for beating the upper on the bottom of a shoe, the combination, with a beating device, of means for actuating said beating device downwardly toward the shoe bottom and inwardly away from the edge of the shoe bottom, and then upwardly away from the shoe in a different path."

When this machine was used on shoes having sharply inclined

shanks it was found that the blocking tool, which was properly shaped for the heel and toe, but was not shaped to fit such shanks, was liable to injure the upper in the shank. Accordingly, in 1906, there was adopted in the machine an improvement which was aimed to overcome this difficuity and which enabled the operator to render the blocking tool inoperative upon the shank. This improvement is defined in the seventh claim of patent No. 1,048,788, December 31, 1912, Ashton (application filed June 16, 1908), as follows: —

"7. In a machine of the class described, the combination with means for pounding a shoe and means for blocking the shoe, of means for rendering one of said means inoperative while the other means continues in operation."

Other mechanisms set forth in the claims of this patent No. 1,048,788 were used for a time and were then superseded in 1907 by improvements set forth in the claims of patent No. 1,030,751, June 25, 1912, Shattuck (original application filed December 17, 1906). The nature of this improvement is well set forth in the tenth claim of that patent: —

"10. In a machine of the class described, the combination with pounding up means and means for actuating it to force the upper on the bottom of a shoe downwardly and inwardly away from the edge of the shoe, of rollers arranged on either side of the pounding up means to engage the upper on the side of the shoe, and means for actuating the rollers to rub the upper adjacent to the edge of the shoe."

In 1906 this pounding machine was named officially "Pounding Machine, Model E, Rex", and from the time of its adoption in 1904 until the adoption of pounding and trimming machine, Rex rotary, in July, 1908, 650 of the Rex pounding machines had been put out. One of these machines will take care of the output of from six to eight lasting machines of any type in commercial use.

Trimming Machine: Rex Toe.

In the first part of this answer it was stated that before the operation of the pounding machine on the toe of a McKay shoe it was desirable to remove the surplus stock left at the toe at the end of

the lasting operation. Prior to 1904 the operation of trimming off the surplus stock at the toe had always been performed by hand. In the latter part of 1904 the United Company offered to manufacturers the first commercial machine for performing this operation, which was known as "Trimming Machine, Rex Toe". The general problems which had to be met in the production of a machine for performing this operation were, first, to present the shoe for the operation of cutting in such manner that only the proper amount of excess stock would be removed; and, secondly, to provide an organization for the machine which would enable it to remove the excess stock satisfactorily without undoing the work of the lasting machine. The second problem was met, and substantial progress was made toward the solution of the first problem, by the organization of this Rex toe-trimming machine as it was first put out. It was then constructed as shown in the drawings of patent No. 891,130, June 16, 1908 (application filed June 26, 1905), and as set forth in all of the twenty-two claims of that patent, of which typical claims are the following: —

"6. In a toe trimming machine, the combination with a cutter, of a gage having an acting portion shaped to receive the toe part of a shoe and to permit projections on said toe part to extend outwardly from the plane of said acting portion and arranged to maintain the shoe normally out of the path of the cutter and to move with the shoe to permit said projections to be brought within the path of the cutter."

"21. In a toe trimming machine, the combination with means for positioning the toe part of a shoe, of means for trimming projecting portions of the upper from said toe part by the separation from the shoe of successive layers of stock progressively from the toe tip toward the heel."

In the use of the machine constructed as shown in the drawings of patent No. 891,130 it was found that this organization was not readily adaptable for operation upon toes of varying widths. Accordingly, in September, 1906, the machine was improved by embodying in its organization the mechanism shown in the drawings and described in the eight claims of patent No. 891,131, June 16, 1908, Ashton. The most important of the improvements defined in the claims of this patent was means automatically adjust-

able by the shoe to present toes of different widths in the same manner for the operation of the cutter. A typical claim is the seventh: —

"7. A machine for reducing projecting portions of an upper upon the bottom of a shoe at the toe, having in combination a tool for separating from the shoe the surplus material to be removed, a gage formed to engage the bottom of the shoe at the toe and to project inwardly over the edge of the shoe, and arranged to present the projecting portions of the upper to the tool and constructed for adjustment in width to receive shoes varying in size, and means for adjusting said gage actuated by the movement of the shoe into operative relation to the gage."

This trimming machine, Rex toe, had a capacity which enabled it to trim the toes of shoes which had been lasted on from eight to twelve lasting machines of any type which was in commercial use. Four hundred and forty-two of the machines had been put out prior to July, 1908, when, as will be later explained, the machine was combined with a new type of pounding machine.

Pounding and Trimming Machine: Rex Rotary.

Pounding and Trimming Machine — Model B: Rex Rotary.

The pounding machine which had been discussed in the earlier part of this answer and which was known as "Pounding Machine, Model E, Rex", was the standard pounding machine for both McKay sewed and welt work for some four years. In July, 1908, it was superseded, for McKay sewed shoes, by a machine known as "Pounding and Trimming Machine, Rex Rotary", and later, as I shall explain, it was also superseded for welt work.

This first pounding machine, now known as "Pounding Machine, Model E, Rex", which, as I have explained, was the first machine for performing the pounding operations formerly done by hand, and which performed these operations effectively, required a "jack" or work support, because the operation of the pounding mechanism of that machine was strictly a mechanical operation and the blows were too hard to be resisted by the hands of the operator alone. In view of the desirability of a machine which would not require a work support, and in the operation of which no time

would be lost in jacking the shoe, experimental work was undertaken by the United Company with a view to producing a machine of radically different organization which would do as good work as the original Rex pounding machine and which would not require a work support.

After some two years of experimental work, including the usual trying out of experimental machines in different shoe factories, there was adopted for commercial use and offered to manufacturers in July, 1908, a machine known as "Pounding and Trimming Machine, Rex Rotary". The machine as first put out was constructed substantially as shown in the drawings and described in the claims of patent No. 1,030,837, June 25, 1912, Ashton (application filed December 12, 1907), and the first machine embodied mechanism defined in substantially all of the forty-one claims of that patent, which also define the organization of the present commercial machine. Of the claims of this patent, the fourth and twenty-ninth indicate the characteristic construction and mode of operation of the machine. These claims are as follows: —

"4. In a machine of the class described, a rotary shoe beater comprising a carrier and beating members arranged about the periphery of the carrier, each member consisting of a plurality of rings mounted for swinging movement about their connection with the carrier."

"29. In a machine of the class described, a rotary shoe beater comprising a carrier and an annular series of beating members movable bodily outwardly with relation to the carrier from an inoperative position to an operative position by centrifugal force when the beater is rotated."

The blocking of a shoe, that is, the light hammering and rubbing of the sides of the upper adjacent to the insole was provided for in this machine by the organization shown in the drawings of patent No. 1,019,878, March 12, 1912 (application filed November 19, 1908). Of the ten claims of this patent defining the blocking mechanism of this machine, the first is typical: —

"1. A machine of the class described, having in combination, means for treating the bottom of a shoe, means for resting the side of the shoe during the bottom treating operation, and actuating mechanism for said two means, said resting means being constructed

and arranged to be operatively connected with its actuating means to beat the side of the shoe at the will of the workman without interrupting the operation of the machine in beating a shoe."

The principle of operation of this side beating or blocking mechanism of this machine is broadly set forth in claim 3 of patent No. 768,560, August 23, 1904, Casgrain, which is as follows: —

"3. In a machine of the class described, a leather working tool, and means for imparting to said tool a succession of rapid blows when said tool is in contact with the stock, said means being arranged and constructed to cease actuating the tool when the tool is out of contact with the stock."

The organization of this machine, including combined pounding and blocking tools, is set forth in broad terms in the claims of patent No. 1,019,067, March 5, 1912, McFeely (application filed August 15, 1904), typical claims of which patent have previously been quoted in the earlier part of this answer in the discussion of "Pounding Machine, Model E, Rex".

For the convenience of the operator the toe-trimming machine, known as "Trimming Machine, Rex Toe", which also has been discussed in an earlier part of this answer, was combined with the pounding and blocking organization of this machine so that the pounding operations of trimming the toe and pounding the shoe bottom could be performed by the operator while standing before one machine. Accordingly, this machine, "Pounding and Trimming Machine, Rex Rotary", included the organization of the Rex toe-trimming machine which has already been discussed, and which, as I have stated, is set forth in the claims of patent No. 891,130, June 16, 1908, Ashton, and patent No. 891,131, June 16, 1908, Ashton.

In December, 1901, the bottom-pounding organization of this machine was improved by incorporating the mechanism illustrated in the drawings and set forth in all of the nine claims of patent No. 1,003,434, September 19, 1911, Covell. In March, 1910, a radically new toe-trimming mechanism was adopted for this machine, which is shown in the drawings and described in nearly all of the twenty-six claims of patent No. 1,054,656, February 25, 1913,

McFeely (application filed April 18, 1910). A typical claim of this patent is the fifth : —

"5. A machine for removing surplus stock from boots or shoes or parts thereof, comprising a hollow abading tool having perforations adapted to permit passage to the interior of the tool of waste particles taken from the stock by the abrading surface, a shoe support to present the toe portion of the shoe for the operation of said tool, and means for drawing a current of air through the interior of said tool."

After the adoption of the new toe-trimming mechanism of this patent No. 1,054,656, this was offered to shoe manufacturers alternatively with the toe-trimming mechanism of the Ashton patents Nos. 891,130 and 891,131, previously discussed.

This pounding and trimming machine, Rex rotary, became, immediately after its introduction, the standard pounding and trimming machine for McKay sewed shoes. It had the advantage over the original pounding machine, pounding machine, model E, Rex, that it did not require jacking of the shoe, since it was organized to strike about 28,000 light blows per minute instead of 800 to 1200 heavy blows per minute struck by the old machine, and it had the further advantage for manufacturers of McKay shoes that it performed the two operations of trimming the toe and pounding the bottom of the shoe and saved the floor space which formerly had been required for two machines to perform those two operations separately. This new machine also added to the operative's convenience by enabling him to perform these two operations, that is, trimming of the toes and pounding and blocking of the bottom and sides, while standing before the same machine. Accordingly, manufacturers of McKay sewed shoes generally preferred this new machine of which 931 had been put out after its adoption in 1908 up to September 1, 1913. One of these rotary pounding and trimming machines will easily trim the toes, pound the bottoms and block the sides of all the shoes lasted upon two hand-method lasting machines.

To illustrate the operation of this machine I produce a McKay shoe which has been lasted, but has not yet been operated upon. The necessity of trimming the toe and then pounding the toe, and

of pounding the bottom of the heel end of the shoe before attaching the out-sole will be obvious.

[*Lasted McKay shoe before trimming and pounding operations is introduced in evidence, and marked "Defendants' Exhibit 180".*]

[*Answer to Int. 103 continued:*]

I also produce a lasted McKay shoe which has been operated upon by the Rex rotary pounding and trimming machine and which has had the excess material removed from the toe by the trimming operation of that machine, and has been pounded all around the bottom of the shoe and has had its sides blocked by that machine. The improvement effected by the operation of the machine will be obvious upon comparing this shoe with that of Defendants' Exhibit 180.

[*Lasted McKay shoe which has been operated upon by Rex rotary pounding and trimming machine is introduced in evidence, and marked "Defendants' Exhibit 181".*]

POUNDING MACHINE — MODEL C: REX ROTARY.

[*Answer to Int. 103 continued:*]

This rex rotary pounding and trimming machine was not, however, adapted for welt work, because in welt work the lasting tacks adjacent to the heel, as well as along the shank and forepart, must be left with their head ends projecting from the stock to facilitate pulling them, as is illustrated in Defendants' Exhibit 149. There was no way in which this machine could be used on welt shoes without danger either of ripping out these tacks or of tearing up the lasted upper from the insole. Accordingly, the original pounding machine, model E, Rex, introduced in 1904, as has been explained, was continued as the standard machine for pounding heel seats of welt shoes, until the introduction in March, 1912, of "Pounding Machine, Model C, Rex Rotary".

This machine was a reorganization of pounding and trimming machine, Rex rotary (now designated as "Model B"), to adapt that machine for welt work. The mechanisms set forth in the claims of all the patents which I have previously discussed in this answer in connection with pounding and trimming machine, Rex

rotary, are embodied in this new model C machine for welt work, except the mechanisms described in the claims of the three patents —

No. 891,130;

No. 891,131, and

No. 1,054,656,

which relate to the toe-trimming mechanisms of the model B rotary pounding and trimming machine which were adapted for use upon McKay shoes only.

In addition to the patents, mechanisms of which are common both to the model B machine and the model C machine, the model C machine embodies mechanisms adapting it particularly for welt work, which are defined in six claims of patent No. 1,010,550, December 5, 1911, Wentworth; three claims of patent No. 1,030,751, June 25, 1912, Shattuck (original application filed December 17, 1906); and all ten claims of patent No. 1,032,356, July 9, 1912, Ashton (application filed September 11, 1911).

Referring to typical claims of these patents, claim 3 of patent No. 1,010,550 is as follows: —

"3. A machine for shrinking and ironing the upper of a lasted shoe, having, in combination, a heated ironing roll shaped to treat different portions of the upper of the shoe, means for applying viscous material to the heated roll, and means for driving the roll to rub and heat the upper and automatically to distribute the viscous material over the surface of the upper engaged by the roll to prevent injury to the leather by the heated roll."

The third claim of patent No. 1,030,751 is as follows: —

"3. In a machine of the class described, the combination with a stationary support, a roller mounted thereon and formed and arranged to engage the side of a shoe adjacent to its edge, of means for actuating the roller to remove wrinkles or surface inequalities from the upper at and adjacent to the edge of the shoe."

Among the claims of patent No. 1,032,356 which set forth the purpose of the mechanism illustrated in the drawings of that patent and embodied in this model B machine are the following: —

"1. In a machine of the class described, a beater, a horizontal

work resting member, and an adjacent vertical abutment between the horizontal member and the beater, arranged to serve as a guard to prevent the beater from engaging and forcing toward the edge of the last bottom the upper on the lower side of the heel seat while the beater is forcing inwardly the upper on the upper side of the heel seat."

"5. In a machine of the class described, a beater, a rest for engagement with one side of the heel portion of the shoe while the heel seat at the other side is being beaten, and vertical stops at each lateral side of said rest in position to engage the rear partially driven side lasting tacks of a lasted shoe and guide the operator in so presenting the shoe to the beater that the portions of the upper, held by the side lasting tacks, will be prevented from engagement with the beater."

This machine, pounding machine, Rex rotary, model C, is now the standard commercial machine for pounding heel seats of welt shoes, which is the class of work for which the machine was especially designed and to which its field is limited.

I produce a welt shoe which has been operated upon at its heel end by this machine, which also illustrates at its toe end the operation of trimming machine, model H, Rex, which has been discussed in my previous testimony.

[*Welt shoe operated upon by pounding machine, Rex rotary, model C, and by trimming machine, model H, Rex upper, is introduced in evidence, and marked "Defendants' Exhibit 182".*]

POUNDING AND BEATING UP MACHINE — MODEL A: REX ROTARY.

[*Ans. to Int. 103 continued:*]

In March, 1912, there was first supplied for commercial use a machine for pounding and beating up the soles of turn shoes, which, while a development of pounding and trimming machine, Rex rotary, model B, is a reorganization of that machine particularly adapting the new machine for turn work. This machine is officially known as "Pounding and Beating Up Machine, Model A". The mechanism which particularly adapts this machine for turn work is not shown or described in any patents which have as yet been granted, but it is anticipated that patent protection will eventually be obtained for these improvements. The machine em-

bodies mechanisms set forth in the claims of the following patents:—

No. 764,569, July 12, 1904, Erickson.

No. 768,560, August 23, 1904, Casgrain.

No. 1,003,434, September 19, 1911, Covell.

No. 1,010,550, December 5, 1911, Wentworth.

No. 1,019,067, March 5, 1912, McFeely (application filed August 15, 1904).

No. 1,030,751, June 25, 1912, Shattuck (application filed December 17, 1906).

No. 1,030,837, June 25, 1912, Ashton (application filed December 12, 1907).

To illustrate the operation of this pounding and beating-up machine, model A, I produce a turn shoe having its sole attached, which has not been operated upon by this machine.

[*Turn shoe before operation of pounding and beating machine, model A, is introduced in evidence, and marked "Defendants' Exhibit 183".*]

[*Answer to Int. 103 continued:*]

The shoe which is Defendants' Exhibit 183 is a right shoe; I now produce a left shoe of that pair which has been operated upon by pounding and beating-up machine, model A.

[*Turn shoe after operation of pounding and beating-up machine, model A, is introduced in evidence, and marked "Defendants' Exhibit 184".*]

[*Ans. to Int. 103 continued:*]

The demand for this model A machine is limited. It was especially designed and built to supply a demand for such a machine from manufacturers in the Philadelphia territory.

All of the machines which have been discussed in the foregoing answer are put out by the United Company through its pulling-over department.

Mr. Webster. The petitioner respectfully calls the attention of the court to the fact that the foregoing answer is largely in the nature of argument; that it contains reference to what others thought, said and did, and statements in reference to alleged

mechanisms and machines of applications for patents now pending, and reference to mechanisms of patents issued after the filing of the petition herein; that it contains statements as to what is contemplated, what alleged experiments and experimental machines have been made, and expenses involved in experiments; and also contains statements as to the opinion of the witness. And all statements of the witness in reference to said matters are objected to as inadmissible, incompetent and immaterial, as having no bearing on the questions at issue herein, and as in no sense in reply to, or in defence of, any evidence or matters offered by the petitioner; and counsel for petitioner reserves the right to, after the record shall have been transcribed by the stenographer, call attention specifically to the matters objected to and to move that the same be stricken from the record.

Int. 104. Have you collected under one or more covers the patents referred to by you in your last answer; if so, will you please produce them, and as you produce them state briefly to which of the machines referred to by you the patents contained in the several volumes relate?

Ans. I produce, first, a volume of patents mentioned in the portion of my testimony relating to the several models of the pulling-over machine.

[*Volume of patents relating to pulling-over machine is introduced in evidence, and marked "Defendants' Exhibit 185".*]

[*Answer to Int. 104 continued:*]

I also produce a volume comprising copies of patents which are mentioned in the portion of my testimony relating to assembling machines.

[*Volume of patents relating to assembling machines is introduced in evidence, and marked "Defendants' Exhibit 186".*]

[*Answer to Int. 104 continued:*]

I also produce a volume of copies of patents mentioned in the portion of my preceding answer relating to pounding machines and toe-trimming machines.

[*Volume of patents relating to pounding machines and toe-trim-*

ming machines is offered in evidence, and marked "Defendants' Exhibit 187".]

Mr. WEBSTER. The petitioner objects to the introduction of patents issued after the date of the filing of the petition herein.

Int. 105. Please give the number, date and name of patentee of the several patents referred to in the volumes of patents which have just been offered in evidence as Defendants' Exhibits 185, 186 and 187.

[*Adjourned to Tuesday, October 21, 1913, 10* A. M.]

BOSTON, MASS., October 21, 1913.

Int. 106. In answer to a previous question propounded to you by counsel for petitioner you referred to the following sole-leveling machines: —

"Leveling Machine, Goodyear Welt and Turn (Turn Work)";

"Leveling Machine, Hercules";

"Leveling Machine, Atlas".

Please state the field in the leveling machine art occupied by each of these machines, and if these machines as put out by the United Shoe Machinery Company embody improvements which are the subjects-matter of Letters Patent of the United Company, refer to such improvements and state the patents.

LEVELING MACHINES: TURN, ROLLING PRESSURE AND DIRECT PRESSURE.

Ans. In my previous testimony relating to leveling machine, Goodyear automatic sole, I have explained that the purpose of the leveling operation is to impart to the bottom of the sole the shape which is desired in the finished sole, and that this desired shape is imparted by means of pressure after the sole has been attached to the shoe. The Goodyear automatic leveling machine is especially designed and adapted for leveling soles of welt shoes, and it is used exclusively on welt shoes. Because it exerts too heavy a pressure for turn shoes, and also because it is not organized to impart pressure of the particular kind, and in the particular manner required for turn shoes, as I shall later explain, it is never used for leveling turn shoes, and the United Company puts out for leveling turn shoes a machine especially designed for that work and adapted for its peculiar conditions, which is known as "Leveling Machine, Goodyear Welt and Turn (Turn Work)".

The other two machines referred to in the question are the two which the United Company puts out for leveling shoes other than welt and turn shoes.

Leveling machine, Hercules, is of the rolling-pressure type and is adapted and put out for leveling heavy shoes, such as men's McKay

sewed shoes and shoes having their soles attached by screws, nails or pegs.

The other machine, leveling machine, Atlas, is of the direct pressure type and is adapted and used for leveling lighter weight McKay sewed shoes, and practically all women's, misses' and children's McKay sewed shoes have their soles leveled on the Atlas leveling machine.

LEVELING MACHINE: GOODYEAR WELT AND TURN (TURN WORK).

Referring now the machine which the United Company puts out for leveling turn shoes, "Leveling Machine, Goodyear Welt and Turn (Turn Work)", which was first put out in June, 1906, the organization of that machine is shown in patent No. 1,004,155, September 26, 1911, Eppler (application filed May 3, 1906), with the improvements shown and described in patent No. 996,707, July 4, 1911, Eppler; No. 916,021, March 23, 1909, Rigby; and No. 925,509, June 22, 1909, Rigby.

A characteristic feature of this machine is the leveling roll, which is especially designed to meet conditions peculiar to the leveling of turn shoes. As explained in my previous testimony, a turn shoe is a light weight shoe having but one sole, and while on the one hand the turn sole will not stand as much pressure as the welt sole and the action of the leveling tool must not be so hard as to injure the sole, unsupported as it is by an insole, on the other hand it is essential that sufficient force be exerted upon the sole, and in such manner, and on such portions, as effectively to beat down the seam which secures the sole to the upper, and to remove the wrinkles in the shank of the sole formed during the operation of turning the shoe right side out, which operation follows the operation of attaching the sole to the upper when the shoe is wrong side out. To meet these conditions this turn leveling machine comprises a leveling roll, which, unlike the smooth roll of the Goodyear automatic leveling machine, is formed with hammering and rubbing ribs, and also, unlike the roll of the automatic machine, the roll on the turn machine is positively driven, both of which characteristics contribute to its effective operation on turn

shoes. A ribbed roll is broadly described in the claims of patent No. 563,487, July 7, 1896, Howe, of which claim 1 is as follows:—

"1. In a beating-out machine, the combination with a rotary shaft of a beating-out roll provided with a series of fixed, rigid, longitudinal projections, separated sufficiently from each other to strike the sole, in the rotation of the roll, with distinct blows to work the leather of the insole as desired, substantially as described."

Ribbed rolls substantially like the rolls shown in the Howe patent were tried out by the United Company, but while the use of these rolls demonstrated the utility of ribs for beating down the seam, it was found that the roll needed improvements, first, because the action of the ribs was not uniform, and also because, owing to the shape of the ribs, as shown in Fig. 2 of the Howe patent, they struck too hard a blow and did not do enough rubbing. The roll of this Howe patent was improved upon in the first commercial machine put out for turn work in June, 1906, by the substitution of the roll shown and described in patent No. 1,004,155, September 26, 1911, Eppler, which shows the roll as provided with a series of rubbing and pounding projections or ribs, which are separated by slots of the same width throughout the length of the roll, and these ribs were constructed to do more rubbing and less hammering than the ribs of the roll of the Howe patent. This construction, which rendered the pounding action of the roll the same on all portions of the sole acted upon, is defined in several claims of that patent, of which claim 1 is typical:—

"1. A sole leveling roll, concave longitudinally, and provided with a series of slots of the same width throughout their length, dividing the roll into a series of sole rubbing and pounding projections or ribs, adapted to pound the sole in a substantially uniform manner throughout the length of the roll."

The general organization of the commercial machine as first put out and as now, with improvements, supplied to manufacturers, is defined in the claims of this patent No. 1,004,155, all of the fourteen claims of which define mechanisms embodied in the machine as it has been put out since its adoption and as it is now being put out.

The roll of the Eppler patent was, in turn, improved upon as

shown in the drawings and set forth in the claims of patent No. 916,021, March 23, 1909, Rigby. In the improved construction of this Rigby patent the middle portion of the roll was left smooth, so that the desired pounding effect could be secured along the edges of the sole over the seam without pounding the middle portion of the sole, where pounding was not needed, and where, in fact, it was undesirable, since it frequently stretched the sole lengthwise. The construction shown in this Rigby patent No. 916,021 is that now used on the commercial machine, and is defined in the five claims of this Rigby patent, of which claims 1 and 2 are typical: —

"1. A sole leveling roll provided at its centre with a smooth sole rubbing surface, and at its ends with a series of sole beating projections.

"2. A sole leveling roll provided at its centre with a smooth sole rubbing surface and at its ends with a series of sole beating projections arranged obliquely to the axis of the roll and adapted to exert an outward wiping action on the sole of a shoe."

The mechanism embodied in this machine whereby, when the roll is adjusted for different heights of lasts, the pressure mechanism is simultaneously adjusted so that substantially the same pressure will be exerted upon the sole, whatever the height of the last, is defined in all of the eight claims of patent No. 925,509, June 22, 1909, Rigby. A typical claim is the first: —

"1. A sole leveling machine, having, in combination, a shoe supporting jack and a sole leveling tool relatively movable both vertically and longitudinally, pressure mechanism for forcing one of said parts toward the other to exert pressure on the sole of the shoe, a stop to determine the proper relative vertical position of said parts when the leveling tool is disengaged from the shoe, means for adjusting said stop to position the parts properly for different shoes, and means acting simultaneously to adjust the pressure mechanism to cause it to exert substantially the same pressure on the different shoes."

In addition to the mechanisms defined in the claims of the patents already discussed, this turn leveling machine embodies improvements set forth in all of the four claims of patent No. 996,707, July 4, 1911, Eppler, and also embodies improvements on

which patents have not yet been granted, but for which it is anticipated that patent protection will ultimately be obtained.

This machine is put out by the United Shoe Machinery Company through its Goodyear department. Over two hundred of the machines have been put out since it was first introduced in 1906 up to March 1, 1913, the end of the United Company's last fiscal year. The field for the machine is somewhat limited, as only about thirteen per cent of the shoes made in this country are turn shoes.

Leveling Machines for Shoes Other than Welt and Turn Shoes.

Referring now to the machines which the United Company puts out for leveling shoes other than welt or turn shoes, it should first be explained that the leveling of McKay sewed or nailed shoes presents different problems from those which have to be dealt with in the leveling of welt or turn shoes. In the first place, when a welt or turn shoe is leveled it is still upon a wooden last, while the last has to be removed from a McKay sewed, or a nailed shoe, immediately after the lasting operation because the last cannot be in the shoe during the attaching of the sole by means of the McKay sewing machine, or a metallic fastening or pegging machine. Accordingly, during the leveling operation a McKay sewed, or a nailed, shoe has to be mounted upon an iron last or form which is a part of the leveling machine, and which, to facilitate the application and removal of the shoes, must fit the shoe somewhat loosely. Co-operating with that iron last or form, a sole pressing form must be used which is shaped to correspond with the contour which it is desired to impart to the sole by the leveling operation. It is not practicable, in leveling McKay sewed, or nailed shoes, to use a roll operating upon different portions of the sole successively, because, as has been explained, the iron last or form must fit the shoe more loosely than a wooden last and a roll operating first on one side of the sole and then on the other would displace the shoe on its loosely fitting form and would distort the sole. Accordingly, it is the universal practice to use leveling forms shaped to impart the desired shape to the sole, and machines of two types are used for

leveling soles of McKay sewed and nailed shoes, in both of which types the pressure is applied in a direction substantially perpendicular to the sole.

In one of these types, known as "rolling pressure type", the pressure is applied by oscillating the iron last or form which supports the shoe and a co-operating curved leveling form so that the pressure is applied progressively from the heel to the toe, and back from the toe to the heel, in lines extending clear across the sole. Leveling machine, Hercules, is of this type.

In the other type, known as "direct pressure type", the leveling pressure is applied to the sole by a form shaped to impart the desired contour and arranged for right line pressing movement relatively to the shoe so that the leveling pressure is exerted upon the entire face of the sole simultaneously. Of this type is leveling machine, Atlas.

LEVELING MACHINE — MODEL A: HERCULES.

The Hercules leveling machine, which is of the first type of the two types of leveling machines which I have just explained in general terms, is provided with two iron shoe-supporting forms or jacks and with two co-operating curved pressing forms which constitute two pairs of leveling mechanisms arranged to be operated alternately, and in each pair the jack and sole engaging form are given oscillatory movements so that they roll on each other and apply pressure to different narrow portions of the sole progressively from heel to toe, and back from toe to heel.

The Hercules leveling machine as now being put out commercially by the United Company embodies mechanism set forth in the claims of the following patents: —

No. 861,746, July 30, 1907, Mayo.

No. 884,144, April 7, 1908, Frasier.

No. 932,220, August 24, 1909, Winkley.

No. 944,620, December 28, 1909, Holt.

No. 982,267, January 24, 1911, Gouldbourn.

No. 997,798, July 11, 1911, Frasier.

The Frasier patent No. 884,144 represents the first stage in the

commercial development of this machine. Two characteristics of the commercial machine are set forth in the claims of this patent. The first is the organization of the machine by which the operator can control the number of oscillations of the form and thus determine the amount of the leveling action effected by the machine. This was new in machines of this type. The other feature is the organization by which the two pairs of jacks are thrown into operation alternately. In earlier machines of this type it had been necessary for the operator to actuate independently the mechanism for operating the jack and form constituting each pair of pressure-applying mechanisms. These important features of the Hercules leveling machine are defined in the first and sixth claims of the Frasier patent No. 884,144:—

"1. A sole pressing machine, having, in combination, a shoe supporting jack, a co-operating sole pressing form, mechanism acting continuously to move the jack and form to subject the sole of a shoe supported upon the jack to a plurality of rolling pressures and means controlled by the operator acting whenever it is put into operation to stop the jack and form with the jack in a position of presentation, substantially as described."

"6. A sole pressing machine, having, in combination, two shoe supporting jacks, two co-operating sole pressing forms, means for actuating each jack and form to subject the sole of a shoe supported upon the jack to a rolling pressure, and means for causing the jacks and their co-operating forms to be thrown into operation alternately, substantially as described."

The machine of this Frasier patent No. 884,144 was only an experimental machine, and but one machine was built. This experimental machine was entirely reorganized and the improvements incorporated in the machine by this reorganization as shown in patent No. 861,746, July 30, 1907, Mayo, which shows the commercial form of the machine as it was first put out in April, 1903. Among the more important improvemeuts set forth in the claims of this patent was means for counteracting the tendency of a machine of this type to work the sole forwardly during the leveling operation, a disadvantage which had limited the field of usefulness of machines of this type. Among the sixteen claims of this patent, all defining mechanisms embodied in the commercial machine

as first put out, and as it is being supplied to manufacturers today, a more notable claim is the third:—

"3. A sole pressing machine, having, in combination, a shoe supporting last, a sole pressing form, a last carrier, a form carrier, and mechanism for actuating said carriers to subject the sole of a shoe supported upon the last to a rolling pressure acting to draw the form over the sole while in contact therewith, substantially as described."

An important feature of the organization of the Hercules machine is defined in claim 5 of patent No. 932,220, August 24, 1909, Winkley, as follows:—

"5. A sole pressing machine, having, in combination, a plurality of shoe supporting jacks, a plurality of co-operative sole pressing forms, mechanism common to all the jacks and forms for actuating any jack and its co-operating form when connected therewith to subject the sole of a shoe supported upon the jack to a rolling pressure, and means for connecting each jack and its co-operating form to said mechanism and for disconnecting them therefrom whereby one jack and form can remain at rest while the other jack and form are in operation, substantially as described."

A useful feature of the machine is the means for maintaining the shoe and sole properly positioned on the jack during the leveling operation. It is important to do this, but it was a difficult problem because at different times every point of the sole is under pressure. The means disclosed in patent No. 997,798, July 11, 1911, Frasier, was a clamp arranged to engage the heel of the sole while the heel was not under pressure, and to let go of the sole momentarily as the form approached and engaged the heel end of the sole. This means is defined in all of the thirteen claims of this Frasier patent No. 997,798. A typical claim is the eighth:—

"8. A sole pressing machine, having, in combination, a shoe supporting jack, a sole pressing form, means for actuating the jack and form to subject the sole of a shoe supported upon the jack to a rolling pressure, a sole clamp mounted to move into and out of engagement with the sole of the shoe, and means for moving the clamp, substantially as described."

BEVELING MACHINE — MODEL B: HERCULES.

The commercial Hercules leveling machine as put out between 1903, when it was adopted, and 1905 had proved inconvenient for the operator because the pressing form was in his way while he was applying the shoe to the jack, or removing a shoe from it. The machine was accordingly reorganized to overcome this difficulty and the new machine was first supplied to manufacturers in June, 1905, the reorganized machine being known as "Leveling Machine, Model B, Hercules". The average output of the new machine is from 1400 to 1600 pairs of shoes a day as compared with an average of 1200 to 1400 pairs per day on the earlier model. This model B machine, which is the present standard commercial machine, embodies all the mechanisms set forth in the patents which have been discussed in connection with the earlier model, which, since the adoption of the model B machine, has been known as "Model A". But the reorganized machine also incorporates in its present commercial form a number of improvements which have been made since it was adopted.

The first of these improvements is an improved form of heel-engaging mechanism, for properly locating the work on the form, as has been explained. This improvement was adopted in May, 1907, and is shown in the drawings and defined in the claims of patent No. 944,620, December 28, 1909, Holt, of which a typical claim is the second: —

"2. A sole pressing machine, having, in combination, a pivotally mounted last carrier, including a last post, a form carrier co-operating therewith to subject the sole of a shoe to a rolling pressure, a heel clamp mounted on the last post, and means acting automatically to move the clamp into and out of engagement with the shoe."

The heel clamp of this Holt patent which has been used in the commercial machine since its adoption in 1907 is also defined in broader terms in the ten claims of Frasier patent No. 997,798, of which claim 8 has already been quoted.

In 1912 the model B Hercules machine was further improved by the incorporation in it of improved means for adjusting the jack

and locking it in adjusted position to vary the amount of pressure exerted by the machine in accordance with the thickness of the sole. This improvement is defined in the first claim of patent No. 982,267, January 24, 1911, Gouldbourn.

Since the machine was first adopted in April, 1903, 729 Hercules leveling machines have been put out by the United Company up to March 1, 1913. As I have already stated, the average day's work on the present model of the machine is from 1400 to 1600 pairs per day, and as has also been explained this machine is adapted for leveling heavy shoes such as men's McKay sewed and nailed shoes. It is particularly useful on heavy shoes because in this type of machine in which the pressure is exerted progressively only a narrow portion of the sole extending transversely across the sole is under pressure at one time and the amount of pressure required for heavy shoes can be safely exerted in this manner without danger of breaking the iron form or last upon which the shoe is mounted.

LEVELING MACHINE: ATLAS.

"Leveling Machine, Atlas", is of the type known as the "direct pressure type". This type of machine is provided with a form of jack which supports the shoe, and with a co-operating pressing form which engages the sole of the shoe, pressure being exerted through these two forms in a right line and being applied directly to the whole surface of the sole at once.

A distinguishing characteristic of the Atlas leveling machine is that it was the first leveling machine in the industry which was organized to adjust the machine automatically to various thicknesses of work, and then exert uniform pressure upon the sole of the shoe, irrespective of its thickness. Hence this machine is particularly adapted to operate upon lighter weight McKay sewed shoes such as could not withstand the relatively harsher action of the Hercules leveling machine, which would frequently distort the soles of lighter weight shoes. This characteristic of the Atlas machine is defined in the first claim of patent No. 557,744, April 7, 1896, Winkley, which is as follows:—

"1. In a sole laying machine the combination of a pressing form and shoe supporting jack, mechanism for relatively actuating the form and jack to secure pressure upon the sole of a shoe placed upon the jack, and means for automatically seating the form, in operative connection with said pressure mechanism, and acting to adjust the said pressure mechanism for shoes of different heights, substantially as described."

This characteristic principle of operation of the Atlas machine is further set forth in patent No. 627,034, June 13, 1899, Winkley, of which claim 1 is as follows: —

"1. In a sole pressing machine, the combination with a jack and form, of independent mechanisms operating automatically and successively to seat the form and to bring the form and jack into a position of pressure, substantially as described."

The machine of patent No. 627,034 was only an experimental machine, and was not put into commercial use. An important step in the development of that experimental machine toward a commercial machine is represented in patent 818,503, April 24, 1906, Winkley, and is defined in several claims of that patent, of which the third is typical: —

"3. A sole pressing machine, having, in combination, a plurality of shoe supporting jacks, a plurality of pressing forms, cooperating respectively therewith, mechanism for relatively actuating the jacks and forms to cause each jack and its cooperating form to press the sole of a shoe placed on the jack, comprising means for imparting relative vertical movements to each jack and form to produce pressure and clearance, means controlled by the operator for connecting each jack with said actuating mechanism, and automatic means for disconnecting each jack therefrom, substantially as described."

The first commercial Atlas leveling machine was constructed substantially as shown in the drawings and described in the nineteen claims of patent No. 818,504, April 24, 1906, Winkley. The more important improvements set forth in the claims of this patent are well described in the first two claims, which are as follows: —

"1. A sole pressing machine, having, in combination, a shoe supporting jack, a sole pressing form, mechanism acting automatically to bring the jack and form into a position of pressure to hold the jack and form in such position and thereafter separate the jack and form, and means for varying the time during which the jack

and form are held in a position of pressure, substantially as described.

"2. A sole pressing machine, having, in combination, a shoe supporting jack, a sole pressing form, mechanism for relatively actuating the jack and form to press the sole of a shoe, means acting automatically to stop said mechanism with a jack and form in a position of pressure, and means acting automatically to thereafter start said mechanism into operation, substantially as described."

The machine organized as set forth in the claims above quoted was the first leveling machine in the art to provide for holding the shoe under pressure for a predetermined time, and was also the first machine in the industry in which there was provision for varying this predetermined time. While the machine shown in this Winkley patent No. 818,504 was used commercially for some two years, it was not entirely satisfactory through lack of certainty in its operation and on account of excessive breakage of parts. The machine was therefore reorganized in successive stages which are represented in patent No. 845,714, February 26, 1907, Mayo, and set forth in eleven claims of that patent, and in patent No. 881,478, March 10, 1908, Mayo, which shows the commercial Atlas leveling machine as now put out. A typical claim of patent No. 845,714 is the first: —

"1. A sole pressing machine, having, in combination a plurality of shoe supporting jacks, a plurality of cooperating sole pressing forms, mechanism for relatively actuating each jack and its cooperating form to press the sole of a shoe, connecting devices for operatively connecting the jacks and forms to said mechanism, and means controlled by the operator for positively actuating said devices to operatively connect each jack and its cooperating form to said mechanism."

The present commercial Atlas leveling machine embodies the mechanisms set forth in the claims of the following patents: —

No. 627,034, June 13, 1899, Winkley.
No. 818,503, April 24, 1906, Winkley.
No. 818,504, April 24, 1906, Winkley.
No. 845,714, February 26, 1907, Mayo.
No. 881,478, March 10, 1908, Mayo.
No. 930,823, August 10, 1909, Winkley.

Over 600 Atlas leveling machines have been put out by the United Company. The machine has an average capacity of from 1000 to 1200 pairs of shoes per day.

Both leveling machine, Hercules, and leveling machine, Atlas, are put out by the United Company through its general department.

Mr. WEBSTER. Counsel for petitioner objects to all statements made by the witness in the foregoing answer relating to mechanisms not shown in patents issued prior to the filing of the petition herein, and to all statements made by the witness in reference to matters which have not been presented by the petitioner before the examiner, on the ground that the same is incompetent, inadmissible and immaterial and in no sense in reply to or in defence of matters presented before the examiner by the petitioner.

Int. 107. Have you collected in a single volume the patents relating to the Goodyear turn leveler, Hercules leveler and the Atlas leveler referred to in your preceding answer? If so, will you produce that volume?

Ans. I produce a volume comprising all of the patents referred to in my testimony regarding the three machines named.

Mr. PHILLIPS. I offer in evidence this volume of patents relating to Hercules, Atlas and Goodyear turn leveling machines.

[*One volume of patents relating to Hercules, Atlas and Goodyear turn leveling machines marked "Defendants' Exhibit 188".*]

Int. 108. Will you please name the number, the date and the patentee of the several patents contained in the volume just offered in evidence and marked "Defendants' Exhibit 188"?

Ans. No. 557,744, April 7, 1896, Winkley.
No. 563,487, July 7, 1896, Howe.
No. 627,034, June 13, 1899, Winkley.
No. 818,503, April 24, 1906, Winkley.
No. 818,504, April 24, 1906, Winkley.
No. 845,714, February 26, 1907, Mayo.
No. 861,746, July 30, 1907, Mayo.
No. 881,478, March 10, 1908, Mayo.
No. 884,144, April 7, 1908, Frasier.

No. 916,021, March 23, 1909, Rigby.
No. 925,509, June 22, 1909, Rigby.
No. 930,823, August 10, 1909, Winkley.
No. 932,220, August 24, 1909, Winkley.
No. 944,620, December 28, 1909, Holt.
No. 982,267, January 24, 1911, Gouldbourn.
No. 996,707, July 4, 1911, Eppler.
No. 997,798, July 11, 1911, Frasier.
No. 1,004,155, September 26, 1911, Eppler.

Int. 109. In the list of machines produced by you and read into the record in a prior portion of your testimony, you refer to clicking machine, model C, Ideal, as being first put out in March, 1908, by the United Shoe Machinery Company through its general department. What is the function of a clicking machine in the process of the manufacture of shoes? How was this work performed prior to 1899 and what advancement has been made by the United Shoe Machinery Company in this art since that date? If such advancements are disclosed in Letters Patent of the United States of the United Company, state the patents.

Mr. WEBSTER. Question objected to by counsel for the petitioner on the ground that it calls for testimony in reference to matters to which no reference has been made in the evidence heretofore submitted by the petitioner, and because it calls for matters that are in no wise in reply to or in defence of any matters presented by the petitioner before the examiner.

CLICKING MACHINE — MODEL C: IDEAL.

Ans. The clicking machine supplied to manufacturers by the United Shoe Machinery Company was designed, and is adapted, for use in the shaping of the parts of uppers of boots and shoes.

In 1899, and prior to that time, nearly all of the shaping of parts of uppers was done by a hand operation. The workman placed a skin of leather on a cutting table, located a pattern upon the skin and cut out the upper blank by running a knife around the edge of the pattern. I produce a number of patterns such as were used in that hand operation.

[*Four patterns used in hand cutting of uppers are introduced in evidence, and marked "Defendants' Exhibit 189".*]

[*Answer to Int. 109 continued:*]

To a very small extent the parts of uppers of coarse, heavy shoes were dyed out by means of handled dies. Such dies were placed upon the skin by the workman and forced through the stock by striking the die with a mallet. To a very limited extent also uppers of coarse, heavy shoes, such as brogans, were died out on sole-cutting machines. Neither of these dieing out methods, however, was suited for the shaping of parts of uppers for the medium or better grades of shoes, and before 1908 the parts of uppers of nearly all shoes were shaped, as first explained, by cutting around the pattern with a hand knife.

The United Shoe Machinery Company developed a machine for shaping parts of uppers which was first put out for commercial use in the United States in March, 1908, and is officially named "Clicking Machine, Model C, Ideal". This machine was the first commercially successful machine ever produced for this work. It seems strange that this important and expensive step in the manufacture of shoes had remained a hand operation until so late a date. The explanation probably is that the character of the work is unique, depending largely for its success upon the eye, skill and judgment of the operator. The skins from which upper blanks are cut vary largely in quality in different parts of the skin. The best portions must be utilized for the vamps, that is, the portion of the upper which extends upwardly from the sole and around the ball of the shoe, because that portion of the upper is the most conspicuous in the finished shoe and is subjected to the most wear. The next best portion of the stock must be used for quarters, that is, the parts above the vamp in which the eyelets, lacing hooks or buttons are set. Smaller parts of the best portions of the stock must be utilized for toe tips, and the other parts left after the cutting out of the vamps, uppers and tips must be utilized to the best advantage for other small and less conspicuous parts of the upper. The success of this hand operation depends entirely upon the workman's skill and judgment in selecting the portions of the skin

to be cut for the respective parts of the upper, and in so cutting the parts as to utilize the stock to the best advantage, avoiding any unnecessary waste. Probably the controlling reason why a machine for doing this work was never produced before 1908 was that it is impossible to dispense with this skill and judgment of the workman. Prior to the invention of the United Company's machine no one had been able to produce a machine by which the operation could be so performed as to utilize to the same extent as in hand work the skill and judgment of the operator, and at the same time enable the workman to do a sufficiently increased amount of work to justify the use of the machine. The solution of the problem by the United Company was to provide a machine organized to perform the purely mechanical work done by the hand workman, while at the same time affording full opportunity for the exercise of the requisite skill and judgment. The machine as first constructed is shown in patent No. 921,503, May 11, 1909, Bates. This machine was provided with a die block for supporting a skin to be operated upon, with which were used shallow, open dies with cutting edges shaped to the contours of the blanks which were to be cut. I produce a number of these dies of different shapes.

[*Four dies used on clicking machines are introduced in evidence, and marked "Defendants' Exhibit 190".*]

[*Answer to Int. 109 continued:*]

In the operation of the machine each die was in turn located upon the skin by the operator just as he had been accustomed to locate the upper pattern, with the advantage that as the die was shallow and open he could see the skin inside the die which was to constitute the blank, and which he could not see when the pattern was on the stock in the hand operation. The die was forced through the stock by a pressure arm which was mounted on a column behind the die bed and arranged to be swung to one side entirely out of the way of the operator so that he could inspect the stock as fully and conveniently as he had been accustomed to do in the hand operation, and after he had located the die properly he moved the arm over the die bed and operated the machine to force the die through the stock. This pressure arm was provided with a handle

to facilitate its swinging by the operator, and that handle was connected with a light tripping device for actuating the mechanism for operating the pressure arm so that the operator could, by merely depressing lightly the handle by which he had swung the pressure arm over the die, effect the operation of the pressure arm and then swing it out of the way, exposing the skin again for convenient inspection of the stock and another positioning of the die. The reciprocation of the pressure arm took place in one-sixth of a second, and the machine was so organized as to prevent a second reciprocation of the pressure arm, with the attending danger of injuring the operator, the blank or the skin. The organization by which these and other advantages are secured in the commercial machine is set forth in all of the seventy-three claims of patent No. 921,503, May 11, 1909, Bates. Typical claims are the following:—

"2. In a machine for dieing out thin sheet material such as upper leather for boots or shoes, the combination with a bed, of a presser member movable laterally with respect to said bed, means for reciprocating said presser member toward and away from said bed and a starting device movable laterally with said presser member."

"10. In a machine for dieing out thin sheet material such as upper leather for boots or shoes, the combination with a bed, of a free movable die, a presser member laterally movable into different operative positions over such bed, automatic mechanism for moving said presser member toward said bed into a position at a predetermined distance from said bed, means for adjusting the machine to vary the predetermined distance, and a light, quick acting device for rendering said mechanism operative at any point in the lateral movement of the presser member."

"22. In a machine for dieing out thin sheet material such as upper leather for boots or shoes, the combination with a cutting bed, of a free movable die, a presser member movable into a position over the die wherever located on the bed, and automatic mechanism for moving the presser member toward the bed to force the die through stock supported on the bed, both of said operations being controlled by the hand of the operator."

"66. A machine for dieing out thin sheet material, such as upper leather for boots or shoes, comprising a cutting bed, a free die movable over said bed, a presser member movable from a position at one side of the die into a position over the die, mechanism for moving the presser member toward the bed to force the die through

stock supported on the bed, and then moving the presser member away from the bed, a device for rendering said mechanism operative, and means whereby the presser member is positively restricted to a single reciprocation for each actuation of said device, and is automatically stopped in raised position at the end of every reciprocation."

The machine as first put out, and as always since constructed, was also provided with means for holding and protecting the surplus stock, that is, the portions of the skin remote from the part being cut, from being soiled by oil through contact with parts of the machine, as set forth in the nine claims of patent No. 950,986, March 1, 1910, Bates, of which a typical claim is the following: —

"3. In a machine of the class described, the combination of a bed, a presser-applying member movable laterally into and out of position over said bed, a support for said member located at one side of the bed, said parts being arranged to provide a recess between the support and the bed, and a trough in said recess, interposed between the bed and operating parts of the machine, to receive surplus stock and hold it out of contact with parts of the machine."

The starting mechanism of this machine is described in all of the thirteen claims of patent No. 1,011,903, December 19, 1911, Bates (application filed July 11, 1908).

In August, 1909, the convenience of the operator in using the machine was increased by providing a convenient receptacle for the scraps of leather which are constantly being produced in the operation of the machine, and which are preserved and sold by the manufacturer. This waste guide is arranged in front of the machine, and is so organized that the receptacle closes up out of the way of the operator as he leans over the die bed to inspect the skin and to locate the die, and automatically opens when the operator stands erect to operate the machine or to brush the scrap leather off the die bed. This organization is set forth in many claims of patent No. 946,619, January 18, 1910, Sherman, of which typical claims are the 10th and 12th: —

"10. The combination with a work support of a normally open waste guide constructed and arranged to be moved to closed posi-

tion and to return automatically to open position when the closing pressure is removed."

"12. The combination with a work support, of a yieldingly-mounted waste guide, arranged to be moved to closed position as the body of the operator comes in contact therewith in approaching said support, and to automatically move to open position as the operator moves away from said support."

In the operation of the commercial machine as it was first used, rapid operators would sometimes start the mechanism for depressing the pressure arm so that the arm would go down before its lateral swinging positioning movement was completed, thus striking an oblique blow, which sometimes injured the stock, the die, or the cutting block, and occasionally all of them. To remedy this the United Company's inventors developed a mechanism for stopping the lateral swinging movement of the pressure arm before it engaged the die in its downward movement. A further improvement which added to the convenience of the workman in operating the machine, and which was adopted at the same time, comprised means for automatically swinging the pressure arm to one side after the die had operated, relieving the operator of the necessity of swinging the arm laterally with his hand. A reorganized machine incorporating these two improvements was commercially adopted in the latter part of 1909, and is the present commercial machine. Three different inventors had a part in the development of this new organization. Successive steps in the experimental work resulting in the new machine, and different features of its organization, are represented in the claims of four patents, from which I will quote typical claims.

Twenty-three claims of patent No. 968,117, August 23, 1910, Buckminster, set forth this organization in broad terms: —

"7. A machine of the class described, comprising a bed, a die freely movable over said bed, a pressure applying member having a pressure surface area less than that of the bed and movable into operative position over the die wherever located on the bed, means for moving said member toward and away from the bed to cause it to engage the die and effect a pressing operation, and automatic means for preventing movement of the pressure applying member over the bed at the time it engages the die in the pressing operation."

Claim 4 of patent No. 1,006,453, October 24, 1911, Ashworth, is as follows:—

"4. In a machine of the class described, the combination with a bed, a die movable over said bed, and a pressure applying member movable over said bed into operative position above said die, of means for actuating said pressure member to apply pressure to said die, and means for automatically moving said member out of its operative position over said die after such actuation."

A typical claim of patent No. 1,010,476, December 5, 1911, Buckminster, is as follows:—

"52. In a machine for dieing out leather for boots and shoes, the combination of a cutting bed, a presser member freely movable laterally over said bed into operative position, and means acting to automatically move the presser member laterally into inoperative position."

The new organization is defined in all of the thirty-seven claims of patent No. 1,004,757, October 3, 1911, Eaton, which shows in its drawings the organization of the present commercial machine. A typical claim of this patent is the fourteenth:—

"14. A machine of the class described having in combination, a bed, a presser member manually movable over the bed into operative positions over different parts of the bed and movable toward and away from the bed to effect a pressing operation, and means for utilizing the momentum of the presser member acquired in its manual movement into operative position to effect its movement out of operative position after the pressing operation."

During the year 1911 there were adopted improvements in the machine for facilitating the cutting simultaneously of many thicknesses of cloth lining material from a roll supported outside of the die bed, on which improvements has been granted patent No. 1,070,133, August 12, 1913, Howe (application filed April 3, 1912), of which a typical claim is the first:—

"1. In a machine of the class described, the combination with a bed for supporting material to be cut and a presser member movable into engagement with a die supported upon said material, of means for clamping during the cutting operation a portion of said material that projects beyond the edge of the bed."

The use of the Ideal clicking machine effects a distinct improvement in quality and a striking economy over hand work in the cutting of uppers. In Brockton, where cutters are paid by the day, an operator using a machine dies out on an average over 80 per cent more blanks than he formerly shaped by hand. Cutters are paid $3.50 a day in the Brockton district for operating a machine as compared with $3.25 for hand work, but notwithstanding this increased cost of labor the average saving to the Brockton manufacturer by the use of the clicking machines is over two cents per pair. Use of the machine also effects an additional saving in stock of from 2 to 5 per cent as compared with hand cutting, since all waste caused by deviation from the pattern or by cutting beyond a corner of the pattern by the hand knife is obviated. The amount of the saving in stock, of course, varies with the quality of the stock and on high-grade leather is considerable, frequently amounting to more than the saving in labor.

The demand of shoe manufacturers for the Ideal clicking machine has exceeded the demand for any other new machine which has ever been produced by the United Company. At one time the company was 440 machines behind in filling its orders, and during the last six months of 1908 the company was all the time more than 400 machines behind in its orders. For several years the capacity of the factory was taxed in the building of these machines. During the last six months of 1909 over forty machines were shipped each week. At this date, over 6000 of the machines have been put into shoe factories in the United States. The machine is put out by the United Company through its general department.

The problem of providing dies for the clicking machine was one which had to be met by the United Company at the outset. Prior to the introduction of the clicking machine all dies used in the shoe industry, particularly for cutting sole leather, were made by skilled die makers. Within a short time after the clicking machine was first put into use the demand for dies became so great that it could not have been supplied by these skilled die makers if all in the country had spent their time exclusively in the making of dies for the clicking machine. For this reason, and because it

was important that the dies should be furnished to shoe manufacturers at a price much less than would be necessary if the dies were made by high-priced skilled die makers, the United Company developed an entirely new method by which unskilled labor could be employed for manufacturing clicking dies, and all dies which have been supplied by the United Company for use on the clicking machine have been manufactured in accordance with this method. Successive steps in the development of this method are represented by the following patents:—

No. 922,926, May 25, 1909, Lynch.

No. 1,029,877, June 18, 1912, Lynch (application filed April 23, 1909).

No. 1,030,641, June 25, 1912, Braden (original application filed December 9, 1909).

No. 1,030,781, June 25, 1912, Hollander (application filed March 16, 1910).

Of the twenty-two claims of patent No. 922,926, Lynch, all of which describe steps performed in the making of the dies, claim 4 is typical:—

"4. That improvement in the art of making dies which consists in bending to the outline of the desired pattern to be cut by said die material somewhat longer than said outline and butt welding together the ends of said material and at the same time forcing said ends together to reduce the blank or die thus formed to the size of the pattern, and maintaining the cutting edges on the ends in alignment during the butt welding operation."

The first dies made by the company gave trouble, owing to the unequal hardening of the cutting edge, so that the commercial method was improved in November, 1908, by including the method of patent No. 1,029,877, June 18, 1912, Lynch, granted on an application filed April 23, 1909. All of the ten claims of this patent describe steps now practiced in the making of the dies. Claim 1 is typical:—

"1. That improvement in the art of hardening and tempering tools which consists in simultaneously heating different parts of the tool in different contiguous heat conducting mediums so arranged and of such relative conductivity that the part of the tool

to be hardened is heated to the desired hardening temperature and that the adjacent part is heated detrimentally from the part to be hardened, and then entirely removing said tool from the heat conducting mediums and immersing it forthwith in a hardening bath."

Further improvements in the method and apparatus for performing it were described in the claims of patent No. 1,030,641, June 25, 1912, Braden (granted on an application originally filed December 9, 1909), and in the claims of patent No. 1,030,781, June 25, 1912, Hollander (granted on an application filed March 16, 1910), and it is anticipated that further patent protection will ultimately be obtained upon steps which are practiced in the making of the dies. Since the first clicking machine was put out for commereial use in March, 1908, and up to September, 24, 1913, the United Company has manufactured and supplied 783,465 clicking dies, all made in accordance with this method.

Like the Ideal clicking machine, dies for that machine are supplied to manufacturers by the United Company through its general department.

Mr. WEBSTER. The answer is objected to for that it contains statements in reference to mechanisms, methods and apparatus not shown and claimed in patents issued prior to the filing of the petition herein. And the same is further objected to for the reason that it is not in any sense in reply to, or in defence of, evidence submitted by the petitioner before the examiner.

Int. 110. Have you collected under one cover the several patents referred to by you in your answer to the last question relating to clicking machines; if so, will you please produce that volume?

Mr. WEBSTER. The introduction of patents issued after the date of the filing of the petition herein is objected to as incompetent, inadmissible and immaterial.

Ans. I produce a volume comprising copies of the patents mentioned in the foregoing answer relating to clicking machines and clicking machine dies.

[*Volume of copies of patents relating to clicking machine and clicking machine dies is introduced in evidence, and marked "Defendants' Exhibit 191".*]

Int. 111. Will you give the number, date and name of patentee of the several patents contained in the volume which has just been offered in evidence as Defendants' Exhibit 191?

Ans. No. 921,503, May 11, 1909, Bates (continuation of application filed October 8, 1906).

No. 922,926, May 25, 1909, Lynch.

No. 946,619, January 18, 1910, Sherman.

Int. 112. In the list of machines produced and read into the record by you as a part of your prior testimony, you refer to the lacing machine, Ensign, models A and B, as put out February, 1906, by the United Company through its fitting room department. Please state what is the function of this machine in the process of making shoes. If this Ensign lacing machine as put out in February, 1906, by the United Company embodied any mechanisms or devices which form the subjects-matter of Letters Patent of the United Company, state the patent and the importance of such mechanism or devices.

Mr. WEBSTER. The question is objected to for that it calls for matters in no sense in reply to, or in defence of, evidence or matters submitted by the petitioner either before the examiner or elsewhere.

Ans. In the process of manufacturing a laced shoe it is necessary for good shoe making that the shoe be laced before it is lasted, since owing to the tension exerted upon the upper all around the shoe, including the ball, during the lasting operation the exposed eyeletted edges of the upper would be pulled apart and the shoe would be distorted unless in some way these eyeletted edges were held the proper distances apart during the lasting operation. This danger will be immediately noted upon examining some of the defendants' exhibits, for example, Defendants' Exhibit 8. Unless the eyeletted edges of the shoe of Defendants' Exhibit 8 had been secured against relative displacement during the lasting operation, it would have been practically impossible to have maintained the proper relation of the opposed eyeletted edges during the lasting operation.

LACING MACHINE — MODEL A: ENSIGN.

In most shoe factories, it is the practice preliminary to lasting to lace a number of eyelets with twine, which is tied to insure the proper relative positions of the opposed eyeletted edges during the lasting operation. This lacing was done in 1899 by girls, who passed twine through the eyelets much as a shoe lacing is inserted through the eyelets of a shoe, and who tied the ends of the twine after passing it through the eyelets. Until 1906 this operation was always performed by hand. Since that date the operation has been performed automatically upon a machine known as "Lacing Machine, Ensign", which laces the twine through the eyelets, severs the twine from the source of supply, and ties the ends.

The operation of this Ensign lacing machine is illustrated in Defendants' Exhibits 7, 149, 178 and 182.

Excepting one or two experimental lacing machines put out by the Smith Lacing Machine Company, the first lacing machine ever commercially used in the manufacture of shoes was put out by the United Shoe Machinery Company in February, 1906.

As it is now being supplied to manufacturers, the Ensign lacing machine embodies the mechanisms set forth in the claims of the following patents: —

Reissue No. 12,638, April 23, 1907, Smith (original patent No. 779,008, January 3, 1905).

No. 855,969, June 4, 1907, Paine and Winkley.

No. 946,789, January 18, 1910, Smith.

No. 962,105, June 21, 1910, Smith.

No. 1,030,547, June 25, 1912, Smith (application filed March 31, 1908).

No. 1,030,559, June 25, 1912, Alexander (application filed September 7, 1909).

No. 1,030,573, June 25, 1912, Enslin (application filed January 30, 1908).

No. 1,030,619, June 25, 1912, Smith (application filed January 16, 1906).

No. 1,030,753, June 25, 1912, Smith (application filed September 8, 1908).

The first commercial lacing machine, now known as model A, was constructed substantially as shown in patent No. 962,105. That machine was put out until the latter part of 1908. In the latter part of 1907 and in the early part of 1908, the model A machine was redesigned to incorporate improvements in nearly all of the mechanisms of the machine, which improvements had been developed since the model A machine was first put out. That redesigned and improved machine, known as "Lacing Machine, Model B, Ensign", has been the standard commercial machine supplied by the company since 1908. As first put out it was constructed substantially as shown in the drawings of patent No. 1,030,573, June 25, 1912, Enslin (application filed January 30, 1908), except for some improvements which were incorporated in the machine during its reorganization, and which were made after the filing date of the application for the Enslin patent.

The development of the lacing machine into commercial form and the steps in that development are represented by the following patents: —

No. 855,969, June 4, 1907, Paine and Winkley.

Reissue No. 12,638, April 23, 1907, Smith (original patent No. 779,008, January 3, 1905).

No. 962,105, June 21, 1910, Smith.

Discussing first the successive stages of the development of the machine as indicated by these patents, the fundamental requisites for a machine for lacing uppers are that the thread be passed through the eyelets and that for this operation the eyelets be properly located; that sufficient slack be produced in the thread to allow the opposite edges of the lacing slit to assume and maintain their proper relations during the lasting operation, and that the ends of the lacing be secured to make the lacing effective.

Elements fulfilling these fundamental requisites of a lacing machine are defined in the claims of patent No. 855,969, June 4, 1907, Paine and Winkley. Eleven claims of this patent define broadly the organization of the commercial machine in all stages of its development. Typical claims of this Paine and Winkley patent are the following: —

"35. A shoe lacing machine having, in combination, means for passing a continuous thread through the eyelet holes of an upper to form a lacing and for securing the ends thereof, and means for producing a predetermined amount of slack in said lacing to permit the edges of the lacing slit to be positioned properly on the last."

"38. A shoe lacing machine, having, in combination, a thread supply, means for holding the free end of the thread, and means for passing a continuous thread from said supply through the eyelet holes of an upper to form a lacing and for securing the ends thereof."

"45. A shoe lacing machine, having, in combination, means for passing a continuous thread through the eyelet holes of an upper to form a lacing, and means passing through aligned eyelet holes in opposite sides of the upper to locate the eyelet holes in position to receive the lacing."

The machine of this Paine and Winkley patent was only experimental, and was never used commercially. That experimental machine had but a single needle.

The next important step in the development of a commercial lacing machine was a machine organized with a plurality of needles which could lace at one operation a plurality of eyelets. This step in the art is represented by reissued patent No. 12,638, reissued April 23, 1907, Smith. All of the twenty-five claims of this pat-

ent describe mechanisms embodied in the commercial machine. A typical claim is the twenty-fifth : —

"25. In a machine of the character described, means comprising a plurality of needles for engaging and locating a plurality of pairs of eyelets of a shoe upper, and forming therein a series of connected loops, and means for completing the lacing and for securing the ends of the lacing to prevent withdrawal."

The first commercial successful machine is shown and described in the patent No. 962,105, June 21, 1910, Smith. The most important of the improvements illustrated in the drawings and set forth in the claims of this patent were the means for effecting simultaneous adjustment of the needles for spacing them in accordance with the spacing of the eyelets, that is, the distance apart of the eyelet in the upper on the same side of the lacing slit, and means for quickly adjusting the organization of the machine so that as the result of its operation the opposed eyeleted edges of different styles of uppers would be located at the desired distances apart. The organizations by which these and other advantages were secured are defined in nearly all of the forty claims of this patent No. 962,-105, and nearly all of those claims set forth mechanisms which are now embodied in the standard commercial machine. Typical claims setting forth the improvements to which I have specifically referred and which are embodied in both models of the Ensign lacing machine are 7 and 13 : —

"7. A machine for lacing shoe uppers, having, in combination, a plurality of needles arranged to pass a series of loops of lacing cord through the eyelet holes of an upper, and means for simultaneously adjusting said needles to space the needles in accordance with the spacing of the eyelet holes in the upper to be laced."

"13. A machine for lacing shoe uppers, having, in combination, means including a plurality of needles for forming loops in a lacing cord and for passing said loops through the eyelet holes of an upper and means for simultaneously adjusting the length of a plurality of said loops to vary the amount of slack in the completed lacing."

LACING MACHINE — MODEL B : ENSIGN.

The machine shown in this Smith patent No. 962,105 was the commercial machine for some two years. That machine has been

known as the "Model A Machine" since it was reorganized in 1908 to incorporate improvements in nearly all of its mechanisms which had been made during the two years of its commercial use. It should be understood, however, that the reorganized machine, now known as the "Model B Machine", embodied the organization broadly defined in the claims which have been quoted in reviewing the development of the machine.

The more important improvements embodied in the redesigned or model B machine are set forth in the claims of patent No. 1,030,547, June 25, 1912, Smith (application filed March 31, 1908), and patent No. 1,030,573, June 25, 1912, Enslin (application filed January 30, 1908).

Referring only to the two more important improvements over the model A machine which have been incorporated in the model B machine, the first of these had to do with providing an extra amount of slack in the lacing cord. It had been found in the commercial use of model A machines that on certain kinds of work a greater amount of slack in the lacing cord or thread is needed than is usually required; for example, in blucher shoes additional slack in the lacing cord is needed in order to permit the lower ends of the opposed eyeletted edges to assume their proper position on the last, and the relative positions which they should have in the finished shoe. The patent to Smith No. 1,030,547 defines in its claims means for securing such slack thread when required. The first claim of this patent is as follows: —

"1. A machine for lacing shoe uppers, having in combination, means for forming a series of loops of lacing cord, and thereafter inserting said series of loops in the eyelet holes of an upper, and additional means for varying the amount of slack in the completed lacing, substantially as described."

Twenty-nine of the claims of this Smith patent No. 1,030,547 set forth mechanisms embodied in the model B machine. While the mechanism set forth in this patent provided means for securing the requisite additional amount of slack in the lacing cord, it was found that the slack which was formed by that mechanism was not retained where it was needed, that is, at the lower end of the

lacing, and for the lower pair of opposed eyelets. Accordingly, the mechanism of the Smith patent was improved by organization of the slack thread mechanism so that it would not only properly form the desired additional slack in the thread, but would retain that slack where it was needed, that is, at the lower end of the lacing. This improvement is set forth in claim 23 of patent No. 1,030,573, June 25, 1912, Enslin (application filed January 30, 1908), which claim is as follows: —

"23. A machine for lacing shoe uppers, having, in combination, means for inserting a lacing cord in the eyelet hole of an upper, mechanism for tying the ends of the lacing together, and means acting on the lower portion of the lacing to provide slack therein, substantially as described."

The other more important improvement which was embodied in the model B machine is shown in this Enslin patent No. 1,030,573, and consisted in means for effecting the simultaneous adjustment of the loopers and the needles which co-operate in the machine in forming loops to be passed through the eyelet holes, thus adding to the convenience of the operator and insuring greater accuracy in the work by enabling these parts to be positioned for different spacing of the eyelets by one adjustment instead of two separate adjustments. A number of claims of the Enslin patent are directed to this improvement, and a typical claim is the second: —

"2. A machine for lacing shoe uppers, having, in combination, a plurality of needles, means co-operating therewith to form a series of loops in the lacing cord, and means for simultaneously adjusting said needles and co-operating means to space the same in accordance with the spacing of the eyelet holes in the upper to be laced, substantially as described."

A number of other improvements embodied in the model B machine are set forth in the claims of this patent No. 1,030,573, all of the fifty-nine claims of which define mechanisms embodied in the commercial model machine. Further improvements which were incorporated in the model B machine in 1909, and have been embodied in the commercial machine as put out since that time, are set forth in eight claims of patent No. 1,030,559, June 25, 1912, Alexander (application filed September 7, 1909). Other improve-

ments were incorporated in the machine in 1912, for which patent protection has not yet been obtained.

Comparing the machine with hand work, on the better grades of shoes where particular pains were taken to locate the opposed edges at the proper distance apart, the average day's work by the hand operator was 500 pairs. On the medium and cheaper grades of shoes, where less pains were taken and more or less careless work was done, the average number of pairs laced by hand would be 800. On the Ensign lacing machine the average number of uppers laced is from 1400 to 2500 pairs per day. In some districts 2500 pairs is the regular average day's work on this machine. It should further be noted that, whatever the quality of the shoe, the upper laced on the machine is always laced right, while accuracy could be secured in hand work only by constant and unusual care.

Fourteen hundred and fifteen Ensign lacing machines had been put out up to March 1, 1913, the end of the company's last fiscal year. An Ensign lacing machine will take care of as many shoes as from four to seven welt-sewing machines, and nearly all lace shoes now being made are laced on this machine.

The Ensign lacing machine is now put out by the United Company through its fitting room department, which department was organized just prior to January 1, 1913. Previously the machine was put out through the lasting department.

Mr. WEBSTER. The answer is objected to for that it relates to matters in reference to which no evidence has been presented by the petitioner, either before the examiner or elsewhere; and, further, because the answer refers to a large extent to patents issued after the date of the filing of the petition herein. The answer is further objected to because of the same being largely argumentative.

Int. 113. Have you collected in a single volume the patents referred to in your last answer as relating to Ensign lacing machines?

Ans. Yes, sir; and I produce a volume comprising all of the patents referred to by me in connection with the Ensign lacing machine.

[*Volume of patents relating to Ensign lacing machine is introduced in evidence, and marked "Defendants' Exhibit 192".*]

Mr. WEBSTER. The introduction of the patents as exhibits is objected to because they relate to matters not touched upon, and upon which no evidence has been submitted, by the petitioner, before the examiner or elsewhere, and, further, all patents issued after the date of the filing of the petition herein are especially objected to on the ground of the same being incompetent, immaterial and inadmissible.

Int. 114. Will you please give the number, date and name of patentee of the several patents contained in the volume which has just been offered in evidence as Defendants' Exhibit 192?

Ans. No. 779,008, January 3, 1905, Smith.

Reissue No. 12,638, April 23, 1907, Smith (original patent No. 779,008).

No. 855,969, June 4, 1907, Paine and Winkley.

No. 946,789, January 18, 1910, Smith.

No. 962,105, June 21, 1910, Smith.

No. 1,030,547, June 25, 1912, Smith (application filed March 31, 1908).

No. 1,030,559, June 25, 1912, Alexander (application filed September 7, 1909).

No. 1,030,573, June 25, 1912, Enslin (application filed January 30, 1908).

No. 1,030,619, June 25, 1912, Smith (application filed January 16, 1906).

No. 1,030,753, June 25, 1912, Smith (application filed September 8, 1908).

Int. 115. What is the function of the machine referred to as trimming machine, Goodyear insole heel seat, in the list of machines submitted by you in your prior testimony? How was the operation, performed by this machine, performed prior to 1899? What has been the development of this art since 1899? If the standard machine put out by the United Company for performing this operation embodies the subjects-matter of any Letters Patent of the United Company, state the patents.

Mr. WEBSTER. The question is objected to for that it calls for testimony with reference to matters not touched upon by the petitioner, and calls for matter which is not in reply to, or in defence of, any evidence submitted by the examiner.

TRIMMING MACHINE: GOODYEAR INSOLE HEEL SEAT.

Ans. After an insole has been channeled and been tacked to the bottom of the last it is usually necessary to trim the insole around its heel end to shape it accurately to the rear end of the last. While the insole is originally died out to correspond with the pattern of the bottom of the last, it frequently becomes distorted during the channeling operation and during the lip-turning operation, that is, the operation of raising the lip and turning it back upon the bottom of the insole. An insole upon which these operations have been performed is shown in Defendants' Exhibit No. 145. This distortion of the insole takes effect in lengthwise stretching and frequently results, after the insole has been tacked to the last with its forepart fitted to the forepart of the last, as illustrated in Defendants' Exhibit 149, in an excess of stock at the rear end of the insole. To insure a good lasting operation this excess of stock must be trimmed off and the heel end of the insole shaped accurately to the contour of the bottom face of the rear end of the last. This operation was always performed by hand prior to 1899, and in fact was a hand operation until January, 1911.

The United Shoe Machinery Company put out in January, 1911, the first machine ever commercially used for performing this operation of trimming off the excess stock at the rear end of the insole and shaping the rear end of the insole to fit the last accurately. Before this machine was developed many attempts had been made to devise a machine for performing this operation, and several of the United Company's inventors had endeavored to produce a machine for doing this work. One difficulty in performing this operation by machine was that all lasts are provided with iron plates on their bottoms at the rear end to turn over and clinch the nails used in attaching the heel end of the outsole to the shoe, and also the nails which are driven to attach the heel to the shoe.

This iron plate is illustrated in Defendants' Exhibit 145. The insole lies against this iron plate on the rear end of the last, and prior to January, 1911, no machine had been produced which could meet the problem of trimming the heel end of the insole to the contour of the last without ruining the cutter by running it against the iron plate on the bottom of the last.

A further problem which had to be met was that the insole stock is frequently rather soft and flexible, so that it tends to buckle or wrinkle during this trimming operation, and the moment that such buckling or trimming occurs, the accuracy of the cut is defeated.

The first of the problems referred to was met in the machine first put out by the United Company in January, 1911, by an organization comprising a rotary cutter, means for lifting the insole slightly away from the iron bottom of the last into the path of the rotary cutter and means for guiding the insole and the last relatively to the cutter by engagement with the edge of the last close to its tread face. This permitted accurate trimming of the insole to shape it to the contour of the last bottom without any danger of injuring the cutter by running it against the iron plate.

The second problem, that is, the problem of preventing the wrinkling or buckling of the insole in such a manner as to defeat the accuracy of the cut, was provided for in this organization by means for pressing the insole against the device which raised it off the last, thus clamping the insole closely adjacent to the point where the cutter operated. This means, so arranged as to exert pressure yieldingly upon the insole, and mounted for adjusting movement toward and away from the device which lifted the insole off the iron plate, provided the necessary support for the insole close to the point where the cutter was operating, and effectively prevented any buckling or wrinkling of the insole, and, further, enabled the organization to adapt itself to insoles of varying thicknesses. The organization further included means for presenting the insole for the operation of the cutter, which was arranged to afford support for the last, and at the same time to permit the trimming operation to proceed along the straighter side portions of the heel end of the last, as well as around the curved rear end.

This organization is defined in all of the seventeen claims of patent No. 1,076,431, October 21, 1913, Keyes (application filed October 3, 1910). Typical claims of this patent are as follows:—

"1. A machine for trimming to the contour of the heel end of a last the heel portion of an insole attached to the bottom of the last comprising, in combination, a cutter, and guiding means for relatively positioning the last and cutter including a device constructed to extend between the tread face of the last and the insole and of such length and thickness as to raise the insole from the last and permit it to be trimmed by the cutter without interference between said cutter and the edge of the last.

"2. A machine for trimming an insole attached to the bottom of a last comprising, in combination, a cutter, guiding means to engage the sides of the last, a device located adjacent to the cutter to extend between the bottom of the last and the insole, and means to support the insole sufficiently close to the point of operation of the cutter to hold it against any tendency to bend away from the cutter."

"17. A machine for trimming an insole attached to the bottom of a last comprising a driven cutter, guiding means positioned close to the cutter having a part designed to engage and guide the side surfaces of the last and another part arranged to project between the last bottom and the inner face of the insole, a device arranged to engage the outer face of said sole close to the point of operation of the cutter, and a support for the last constructed to permit movement of the last relatively to the cutter to enable the trimming operation to proceed along the sides of the heel as well as around the end of the heel."

The method practiced in the operation of this machine is defined in all of the eleven claims of patent No. 1,076,432, October 21, 1913, Keyes (original application filed October 3, 1910). Typical claims of this patent are as follows:—

"1. The method of trimming an insole attached to a last which consists in raising a portion of the insole away from the last, and trimming the raised portion of the insole to the edge contour of the tread face of the last."

"6. The method of trimming an insole attached to a last which consists in gripping successively different portions of the insole close to points opposite the margin of the tread face of the last and holding said portions away from the last, and trimming said portions of the insole while so held to the dimensions and the edge contour of the corresponding portions of the tread face of the last."

Further improvements were incorporated in this machine in 1912, for which it is expected that patent protection will eventually be obtained.

One hundred and thirty-three of these insole heel-seat trimming machines have been put out since its introduction in January, 1911. The machine will trim at least 3000 pairs of insoles per day, and at least one operator is trimming 5000 pairs a day on this machine, which will prepare the insoles for from twelve to twenty No. 5 lasting machines. The field for the machine is in the factories where the medium and better grades of welt shoes are made. This trimming machine, Goodyear insole heel seat, is put out by the United Company through its Goodyear department.

Mr. WEBSTER. The answer is objected to for that it relates to matters with reference to which no evidence has been submitted by the petitioner, and because the answer is not in reply to, or in defence of, any evidence submitted by the petitioner before the examiner, and because it relates to none of the issues involved in this cause, and for the reasons aforesaid the answer is inadmissible, irrelevant and incompetent.

Int. 116. Have you collected under a single cover the patents referred to in your last answer referring to insole heel-seat trimming machines?

Ans. Yes, and I now produce the same.

[*Patents relating to insole heel-seat trimming machines are introduced in evidence, and marked "Defendants' Exhibit 193".*]

Mr. WEBSTER. The introduction of the patents is objected to for the same reasons as the answer was objected to.

Int. 117. Will you please state the number, date, and name of patentee of the patents which form the exhibit offered in evidence as Defendants' Exhibit 193?

Ans. No. 1,076,431, October 21, 1913, Keyes (application filed October 3, 1910);

No. 1,076,432, October 21, 1913, Keyes (original application filed October 3, 1910).

Int. 118. In the list of machines heretofore submitted by you in a prior part of your testimony (question 7) you refer to the

jointing machine, Goodyear. What is the function of that machine in the operation of making shoes; how was the work done by that machine prior to 1899? If the United Company are putting out any machines for that purpose which embody mechanism forming the subjects-matter of any Letters Patent of the United Company, state the patents and describe the development of this art since 1899.

Mr. WEBSTER. The question is objected to for that it calls for matter in no sense in reply to, or in defence of, any matters introduced by the petitioner.

JOINTING MACHINE: GOODYEAR.

Ans. Preparatory to blacking or staining and finishing the edge of a shoe sole, the edge must be finally shaped and smoothed up, and this operation is universally performed by rotary cutters, it being the usual process to use two cutters, one formed to impart the desired shape to the edge of the forepart of the sole, and the other being formed to impart the desired shape to the edge of the shank portion of the sole. After this edge-trimming operation there is left, immediately in front of the breast of the heel, that is, the front face of the heel, a portion of the edge of the sole shank on each side, about one-half an inch long, which has not been shaped in the edge-trimming operation, owing to the inability of operating the rotating shank-trimming cutter any nearer to the breast of the heel, without danger of frequently mutilating the heel. This surplus stock must be removed prior to the edge-setting operation, that is, the finishing operation on the edge of the sole.

I produce a shoe in which, on the right-hand side of the shoe, is shown the condition of the edge of the shank of the sole in front of the heel breast after the edge-trimming operation, while on the left side of the shoe the bunch of the stock in front the heel breast has been removed. The step in the manufacture of shoes which comprises the removal of this surplus stock from the edge of the sole in the shank is known as "jointing". This operation was performed, on the inside of the shoe which I produce, by the

United Company's "Jointing Machine, Goodyear", which was first put into commercial use in November, 1910.

[*Shoe illustrating operation of jointing machine, Goodyear, is introduced in evidence, and marked "Defendants' Exhibit 194".*]

In February, 1899, and always before the introduction of the United Company's jointing machine, this operation was a hand operation and was performed by a hand knife. In this hand operation the operator would run the knife lengthwise of the edge of the shank to sever the surplus stock longitudinally of the sole edge and would then cut off the surplus stock at the heel breast by a cut cross-wise of the sole. The requirements for a satisfactory jointing operation were, first, that the longitudinal cut should be a continuation of the operation of the edge trimmer; that is, that the cut should be made in the same plane as the trimmed edge, and at the same angle to the bottom of the sole as the cut made by the edge trimmer. And, secondly, that the transverse cut should be made in the plane of the heel breast.

As to the first requirement the face of the edge which is left after the surplus stock is removed must be just like the edge left by the edge-trimming machine in front of this cut, because otherwise the edge-finishing iron used in the edge-setting operation would not fit at this point and the edge setting at this point would not be properly performed. Unless unusual pains were taken by the hand workman in jointing, these requirements for satisfactory work were not met so that a good edge-finishing operation would be performed.

Early in 1905 the United Company undertook to develop a machine for performing this operation, and after several years of experimenting and trying out of several experimental machines in shoe factories, a successful machine was finally produced and, as stated, was put into commercial use in November, 1910. Prior to that date a number of machines had been constructed as shown in patent No. 1,030,605, June 25, 1912, Perry (application filed February 9, 1910), and had been used in shoe factories, but that use was of an experimental nature and the machine was not regarded as a commercial success until it had been reorganized and con-

structed substantially as shown in patent No. 1,047,982, December 24, 1912, Perry (application filed April 29, 1911). The reorganized machine shown in the drawings and set forth in the claims of that patent No. 1,047,982 was adapted as a standard commercial machine in November, 1910.

The first problem which had to be solved in the production of this machine was the making of the longitudinal cut and the transverse cut in such manner that the paths of the cutting knives should intersect, to insure that the surplus stock should be severed completely from the shoe, and this had to be done in such manner that neither cut should extend beyond the point of intersection of the two cuts, as that would deface the shoe. Further, the longitudinal cut must, as already explained, be a continuation of the cut made in the edge-trimming operation; that is, it must be in the same plane as the plane of the trimmed edge of which it is a continuation. These requirements were met in the commercial machine by providing two reciprocating knives. The knife which formed the longitudinal cut in continuation of the work of the edge-trimming cutter has a contour which is the same as that of the shank cutter on the edge-trimming machine. The cut made by this knife is about a quarter of an inch long and the other knife which reciprocates in a plane parallel to the breast of the heel cuts to a line intersecting the cut made by the first knife at the end of that cut. In the operation of the machine the edge of the shank is presented for the action of the cutters at the point where the edge-trimming operation left off and the shoe is moved quickly to transfer the point of operation of the cutters to the plane of the heel breast, when the operation is completed. The second problem which had to be dealt with in developing this machine was the insuring of proper protection of other parts of the shoe, particularly the heel and the upper of the shoe, from injury by the cutters. This problem was met in the commercial machine without interfering at all with the operation of the cutters. The third problem which had to be met in the production of a machine for performing this hand operation was to produce a machine which manufacturers could afford to use in preference to the inexpensive hand operation. This

problem was met by the general organization of the machine providing for convenient and quick operation and by providing two sets of trimming mechanisms arranged close together, one set comprising cutters shaped and arranged to perform the operation on the right side of the shoe, and the other, cutters shaped and arranged to perform the operation on the left side of the shoe, so that practically all that the operator in changing from one side to the other had to do was to turn the shoe over.

In the commercial use of this machine it was found that it had a capacity of considerably over twice the number of shoes which could be operated upon by a hand workman. The organization by which the problems which I have discussed were solved is set forth in nearly all of the seventy-five claims of patent No. 1,030,605, June 25, 1912, Perry (application filed February 10, 1910), of which the following claims are typical: —

"1. In a machine of the class described the combination with means for trimming the edge of a shoe sole to the line of the heel breast, of additional means operating at the same presentation of the shoe to the machine to detach the trimmed material from the sole in a line with said heel breast.

"2. In a machine of the class described, the combination with means for trimming the edge of a shoe sole to the line of the heel breast, of means for positioning the shoe for the operation of said trimming means, and means for detaching the trimmed material from the sole edge in a line with said heel breast while the shoe is positioned by said positioning means."

"21. An edge trimming machine comprising a trimming knife having right and left edges, right and left chopping knives co-operating respectively with said right and left edges, said chopping knives each being arranged to move in a path transverse to that of its co-operating trimming edge and means for moving said trimming knife to cause its edges to move alternately to their respective lines of intersection with the paths of the chopping knives."

"60. In a trimming machine, the combination of a cutter arranged to trim that portion of the sole edge between the heel breast and the point in the shank at which the usual machine trimming operation is stopped, means for driving the cutter, and means for protecting the other parts of the shoe during the trimming operation from injury by said cutter, but permitting the cutter to trim to the heel breast."

The organization of the machine which enabled the operator to remove the knives from the machine, sharpen them, and return them to the machine without disturbing the adjustments of the knives, which were necessarily delicate for the reasons which I have explained in detail, is defined in all of the nineteen claims of patent No. 1,047,982, December 24, 1912, Perry, of which claim 6 is typical: —

"6. A machine of the class described comprising, in combination, a plurality of knives, connected holders for said knives, mechanism for driving said holders and means for retaining said holders in operative relationship to said driving mechanism constructed to permit the holders to be removed readily from the driving mechanism while retaining their connection with each other undisturbed."

In August, 1911, important improvements were incorporated in the machine. It had been found that occasionally a heel would be damaged in the operation of the machine if the operator were careless. The liability of such injury was obviated by the improvements defined in two of the claims of patent No. 1,048,196, December 24, 1912, Moody (application filed November 18, 1907). A typical claim is the fifth: —

"5. In a machine for cutting in shoe shanks, a knife for trimming along the edge of a shoe sole adjacent to the heel breast, a second knife for curring off the trimmed material substantially in line with the heel breast, means for operating said knives, and a stop positioned to engage the breast of the heel to limit the movement of the shoe relatively to said knives, said stop being adjustable relatively to said knives."

As has already been stated, the capacity of this machine was more than twice the number of shoes which could be jointed by the hand workman, and moreover the quality of the work done by it was always the same and perfect, while the hand workman could perform the operation perfectly only by the taking of unusual pains which would reduce the amount of work which he would do. One hundred and sixty-two machines were put out by the United Company between the time when the machine was introduced in November, 1910, and October 1, 1913. One machine will take care of three or four welters. The demand for this machine has, so far,

been exclusively for the manufacture of welt shoes. This machine is put out by the United Company through its Goodyear department.

Mr. WEBSTER. The answer is objected to in that it relates to matter wholly immaterial to the questions involved herein, and as having no reference to matters and in no sense in defence of matters introduced by the petitioner, and for the reasons aforesaid the answer is objected to as incompetent, immaterial and inadmissible.

Int. 119. Have you collected under separate cover several Letters Patent referred to by you in your answer to the last question relating to the jointing machine?

Ans. Yes, sir, and I produce the volume [*introducing volume of patents*].

[*Volume of patents relating to jointing machines marked "Defendants' Exhibit 195".*]

Mr. WEBSTER. The introduction of the patents offered in evidence is objected to for that they were all issued after the date of the filing of the petition herein, and are therefore incompetent, immaterial and inadmissible.

Int. 120. Will you state the number, the date and the name of the patentee in each of them?

Ans. No. 1,030,605, June 25, 1912, Perry (application filed February 10, 1910.

No. 1,047,982, December 24, 1912, Perry (application filed April 29, 1911).

No. 1,048,196, December 24, 1912, Moody (application filed November 18, 1907).

Int. 121. In the list of machines submitted by you in connection with your prior testimony you referred to several eyeletting machines. What is the function of the eyeletting machine in the process of manufacturing boots and shoes? Which of the eyeletting machines referred to by you is the standard machine for regular work? Describe the development of such standard machine since 1899. If it embodies mechanisms which form the subjects-matter of any Letters Patent to the United Company, name the patents.

Mr. WEBSTER. The question is objected to on the ground that it calls for matter not in any sense in reply to, or in defence of, any evidence offered by the petitioner, and is immaterial, irrelevant and inadmissible.

Ans. An eyeletting machine is used in the manufacture of shoes to set eyelets in the edges of the "quarters" of lace shoes, both men's and women's.

EYELETTING MACHINE: DUPLEX.

At the time of its organization in February, 1899, the United Company had no machine for setting eyelets. Since that time it has developed and supplied to shoe manufacturers several types of eyeletting machines of which the company's standard machine for regular work is the machine known as "Eyeletting Machine, Duplex", which is put out by the company through its eyeletting department. This machine was first put out for commercial use in July, 1902. The organization of the machine as now put out is described in the claims of the following patents: —

No. 636,175, October 31, 1899, Prime.

No. 672,056, April 16, 1901, Davey and Ladd.

No. 683,488, October 1, 1901, Pearson.

No. 926,903, July 6, 1909, Smith.

No. 934,066, September 14, 1909, Goddu.

No. 964,626, July 19, 1910, Dunphy.

No. 1,013,215, January 2, 1912, Pearson (application filed May 18, 1903).

No. 1,017,602, February 13, 1912, Smith (application filed June 28, 1910).

No. 1,023,275, April 16, 1912, Rogers (application filed December 1, 1911).

No. 1,030,833, June 25, 1912, Rumney (application filed August 8, 1906).

No. 1,048,840, December 31, 1912, Littlefield (application filed November 2, 1906).

No. 1,057,068, March 25, 1913, Like (application filed June 28, 1909).

The commercial machine is constructed substantially as shown in the drawings and described in the specifications and claims of Goddu patent No. 934,066, September 14, 1909, although the organization of the present commercial machine embodies improvements shown in the drawings of several of the later patents and set forth in their claims. It should also be noted that some of the features of the organization shown in the Goddu patent No. 934,066 are more broadly defined in the claims of patent No. 1,013,215, January 2, 1912, Pearson (application filed May 18, 1903).

This Duplex eyeletting machine was the first and only machine ever used for inserting eyelets in the upper simultaneously on both sides of the lacing slit. Eyeletting machines of the type previously in general use were organized to set one eyelet at a time, and were used, first, to set eyelets one at a time in the upper on one side of the lacing slit, and then to set the eyelets one at a time on the other side of the lacing slit. The Duplex eyeletting machine has a double advantage over that type of single machine in that the quality of its work is superior, since eyelets of each pair in the opposed edges are properly located opposite each other and the capacity of the machine is greater, being over 50 per cent more than that of the single machine.

Referring now to such of the patents as represent most marked steps in the development of the Duplex eyeletting machine, No. 636,175, October 31, 1899, Prime, is the first patent in the industry showing and describing a machine for inserting eyelets simultaneously in the two opposite edges of the upper. Fifteen claims of this patent describe in broad terms the organization of the present commercial machine. Typical claims are 1 and 3:—

"1. An eyeletting machine comprising suitable mechanism, and means for causing said mechanism to simultaneously set two eyelets in axial alignment in two layers of work, one superimposed upon the other."

"3. An eyeletting machine comprising two oppositely arranged sets, and an anvil disposed between said sets and having its faces formed to co-act therewith."

The machine of the Prime patent was only experimental and was not adapted for commercial use. A substantial step toward a com-

mercial machine is represented by patent No. 683,488, October 1, 1901, Pearson. Important features of the organization of the commercial machine are set forth in thirty-two claims of that patent.

Among the more notable of these features are mechanism for punching the holes in the material which was subsequently to receive the eyelets and the organization for feeding the work between successive eyelet-setting operations. There are many claims in this patent No. 683,488 directed to each of these features, of which claims 1 and 26 are typical: —

"1. In an eyeletting machine, the combination with a pair of punches and a pair of setting dies, of a support therefor, the members of each of said pairs being oppositely disposed, substantially as described."

"26. An eyeletting machine, having punching devices, two oppositely acting setting dies adapted to feed the work and a die plate co-acting with the setting dies both to set the eyelets and to feed the work, substantially as described."

The next important step in the development of this machine into commercial form is represented by patent No. 1,013,215, January 2, 1912, Pearson, granted upon an application filed May 18, 1903. The most important contribution to the machine described in the claims of this patent is the organization which enables the machine to adopt itself automatically to differences in the relative thickness of the stock on opposite sides of the lacing slit. Typical claims of this patent defining this organization are claims 21 and 22: —

"21. An eyeletting machine, having, in combination, two oppositely disposed work engaging tools and a self adjusting die block between them, substantially as described.

"22. An eyeletting machine, having, in combination, two oppositely disposed work engaging tools and a movable die block located between them and movable in the line of motion of the tools, substantially as described."

Fourteen claims of this patent No. 1,013,215 set forth mechanisms always embodied in the commercial machine.

The final step in the production of a satisfactory commercial machine is represented by patent No. 934,066, September 14, 1909, Goddu (application filed April 22, 1903).

Thirty-eight claims of this patent describe mechanisms always embodied in the commercial machine. It will perhaps be sufficient to quote only a typical claim : —

"34. An eyeletting machine, having, in combination, oppositely disposed eyelet sets, edge guides, and means for varying the positions of the edge guides during the operation of the machine, substantially as described."

Mechanism set forth in the claims of this patent, of which the quoted claim is typical, first provided the machine with means for adjusting its operation to vary the distance of the eyelets from the respective edges of the stock while the machine was running, thus enabling the operator to get the desired contour of the line of eyelets with relation to the edge of the stock. This improvement is particularly useful when the machine is eyeletting uppers of high-grade shoes, other than oxfords and bluchers, in most of which it is desired to set the eyelets at the lower end of the line of eyelets at a greater distance from the lacing slit than the eyelets above. Further improvements, some of which are incorporated in all commercial machines and others of which adapt the machine for special kinds of work, are shown and described in patents of later date than those which I have discussed, or it is anticipated will be the subjects-matter of patents yet to be granted.

Twelve hundred and nineteen Duplex eyeletting machines were in use in shoe factories on October 1, 1913. The average capacity of the Duplex eyeletting machine is 2500 pairs per day. One machine will set the eyelets of shoes which are to be welted on six or seven welt and turn sewing machines.

This Duplex eyeletting machine is put out by the United Company through its eyeletting department.

Mr. WEBSTER. The answer is objected to for that it relates wholly to matter that is immaterial, inadmissible and irrelevant and is in no sense in reply to, or in defence of, any evidence submitted by the petitioner before the examiner, and all reference to patents or mechanisms of patents or structures not shown in claims of patents issued prior to the filing of the petition herein is especially objected to as incompetent, inadmissible and irrelevant and as having no bearing on the questions involved herein.

Int. 122. Have you collected under a single cover the several Letters Patent referred to by you in your last answer as relating to the Duplex eyeletting machine?

Ans. I have, and I produce the volume.

[*Volume of patents relating to Duplex eyeletting machine as introduced in evidence, and marked "Defendants' Exhibit 196".*]

Mr. WEBSTER. The introduction of the patents offered in evidence is objected to as inadmissible, irrelevant and incompetent, and the introduction of all patents issued after the date of the filing of the petition herein is especially objected to as having no reference in any manner to the question involved herein.

Int. 123. Will you please give the number, date and name of patentee of the several patents contained in the volume which has just been offered in evidence as Defendants' Exhibit 196?

Ans. No. 636,175, October 31, 1899, Prime.

No. 672,056, April 16, 1901, Davey and Ladd.

No. 683,488, October 1, 1901, Pearson.

No. 926,903, July 6, 1909, Smith.

No. 934,066, September 14, 1909, Goddu.

No. 964,626, July 19, 1910, Dunphy.

No. 1,013,215, January 2, 1912, Pearson (application filed May 18, 1903).

No. 1,023,275, April 16, 1912, Rogers (application filed December 1, 1911).

No. 1,030,833, June 25, 1912, Rumney (application filed August 8, 1906).

No. 1,048,840, December 31, 1912, Littlefield (application filed November 2, 1906).

No. 1,057,068, March 25, 1913, Like (application filed June 28, 1909).

Int. 124. In the list of machines heretofore submitted by you, you refer to blacking machine, model A, crest heel, and blacking machine, model B, crest heel. What is the function performed by these machines in the process of making shoes, and what has been the development of this art since 1899? If the United Company is putting out any standard machine for this pur-

pose which embodies any mechanisms forming the subjects-matter of Letters Patent of the United Company, refer to such patents.

Mr. Webster. Question objected to because it calls for statements with reference to matter not referred to in any evidence submitted by the petitioner before the examiner, and is utterly immaterial, inadmissible and irrelevant with reference to the issues involved herein.

Ans. Before the heel-burnishing operation, that is, the final finishing operation on the heel, blacking must be applied to the edges of the heels of black shoes, and russet stain to the edges of the heels of russet shoes. The two machines inquired about, blacking machine, model A, crest heel, and blacking machine, model B, crest heel, are two differently organized machines which have been produced by the United Shoe Machinery Company for performing this operation. The present standard commercial machine is the model B machine.

Blacking Machine — Model A: Crest Heel.

At the time the United Company was formed, in February, 1899, the universal practice was to apply blacking or stain to heels with a hand brush, and it was one of the most inexpensive operations in the manufacture of shoes, as the work was always done by a boy or girl. The quality of the work was not satisfactory, however, as the blacking or stain was frequently splashed on the upper or on the tread face or breast edge of the heel. The great problem in devising a machine for performing this hand operation was, therefore, the producing of a machine which would meet the low labor cost of the hand operation by doing this work in a superior way and by doing a great deal more of it. The United Company produced a machine which met these conditions and which was first put out for commercial use in September, 1908, the machine then put out now being known as "Blacking Machine, Model A, Crest Heel." This machine comprised two rotary brushes so located that they applied blacking simultaneously to opposite sides of a heel. Each brush was especially constructed for both getting blacking into the rand crease, that is, the crease between the upper and the

upper edge of the sole above the heel, and spreading blacking on the body of the heel edge. Means were provided in the machine to prevent getting blacking upon the upper, and to avoid getting blacking upon the breast of the heel the brushes were rotated in opposite directions, both toward the breast of the heel. The machine was so organized that a boy or girl running it could not get blacking upon the upper or on the breast of the heel, and was so rapid in its operation that its average capacity was at least double that of the hand operation. The organization of this model A machine is defined in the claims of the following patents: —

No. 805,763, November 28, 1905, Tuttle.

No. 1,007,777, November 7, 1911, Furber.

No. 1,015,433, January 23, 1912, Furber (application filed July 29, 1910).

No. 1,056,454, March 18, 1913, Rollins (application filed September 12, 1907).

Referring to typical claims of these patents, claims 6 and 11 of patent No. 805,763 are as follows: —

"6. A machine of the class described, comprising a pair of rotary brushes arranged to act upon opposite sides of a heel, combined with a work rest arranged relatively to said brushes to be engaged by the heel when presented to either brush."

"11. A machine for finishing parts of boots and shoes, comprising a plurality of rotary work members having yielding peripheries and mounted with their acting peripheral faces adjacent and arranged to permit the heel of a boot or shoe to be advanced curved end foremost between them, said work members being rotatable in directions to cause the movement of their acting faces to be from said curved end toward the breast of the heel."

Representative claims of patent No. 1,056,454 are the 14th and 21st: —

"14. In a machine of the character described, the combination of a tank adapted to contain liquid material, a pair of brushes mounted to rotate on vertical axes side by side, means for simultaneously rotating said brushes, and means for lifting the liquid material out of said tank and applying same to each of the brushes."

"21. A heel blacking machine comprising, in combination, two rotary brushes for applying blacking arranged side by side and spaced apart to permit the partial introduction of a heel between

them, means for delivering blacking to said brushes and devices associated with said two brushes but additional to their working faces to locate the heel laterally between the brushes."

Twenty claims of this patent No. 1,056,454 set forth the organization of the model A machine.

In patent No. 1,007,777, Furber, which shows substantially the commercial machine, and describes the machine in thirty-three of its claims, typical claims are the following: —

"23. A heel blacking machine, having, in combination, a heel blacking brush comprising a thin section having short stiff bristles and tapered from its upper edge downwardly for forcing the blacking into the rand crease, and a thick section of soft bristles for wiping blacking upon the edge of the heel, and means for actuating the brush."

"41. A heel blacking machine, having, in combination, two rotary brushes for applying blacking to the opposite edges of a heel, means for adjusting said brushes from and toward each other into definite relations to act simultaneously upon opposite sides of heels of different widths, and a common driving means for rotating the brushes in their adjusted positions."

Between the date of its introduction in September, 1908, and March 1, 1913, the end of the company's last fiscal year, 173 of these machines were put out. The model A machine has a capacity of from 3600 to 4200 pairs per day, and a boy can black on the machine at least double the number of shoes that he can black by hand.

Blacking Machine — Model B: Crest Heel.

The model A machine proved acceptable for the lower-priced shoes, but it was not satisfactory for the better grades of shoes because it was found that the average boy operator could not be relied upon so to operate the machine that it would spread the blacking uniformly, and the machine therefore frequently put too much blacking in the rand crease and too much on the rear end of the heel. The machine was, however, used on the higher grades of work as well as upon the cheaper grades, and manufacturers of all grades of shoes would probably have continued to use it had they not been supplied with a more satisfactory machine. Soon after the model A machine had been put into commercial use the

United Company had started experimental work with a view to producing a machine which would apply blacking uniformly to all parts of the heel edge and on the rand, and which would eliminate the danger of imperfect work being caused by the carelessness of a boy operator. This experimental work resulted in the production of a radically new heel-blacking machine of an entirely different type, known as "Model B". This machine, which was first put into commercial use in May, 1911, is shown as it was then constructed in patent No. 1,025,523, May 7, 1912, Furber (application filed December 31, 1910).

[*Adjourned to 10 o'clock* A. M., *October 23, 1913.*]

BOSTON, MASS., October 27, 1913.

[*Ans. to Int. 124 continued:*]

This machine differs radically from the model A machine in that the blacking-applying brush moves across the heel from the top of the heel adjacent to the upper to the tread face of the heel, while the two brushes of the model A machine moved longitudinally of the heel and the shoe. This mode of operation of the model B machine insures the application of a uniform film of blacking all over the heel. A further important feature of the organization of this new model B machine is that one shape of brush is equally satisfactory on all the usual shapes of heels, while in the earlier model A machine brushes adapted for one shape of heel were not suited for heels of radically different shape.

The organization of this model B machine, including features to which I have not specifically referred, is defined in nearly all of the forty-five claims of patent No. 1,025,523, May 7, 1912 (granted on an application filed December 31, 1910, Furber). Of these claims the following are typical: —

"1. A machine of the class described comprising in combination, means movable across the heel edge to apply blacking thereto and additional means operating simultaneously therewith for applying blacking to the rand crease."

"9. A machine of the class described comprising in combination a rotary rand crease guide, means for supplying blacking to the rand engaging face of said guide and a rotatable brush arranged to take blacking from said guide and deliver it to the work."

"42. A machine of the class described comprising in combination, a brush mounted for operative movement, means for driving the brush, means for supplying blacking to the brush, and guiding means to engage the shoe during the blacking operation, said guiding means being so positioned with relation to the brush that the brush will move across the lifts of the shoe heel toward the tread face of the heel."

Some of the features of the organization of the model B machine were adopted from the model A machine and are set forth in general terms in some of the claims of patent No. 1,007,777, November 7, 1911, Furber. Typical claims directed to this feature are the following:—

"4. A machine of the class described having, in combination, means for blacking the rand crease of a shoe and means for blacking the edge of the heel, and means for supplying coloring material directly to the crease blacking means and indirectly to the edge blacking means."

"15. A heel blacking machine having, in combination, a blacking brush, means to actuate the brush, and means to straighten the bristles of the brush as it is actuated."

Since this model B machine was first put into commercial use it has been further improved, and it is expected that additional patent protection will be obtained upon these improvements.

Between May, 1911, and September, 1, 1913, one hundred and eighteen of these model B heel-blacking machines were put out. The average output of the machine is about 3000 pairs per day, which is over sixty per cent more than the average number of shoes which a hand workman will black in a day. The work done by this model B machine is so superior to the work of the earlier model A machine that the model B machine will probably entirely supersede the model A machine.

These two machines, blacking machine, model A, crest heel, and blacking machine, model B, crest heel, are put out by the United Company through its general department.

Mr. WEBSTER. The answer is objected to for that it relates to matters in no wise at issue or involved in the issues of this cause, and for the further reason that the answer relates to matters in reference to which no evidence has been submitted by the petitioner,

and said answer is not in reply to, or in defence of, any evidence submitted before the examiner; and for said reason the answer is objected to as inadmissible, irrelevant and incompetent.

The answer, in so far as it relates to patents or mechanisms of patents issued since the date of the filing of the petition herein, is objected to for the reasons aforesaid.

Int. 125. Have you collected under a single cover patents referred to by you in your last answer as relating to heel-blacking machines?

Ans. I have, and I produce the volume.

[*Volume of patents relating to heel-blacking machines is introduced in evidence, and marked "Defendants' Exhibit 197".*]

Mr. WEBSTER. The introduction of the patents offered in evidence is objected to as incompetent, inadmissible and immaterial, and all patents issued after the date of the filing of the petition herein are especially objected to as having no reference to matters involved herein.

Int. 126. Please give the number, date and name of patentee of each of the patents in the volume which has been offered in evidence as Defendants' Exhibit 197.

Ans. No. 805,763, November 28, 1905, Tuttle.

No. 1,007,777, November 7, 1911, Furber.

No. 1,015,433, January 23, 1912, Furber (application filed July 29, 1910).

No. 1,025,523, May 7, 1912, Furber (application filed December 31, 1910).

No. 1,056,454, March 18, 1913, Rollins (application filed September 12, 1907).

Int. 127. In the list of machines submitted by you in answer to a previous question (question No. 7), you referred to a machine designated as repairing machine, model A, patent leather. Please state what the function of that machine is in the manufacture of shoes, how such function was performed prior to 1899, and also state what improvements, if any, have been made by the United Company in this art since 1899, and their importance in the art. If such improvements form the subjects-matter of Letters Patent of the United Company, state the patents.

Mr. Webster. Question objected to for that it calls for matters having no bearing on the questions involved in this cause, and for the further reason that it calls for matter in no sense in reply to, or in defence of, matters presented by the petitioner before the examiner.

The petitioner also objects to all reference to patents or structures shown in patents issued after the date of the filing of the petition herein, and for the reasons aforesaid said question is objected to as incompetent, inadmissible and immaterial.

Repairing Machine — Model A: Patent Leather.

Ans. The machine inquired about, "Repairing Machine, Patent Leather", is used in the repairing of patent leather shoes before they are shipped from shoe factories to be marketed.

A large proportion of patent leather shoes, from a minimum of about forty per cent of shoes made of the better grades of patent leather to a maximum of over seventy per cent of shoes made from the cheaper grades of patent leather, have to be repaired after the making operation, before they can be marketed. Until quite recently this operation of repairing patent leather shoes was always done by hand. The necessity for the operation is due to the cracking in the patent leather which occurs during the lasting operation. This cracking is chiefly caused by the strain to which the leather is subjected in lasting it around the curved toe, so that most of the repairing has to be done on the toe tip, although occasional cracks occur in other parts of the upper which have to be repaired. These damaged portions must all be repaired before the shoe can be marketed, and in all factories making patent leather shoes a regular operation is that of patent leather repairing. A patent leather shoe which requires repairing before it could be marketed is shown in Defendants' Exhibit No. 13, and the patent leather shoes of Defendants' Exhibits Nos. 149 and 182 will obviously need repairing after the making operations are completed.

In this repairing operation enamel is first buffed off in the region of the cracks, as illustrated on the left portion of the toe tip in Defendants' Exhibit No. 13, and then liquid enamel must be applied

to the buffed portion. The application of this liquid enamel was so essentially a hand operation that it was done by putting the enamel on a soft cloth wrapped about the fingers of the workman, and rubbing it into the leather. Several coats of the enamel had to be applied to each buffed spot.

Probably no minor operation upon the shoe ever presented so difficult a problem for inventors as the devising of a machine for performing this hand operation properly and in such manner that it would effect a saving for the manufacturer to use the machine. The first problem was to devise a tool which would take the place of the operator's fingers and the soft cloth, and which, like them, would fit the curved surfaces around the toe and would also act satisfactorily in the crease between the welt and upper. The second problem was to devise means for operating this tool which again would take the place of the operator's fingers. The United Company's inventors in their experimental work soon found that a tool which had a reciprocating motion would rub the enamel off the spot to which it was the object of the operation to apply enamel, while a tool having a rotary motion would throw the enamel away from the centre of its revolution. The third problem was to meet the condition presented by the hand workman using each portion of the cloth until that portion had absorbed so much enamel that its surface was unfit for further use, and finally, after the entire cloth was thus rendered unfit for further use, throwing it away and taking another piece.

Over two years of constant experimenting were required before a machine was produced which was satisfactory for commercial use, and during this period several different machines were built and were discarded as useless. Early in 1911 a machine was produced which solved all of the problems to which I have referred. In this machiue the yielding character of the finger rubbing was produced by a spongy rubber tool. The cloth was provided in the form of an endless piece over a yard long, the necessary rubbing motion was obtained by imparting to the tool a very rapid movement approximately in the form of a figure eight, and moving the cloth as each successive portion of the cloth was unfit for further

use was provided for by making the tool in the form of a large roll, over and from which the cloth was stretched to another roll which supported and held it taut, and on which it was moved by means which, at the touch of a finger, would move the cloth just far enough to bring a new, fresh part of the cloth into operative position.

As already stated, the first machine which would perform this operation satisfactorily was produced early in 1911. As is the company's usual practice, this machine was given an extended trying out in a number of different factories under different commercial conditions, and was finally adopted as a commercial success in the summer of 1911, and manufacture of machines for commercial use was then begun.

No patent has as yet been granted upon this machine, but its organization is set forth in many allowed claims of a pending application for patent filed November 21, 1911. Improvements upon the machine shown in that application and defined in allowed claims are set forth in the claims of another pending application.

This machine, repairing machine, patent leather, is put out by the United Company through its general department. One hundred and fifteen machines were put out during the first year of its commercial use. The quality of the work done by the machine is superior to hand work, and it has an increased capacity over hand work of from a minimum of seventy-five per cent to a maximum of over 200 per cent, according to the quality of the shoes and the conditions under which the work is done. On an average, a saving of about one cent per pair is made in using the machine over hand work. In one factory operators are repairing at least 200 pairs per day on the machine, and in that factory where there are four machines each machine when running to its capacity is effecting a saving for the manufacturer of two dollars per day, or eight dollars for the four machines.

Mr. WEBSTER. Answer objected to for that it relates to matters in no wise involved in the issues in this cause, and further for the reason that reference is made in the answer to structures not shown in patents issued prior to the filing of the petition herein.

Further, the answer is objected to for the reason that it is not in

any sense in reply to, or in defence of, any evidence submitted by the petitioner before the examiner; and for the reasons aforesaid the answer is objected to as incompetent, inadmissible and irrelevant.

Int. 128. In answer to a prior question (question No. 7), you submitted a list of some of the important machines put out by the United Company, giving the official name of the machine, the date when it was first put out and the department of the United Shoe Machinery Company through which it was put out. In answer to previous questions you have already described a number of these machines and compared the mechanisms embodied therein with the subjects-matter of Letters Patent of the United Company. Will you please state the function in the shoe manufacturing art of the machines on that list to which you have not specifically referred, and if such machines have formed, or now form, the subjects-matter of Letters Patent of the United Company, state the patents.

Mr. WEBSTER. Question objected to for that it calls for matter in no way competent with reference to the issues involved in this cause, and in no wise in reply to, or in defence of, any evidence submitted before the examiner by the petitioner.

And for the reasons aforesaid the question is objected to as calling for matter which is inadmissible, incompetent and irrelevant.

ASSEMBLING MACHINE: REX TURN SHOE.
Pulling Over Department.

Ans. This is a machine used for inserting the tacks used in assembling, and sometimes used in lasting the sides of turn shoes, some of which tacks must be fully driven while others must be left with their heads projecting different distances. The machine is organized to provide by an instantaneous adjustment the desired depth of insertion for any tack or series of tacks. The machine was adopted in February, 1912. This machine is set forth in the claims of the following patents and pending applications, owned by the United Company: —

Patent No. 1,026,067, May 14, 1912, Ashton (application filed November 30, 1908).

One application for patent filed prior to December 12, 1911.
One application for patent filed since December 12, 1911.

BEADING MACHINE: COLUMBIA.
General Department.

This machine is used to turn inside out, and then to pound flat, the seam by which the upper and lining are fastened together wrong side out. The machine was adopted in 1907. This machine is set forth in the claims of the following patents owned by the United Company:—

Patent No. 623,872, April 25, 1899, Booth.

Patent No. 624,426, May 2, 1899, Booth.

Patent No. 1,027,411, May 28, 1912, Flynt (application filed December 14, 1908).

BEVELING MACHINE — MODEL B: CHAMPION STRIP.
General Department.

This machine is used to cut leather board into strips and to split the strips diagonally from corner to corner, preparatory to dieing out wedge heel lifts. It was first put out by the United Company in November, 1909, and is set forth in the claims of the following patents owned by the United Company:—

Patent No. 1,025,556, May 7, 1912, Winter (application filed June 3, 1908).

Patent No. 1,048,278, December 24, 1912, Benjamin (application filed April 7, 1911).

BUILDING MACHINE — PYRAMID HEEL: MODELS B, C, D.
General Department.

In the use of this machine heel lifts, either pieced or whole, are placed one upon another to produce a heel of the desired height, and the machine automatically aligns them and nails them together. The machine was first put out in June, 1909, and embodies mechanisms set forth in the claims of the following patent, and an application owned by the United Company:—

Patent No. 1,056,720, March 18, 1913, Tripp (application filed June 9, 1909).

One application for patent filed prior to December 12, 1911.

CEMENTING MACHINE: HUB LINING — MODELS E AND F.
General Department.

This machine is used to apply cement to doubling material which is inserted between the upper and the lining to strengthen the upper. The machine was adopted in 1908 and constitutes the subjects-matter of applications owned by the United Company as follows: —

One application for patent filed prior to December 12, 1911.

One application for patent filed since December 12, 1911.

CEMENTING MACHINE — MODEL X: STANBON CHANNEL.
General Department.

This machine is used to apply cement to the channel and channel flap of an out-sole preparatory to laying the flap over the stitches by which the sole is attached to the insole and upper. It is particularly adapted for McKay soles having wide channels. The machine was adopted in April, 1911, and its organization is set forth in the claims of a patent owned by the United Company: —

Patent No. 1,004,705, October 3, 1911, Stanbon.

CEMENTING MACHINE — STAR CHANNEL: MODELS A AND C.
General Department.

This machine is used to apply cement to the channel and channel flap preparatory to laying the flap over the stitches by which the out-sole is attached to the upper. It was adopted in October, 1906, and is described in the claims of the following patents owned by the United Company: —

Patent No. 743,929, November 10, 1903, Rollins.

Patent No. 1,013,735, January 2, 1912, Brogan (application filed November 19, 1908).

Patent No. 1,030,769, June 25, 1912, Brogan (application filed October 27, 1906).

CEMENTING MACHINE — STAR CHANNEL: MODEL D.
General Department.

This machine is used to apply cement to the channel and channel flap of the sole preparatory to laying the flap over the stitches by which the sole is attached to the upper. The machine is particularly designed for operating on McKay soles having wide channels. It was adopted in April, 1912, and embodies mechanisms set forth in the claims of patents owned by the United Company as follows: —

Patent No. 743,929, November 10, 1903, Rollins.

Patent No. 1,004,705, October 3, 1911, Stanbon.

Patent No. 1,013,735, January 2, 1912, Brogan (application filed November 19, 1908).

Patent No. 1,030,769, June 25, 1912, Brogan (application filed October 27, 1906).

CLINCH MACHINE — UNIVERSAL DOUBLE.
Metallic Department.

This machine is used to secure the out-sole of a metallic fastened shoe to the insole by means of a wire fastening which is clinched at both ends. The machine was first put out in November, 1899, and is defined in the claims of the following patents owned by the United Company: —

Patent No. 611,990, October 4, 1898, Casgrain.

Patent No. 669,023, February 26, 1901, Casgrain.

Patent No. 693,686, February 18, 1902, Casgrain.

Patent No. 765,650, July 19, 1904, Casgrain.

Patent No. 891,907, June 30, 1908, Casgrain.

Patent No. 1,030,971, July 2, 1912, Casgrain (application filed January 31, 1910).

The shoe which is produced by the operation of this machine and the fastening which is inserted by the machine, as well as the methods practiced by the use of the machine, are defined in the claims of the following patents owned by the United Company: —

Patent No. 669,022, February 26, 1901, Casgrain.

Patent No. 669,025, February 26, 1901, Casgrain.
Patent No. 669,026, February 26, 1901, Casgrain.
Patent No. 721,016, February 17, 1903, Casgrain.
Patent No. 724,432, April 7, 1903, Casgrain.

CUTTING AND SCORING MACHINE — INSOLE: MODELS D AND E.
General Department.

This machine is used to cut the ends of the lip of a welt insole, before the lip is turned up by the lip-turning machine. At the same time the machine also marks the insole, so as to guide the operators in sewing the inseam on the welt-sewing machine and in butting the welt; and simultaneously with these two operations the machine stamps the size number upon the insole and makes a mark to guide the operator in applying canvas if the insole is to be reinforced. The machine was adopted as a standard commercial machine in December, 1911. There was no machine for doing this work in 1899. The organization of the machine is set forth in the following patents and applications for patents owned by the United Company: —

Patent No. 957,598, May 10, 1910, Cook.

Patent No. 1,033,764, July 23, 1912, Mirandette (application filed February 1, 1911).

Two applications for patents filed prior to December 12, 1911.

EMBOSSING MACHINE — MODEL B.
General Department.

This machine is used for embossing a trademark, the name of the manufacturer or the retailer's name on the inside of the upper of a shoe. The embossing is usually done with gold leaf or bronze powder. The machine was first put out for commercial use in January, 1911, and is defined in the claims of patents and applications owned by the United Company as follows: —

Patent No. 1,028,567, June 4, 1912, Gordon and Topham (application filed December 23, 1903).

One application for patent filed prior to December 12, 1911.

Two applications for patents filed since December 12, 1911.

EYELETTING MACHINE — CAMEO: FOOT POWER.
Eyeletting Department.

This is a foot-power machine for inserting eyelets in material previously punched, and it is used for setting odd eyelets and eyelets of special shapes. It was first put out in April, 1910, and constitutes the subject-matter of an application for patent owned by the United Company as follows: —

One application for patent filed prior to December 12, 1911.

EYELETTING MACHINE — UNIVERSAL.
Eyeletting Department.

This is a machine for inserting eyelets in shoe uppers, and comprises automatic means for punching holes for the eyelets, inserting the eyelets and feeding the work. It was adopted in November, 1902, and among the patents and applications owned by the United Company which define the organization of this machine are the following: —

Patent No. 603,023, April 26, 1898, Field.

Patent No. 638,994, December 12, 1899, Smith.

Patent No. 672,056, April 16, 1901, Davey et al.

Patent No. 880,376, February 25, 1908, Field.

Patent No. 1,048,840, December 31, 1912, Littlefield (application filed November 2, 1906).

One application for patent filed prior to December 12, 1911.

FASTENING MACHINE — MODEL D: STAPLE.
Metallic Department.

This machine makes and drives staples and is used in tacking outsoles to the insoles of light-weight McKay sewed shoes, women's, misses' and children's, to hold them in place until the soles are permanently secured, also for tacking insoles of welt shoes to lasts and for other miscellaneous tacking. The machine was adopted in January, 1907, and has embodied or now embodies mechanisms set forth in the claims of patents owned by the United Company as follows: —

Patent No. 447,681, March 3, 1891, Hamm.

Patent No. 571,227, November 10, 1896, Hamm and Eaton.

Patent No. 765,650, July 19, 1904, Casgrain.

Patent No. 899,093, September 22, 1908, Ashton.

Patent No. 1,016,930, February 13, 1912, Borden (application filed January 16, 1905).

FINISHING MACHINE — U S M C: BUTTONHOLE.
Fitting Room Department.

This machine is used after buttonholes have been sewed on "Making Machine, Buttonhole", to gather in line both the loose ends of the threads and the stay cord which is used to reinforce the edges of the buttonholes, and then to bind down by blind stitches said ends and cord upon the under face of the buttonhole piece. After experimental work begun some time before December 12, 1911, this machine was adopted in January, 1913. It constitutes the subjects-matter of pending applications owned by the United Company as follows: —

Three applications filed prior to December 12, 1911.

One application filed since December 12, 1911.

FLEXIBLE INNERSOLE MACHINE — MODEL X: GOODYEAR.
Goodyear Department.

This machine is used to make a welt insole flexible by forming slashes between the lips extending part way through the insole at an angle to its surface, the machine automatically varying the lengths of the slashes according to the distance between the insole lips. The machine was adopted in January, 1911, and is defined in the claims of patents owned by the United Company as follows: —

Patent No. 539,835, May 28, 1895, Tirrell.

Patent No. 871,967, November 26, 1907, Stewart.

Patent No. 871,969, November 26, 1907, Stewart.

Patent No. 958,029, May 17, 1910, Stewart.

The United Company also owns a patent on the insole which is produced by the operation of this machine, which is: —

Patent No. 871,968, November 26, 1907, Stewart.

FUDGE EDGE MACHINE: GOODYEAR.
Goodyear Department.

This machine "sets" or burnishes the edge of a shoe sole and simultaneously wheels the upper face of the sole edge to form imitation stitch impressions. It is used on light McKay sewed or turned shoes. A sample of the work of this machine is shown in Defendants' Exhibit 30. The machine was adopted in May, 1908, and is defined in the claims of a patent owned by the United Company as follows: —

Patent No. 852,703, May 7, 1907, Carnes.

GROOVING AND BEVELING MACHINE — GOODYEAR: POWER WELT.
Goodyear Department.

This is a machine for grooving and beveling a strip of welting preparatory to its attachment with the upper to the insole by the welt-sewing machine. The groove is formed to receive the thread of the inseam and the beveling facilitates proper seating of the welt against the upper and insole lip. The machine was first put out in July, 1906, and is defined in the claims of the United Company's patent —

No. 1,020,346, March 12, 1912, Eppler (application filed July 30, 1906).

LAYING MACHINE — MODEL A: APEX WELT.
General Department.

This machine is used to cement a mock welt to the edge of a McKay sole before the sole is attached to the shoe. The machine was adopted for commercial use in February, 1910, and is defined in the claims of the United Company's patent —

No. 1,005,394, October 10, 1911, Winter.

LAYING MACHINE — MODEL X: APEX WELT.
General Department.

This machine lays a McKay welt on a McKay sole and cuts off the welt after it is laid. It was adopted in February, 1911, and its mechanism is set forth in the claims of the United Company's patent —

No. 957,987, May 17, 1910, McLeod.

LAYING MACHINE — GOODYEAR CHANNEL.
Goodyear Department.

This machine is used to turn down over the outseam the channel flap of an out-sole after the out-sole has been stitched to the welt. Prior to this operation both flap and channel are cemented on the channel-cementing machine to make the flap stick when it is turned down. The United Company's patents which set forth the mechanisms embodied in this machine are as follows: —

No. 576,114, February 2, 1897, Hadaway.

No. 759,273, May 10, 1904, Hadaway.

No. 981,190, January 10, 1911, Hadaway.

LAYING MACHINE — GOODYEAR IMPROVED SOLE: MODELS B AND C.
Goodyear Department.

This is an improved machine for pressing a cemented out-sole with uniform predetermined pressure against the bottom of a welt shoe to hold the out-sole in place while it is being rounded and channeled, and until the out-sole is finally secured to the welt by the out-sole stitching machine.

This machine was adopted in December, 1910, and its organization is defined in the claims of the following patents owned by the United Company: —

No. 694,367, March 4, 1902, Gifford.

No. 930,272, August 3, 1909, Davenport.

No. 942,133, December 7, 1909, Davenport.

No. 1,066,473, July 8, 1913, Davenport (application filed October 10, 1910).

LAYING MACHINE — GOODYEAR IMPROVED SOLE: TWIN.
Goodyear Department.

This machine is used to secure an out-sole temporarily to the bottom of a welt shoe by cement to hold the out-sole in place during the rounding and channeling operation and until the out-sole is permanently attached to the welt by the out-sole stitching machine. This machine was adopted and first put out in December,

1906, and is defined in the claims of the following patents owned by the United Company: —

Patent No. 694,367, March 4, 1902, Gifford.

Patent No. 781,636, February 7, 1905, Davenport.

Patent No. 930,272, August 3, 1909, Davenport.

Patent No. 942,133, December 7, 1909, Davenport.

LEVELING AND FLEXING MACHINE — MODEL N: SHIN.

General Department.

This machine is used to flatten out "shins" or portions of the hide which come off the legs. The machine scores or cuts the stock on the flesh side and rolls it. The organization of the machine is defined in the United Company's patent —

No. 740,709, October 6, 1903, Stowe.

MAKING MACHINE: BUTTONHOLE.

Fitting Room Department.

This machine cuts a buttonhole in the upper of a button shoe and sews around its edge with binding stitches which pass over the edge of the material and over a stay cord. After several years of experimenting, begun some time before December 12, 1911, the machine was finally adopted and put out for commercial use on January 1, 1913. The organization of the machine is defined in the claims of patents and pending applications for patents owned by the United Company as follows: —

Patent No. 1,063,729, June 3, 1913, Ray (application filed August 28, 1912).

Patent No. 1,063,795, June 3, 1913, Hill (application filed November 12, 1912).

Patent No. 1,063,880, June 3, 1913, Hill (application filed February 10, 1912).

Two applications filed prior to December 12, 1911.

Three applications filed since December 12, 1911.

MARKER: IMPROVED STAR SOLE.

General Department.

This is an implement for marking sizes and half sizes on soles

preparatory to sorting them in lots of the same size. It was first put out in October, 1910. The mechanisms embodied in this implement are defined in the claims of patents and a pending application owned by the United Company as follows: —

Patent No. 509,576, November 28, 1893, Gordon.

One pending application for patent filed prior to December 12, 1911.

MARKING MACHINE — MODEL C: PARAGON VAMP.
General Department.

This machine is used to make on the vamp portion of an upper marks which indicate the lines on which the toe tip and blucher quarters should be attached. It also marks the median line of the vamp to facilitate the pulling-over operation. The machine was first put out for commercial use in May, 1906, and its organization is defined in the claims of patents owned by the United Company as follows: —

Patent No. 968,746, August 30, 1910, Davenport.

Patent No. 1,030,275, June 25, 1912, Bayley (application filed April 17, 1906).

MOLDING MACHINE — AMERICAN TWIN SOLE: MODELS B AND C.
General Department.

This machine is used to bend an out-sole before it is attached to a shoe in order to fit it approximately to the bottom of the last. It was adopted in May, 1907, and is defined in the claims of patents and applications owned by the United Company as follows: —

Patent No. 627,122, June 20, 1899, Keighley.

Patent No. 935,212, September 28, 1909, Manent.

Patent No. 997,927, July 11, 1911, Mayo.

Patent No. 1,003,970, September 26, 1911, Ball.

Patent No. 1,003,971, September 26, 1911, Ball.

Patent No. 1,004,075, September 26, 1911, Preble.

Patent No. 1,004,076, September 26, 1911, Preble.

Patent No. 1,048,579, December 31, 1912, Preble (application filed August 8, 1910).

Two pending applications for patents, both filed prior to December 12, 1911.

MOLDING MACHINE: GOODYEAR POWER.
Goodyear Department.

This machine is used to bend down the margin of a thick-edged turn sole, before it is put on the last, so that it will clear the needle of the turn-sewing machine while the upper is being attached. This machine was adopted in June, 1910, and constitutes the subject-matter of a pending application owned by the United Company as follows:—

One application filed prior to December 12, 1911.

MOLDING MACHINE: STITCH-DOWN UPPER.
General Department.

This machine performs the operation of molding to shape the heel and toe ends of the uppers of that class of stitch-down shoes which have the insoles attached before the uppers are placed upon the lasts. A stitch-down shoe is one in which the lower edge of the upper is turned outwardly, forming a flange to which the outsole is secured. Sandals and some children's shoes are made this way. This machine was first put out for commercial use in November, 1907, and its organization is set forth in patents and pending applications owned by the United Company as follows:—

Patent No. 871,963, November 26, 1907, Stewart.

Patent No. 871,966, November 26, 1907, Stewart.

Patent No. 947,895, February 1, 1910, Engel.

Patent No. 998,682, July 25, 1911, Engel.

Patent No. 1,001,745, August 29, 1911, Engel.

Patent No. 1,027,408, May 28, 1912, Engel (application filed August 5, 1907).

One pending application for patent filed prior to December 12, 1911.

NURLING MACHINE — MODEL A.
Heeling Department.

This machine is used to make a row of ornamental indentations around the margin of the tread face of a shoe sole. It was adopted

in July, 1901, and is defined in the claims of the United Company's patent No. 768,560, August 23, 1904, Casgrain.

OPENING MACHINE — MODEL C: APEX CHANNEL.
General Department.

This machine is used to lift and lay back the channel flap on the sole of a McKay sewed shoe, so as to expose the channel for the subsequent stitching and cementing operations. The machine was adopted in July, 1906, and its organization is defined in the claims of patents owned by the United Company as follows: —

Patent No. 1,004,614, October 3, 1911, Winter.

Patent No. 1,007,685, November 7, 1911, Furber.

Patent No. 1,030,630, June 25, 1912, Winter (application filed April 3, 1908).

PERFORATING MACHINE — MODEL B: ROYAL.
General Department.

This is a machine, operating step by step, which is used to make an ornamental row of perforations along the margin of upper stock and it is particularly adapted for curved work. The machine was first put out for commercial use in October, 1904, and embodies mechanisms set forth in the claims of patents owned by the United Company as follows: —

Patent No. 701,107, May 27, 1902, Treen.

Patent No. 941,704, November 30, 1909, Flynt.

PERFORATING MACHINE — MODEL M: STANBON.
General Department.

This is a step-by-step machine which is used to make an ornamental row of perforations along the margin of upper stock; it is capable of wider spacing than perforating machine, model B, Royal, and also operates more rapidly along straight edges. This machine was adopted in April, 1911, and is defined in the claims of the United Company's patents as follows: —

Patent No. 640,426, January 2, 1900, Stanbon.

Patent No. 955,711, April 19, 1910, Stanbon.

PINCER: U S M C, BENCH.
General Department.

This is a machine for drawing uppers of assembled shoes forwardly on the last preparatory to presentation of the shoe to the pulling-over machine. The machine was adopted and first put out for commercial use in August, 1911, and is defined in the claims of patents and applications of the United Company as follows: —

Patent No. 1,030,579, June 25, 1912, Gorsuch (application filed November 1, 1910).

One pending application for patent filed prior to December 12, 1911.

PRICKING MACHINE: PREMIER HEEL.
Heeling Department.

This is a power machine for punching holes in high heels to receive and guide the nails which are subsequently driven by the heel-attaching machine, to attach the heel to the shoe. It was adopted in July, 1903, and as now being supplied to manufacturers embodies mechanism defined in claims of the United Company's patent No. 1,057,011, March 25, 1913, Sargent (application filed March 15, 1911).

PUNCHING MACHINE — MODEL A: ROYAL TIP.
General Department.

This is a gang machine, used to make an ornamental row of perforations all at once in the margin of the toe tip. The machine was adopted in May, 1911, and is defined in the claims of the following patents and pending applications: —

Patent No. 783,403, February 21, 1905, Knight.

One pending application filed since December 12, 1911.

QUILTING MACHINE: SPATTER.
Metallic Department.

This machine forms and drives slugs or nails of wire into the out-sole of a shoe, to increase the wearing qualities of a sole. It is used principally upon boys' and children's shoes. The United

Company's patents which define the organization of this machine are the following: —

Patent No. 765,650, July 19, 1904, Casgrain.

Patent No. 1,019,118, March 5, 1912, Ashton (application filed May 16, 1901).

REDUCING MACHINE — MODEL A: ROTARY FEATHER EDGE AND SHANK.

General Department.

This machine is used to thin, by beveling, the shank portion of a sole before the sole is attached to a shoe. The machine was first put out in November, 1904, and embodies mechanism defined in the claim of the United Company's patent No. 1,003,981, September 26, 1911, Busell.

ROUNDING MACHINE: GOODYEAR HEEL SEAT.

Goodyear Department.

This machine removes the surplus stock from the sole around the heel end of a welt shoe after the sole has been attached to the shoe and leveled. The outline of the heel end of the sole before this operation is indicated by Defendants' Exhibit No. 102. This machine was first adopted in August, 1909, and its organization is defined in patents owned by the United Company as follows: —

Patent No. 613,228, November 1, 1898, Barbour.

Patent No. 1,005,545, October 10, 1911, Heys.

Patent No. 1,005,573, October 10, 1911, Phelan.

Patent No. 1,027,638, May 28, 1912, Allen (application filed August 24, 1908).

Patent No. 1,034,560, August 6, 1912, Allen (application filed July 16, 1909).

ROUNDING MACHINE: PLANET SOLE — MODELS C AND D.

General Department.

This machine is used to shape a sole blank according to the contour of a pattern upon which the blank is supported, and it is used for shaping insoles of all kinds of shoes and for shaping out-soles for shoes other than welt. The machine was first put out in

November, 1901, and has embodied, or now embodies, mechanism defined in the claims of patents and pending applications owned by the United Company as follows: —

Patent No. 579,870, March 30, 1897, Hartford.

Patent No. 881,994, March 17, 1908, Allen.

Patent No. 882,009, March 17, 1908, Mayo.

Patent No. 1,048,511, December 31, 1912, Eaton (application filed December 5, 1907).

Two pending applications for patents filed prior to December 12, 1911.

One application for patent filed since December 12, 1911.

ROUNDING AND RANDING MACHINE: GOODYEAR HEEL SEAT.
Goodyear Department.

This machine removes the surplus stock from the out-sole around the heel end of the welt shoe, and rands the heel seat, that is, smooths off the projecting edge portion of the sole next to the upper. This machine was adopted and first put out in January, 1913, after several years of experimental work begun some time prior to December 12, 1911, and constitutes the subject-matter of a pending application for patent owned by the United Company as follows: —

One application filed April 4, 1912.

SANDING MACHINE — MODEL A: TAP AND SOLE.
Heeling Department.

This machine is used to buff or smooth box toes, counters and insoles. It was adopted in June, 1908, and the patents and pending applications owned by the United Company which define its organization are: —

Patent No. 868,021, October 15, 1907, Scott.

One pending application for patent filed prior to December 12, 1911.

SCARFING MACHINE — MODEL N: TAP.
General Department.

This machine is used to form a bevel on the rear edge of "taps"

or "slip soles", which are inserted between the out-sole and insole in the forepart to provide a double sole in the forepart. The machine was adopted in September, 1910, and constitutes the subject-matter of a pending application owned by the United Company:—

One application filed prior to December 12, 1911.

SCALLOPING MACHINE — MODEL B: TOP PIECE.
General Department.

This machine is used to cut an ornamental scollop in the breast edge of a heel. It was adopted in May, 1905, and is defined in the claims of the United Company's patent —

No. 1,030,567, June 25, 1912, Busell (application filed August 8, 1906).

SCOURING MACHINE — MODEL X: HEEL.
General Department.

This machine is used to scour the sides of a heel and to smooth or straighten the corners at which the sides and breast meet. The machine was adopted in November, 1911, and is defined in the United Company's patents as follows:—

Patent No. 883,445, March 31, 1908, Bohr.

Patent No. 957,993, May 17, 1910, McLeod.

SCREW MACHINE: RAPID STANDARD.
Metallic Department.

This machine screws the end of a double-threaded wire through the out-sole and the insole of coarse shoes to attach the out-sole to the insole, the machine automatically cutting off the screw flush with the outer face of the out-sole as soon as its end has reached the inner face of the insole. These shoes are known as "standard screw shoes".

Among the patents owned by the United Company, the claims of which define the organization of this machine, are the following:—

Patent No. 490,621, January 24, 1893, Goddu.

Patent No. 565,073, August 4, 1896, Goddu.

Patent No. 908,437, January 5, 1909, Ambler.

Patent No. 1,005,921, October 17, 1911, Ambler.

SCREW MACHINE — MODEL B: RAPID STANDARD.
Metallic Department.

This machine is an improved model of the rapid standard screw machine, the improvement insuring more accurate measurement of the length of the fastenings according to the thickness of the work, and facilitating the presentation of the work to the machine and the removal of the work. This model was adopted in January, 1912, and it is defined in the claims of patents and pending applications owned by the United Company as follows: —

Patent No. 565,073, August 4, 1896, Goddu.

Patent No. 582,579, May 11, 1897, Cutter.

Patent No. 691,354, January 21, 1902, Casgrain.

Patent No. 898,435, September 15, 1908, Casgrain.

Patent No. 908,437, January 5, 1909, Ambler.

Patent No. 1,005,921, October 17, 1911, Ambler.

One pending application for patent filed prior to December 12, 1911.

SKIVING MACHINE —MODEL A: CHAMPION HEEL LIFT.
General Department.

This machine is used to bevel leather heel lifts to form wedge lifts for use in high-pitched heels. The machine was first put out for commercial use in September, 1907, and is defined in the claims of patents, and of pending applications for patents, owned by the United Company as follows: —

Patent No. 894,850, August 4, 1908, Nash.

Two pending applications for patents filed prior to December 12, 1911.

SKIVING MACHINE —MODEL A: CHAMPION SHANK.
General Department.

This machine is used to cut out from a died-out blank a "shoe shank", a stiffening piece which is placed between the insole and the out-sole in the shank portion of a shoe. The machine was adopted in January, 1909, and is defined in the claims of patents and pending applications owned by the United Company as follows: —

Patent No. 894,850, August 4, 1908, Nash.

Three pending applications for patents filed prior to December 12, 1911.

SKIVING MACHINE: EROS BRAND.

Heeling Department.

This machine is used to cut from the waste skiving produced by the Monarch skiving and finishing machine a heel rand which is tacked around the edge of the upper portion of a heel to provide a proper seat for the heel portion of the sole. The machine was first put out for commercial use in August, 1906, and is defined in the claim of the United Company's patent —

No. 1,001,073, August 22, 1911, Pope.

SKIVING MACHINE — PLUMA: MODELS C AND D.

General Department.

This machine is used to bevel the edge of upper stock preparatory to folding the edge. It is capable of making a wider bevel than can be made by the Amazeen skiving machine, and it can be used on heavier stock. The machine was adopted in April, 1909, and its organization is set forth in the claims of the following patents and pending applications of the United Company: —

Patent No. 632,990, September 12, 1899, Dunham.

Patent No. 650,349, May 22, 1900, Bayley.

Patent No. 1,003,409, September 19, 1911, Alexander.

Patent No. 1,029,176, June 11, 1912, Davenport (application filed December 26, 1911).

Five pending applications for patents filed prior to December 12, 1911.

SKIVING AND FINISHING MACHINE: MONARCH COUNTER AND BOX TOE.

Heeling Department.

This machine is used to bevel the edges of counter stiffeners and toe stiffeners. It was adopted in January, 1903, and its organization is defined in patents owned by the United Company as follows: —

Patent No. 671,072, April 2, 1901, Scott.

Patent No. 703,617, July 1, 1902, Scott.
Patent No. 760,025, May 17, 1904, Scott.
Patent No. 760,082, May 17, 1904, Scott.
Patent No. 777,550, December 13, 1904, Scott.
Patent No. 961,736, June 14, 1910, Scott.
Patent No. 969,987, September 13, 1910, Scott.
Patent No. 975,495, November 13, 1910, Bayley and Mayo.

SKIVING OR RAND SPLITTING MACHINE — MODEL C: APEX TAP.
General Department.

This machine is used to cut stock into strips and to split the strips diagonally from corner to corner to make rands and to bevel the rear edges of taps and slit soles which are placed between the forward portion of the insole and the out-sole. The machine was adopted in January, 1908, and its organization is defined in the claims of the United Company's patent.

No. 1,025,556, May 7, 1912, Winter (application filed June 3, 1908).

SLASHING MACHINE: XX WELT.
General Department.

This machine is used to form a series of inclined slits along one edge of a strip of welting so that the welts can be made more readily to conform to the contour of an out-sole for a mock welt shoe, either McKay sewed or metallic fastened. The machine was adopted in February, 1911, and is defined in the claims of the United Company's patents as follows: —

Patent No. 737,430, August 25, 1903, Lyon.
Patent No. 745,965, December 1, 1903, Lyon.

SNIPPING MACHINE: GOODYEAR INSOLE TOE.
Goodyear Department.

This machine is used to notch the lip at the toe of a channeled welt insole so that it may more readily be turned up and set by the lip-turning machine. The machine was adopted in May, 1911, and constitutes the subject-matter of a pending application owned by the United Company as follows: —

One pending application for patent filed prior to December 12, 1911.

SOFTENING MACHINE — TOE: MODELS C AND D.
General Department.

These machines are used to soften and render pliable, by means of steam or moist vapor, toe portions of shoes, preparing them for the toe-lasting operation. The necessity for this operation was created by the development of modern lasts. The first model was adopted in August, 1911. These machines constitute the subjects-matter of pending applications owned by the United Company as follows: —

Five pending applications for patents all filed prior to December 12, 1911.

SOFTENING MACHINE — TOE: MODEL E.
General Department.

This is another machine used for softening and rendering pliable the toe portions of shoes to prepare them for the lasting operation. This result is obtained by subjecting the toe portions of the shoes to the action of steam or moist vapor which is generated within the machine. This machine, which was adopted in April, 1912, constitutes the subjects-matter of pending applications for patents owned by the United Company as follows: —

Five pending applications for patents all filed prior to December 12, 1911.

SPLITTING MACHINE — EMPIRE: MODELS C AND D.
General Department.

This machine is used to slit the heel portion of an out-sole either (1) in such manner as to form a pocket to receive a cushion heel lift, or (2) so as to form a flap which may be bent down and fastened to the breast of a high wooden heel. The machine was adopted in September, 1908, and is defined in the claims of patents and pending applications owned by the United Company as follows: —

Patent No. 745,591, December 1, 1903, Furber.

One pending application for patent filed prior to December 12, 1911.

SPLITTING MACHINE: SUMMIT.

General Department.

This machine is used to split or "even" soles by removing portions from the flesh side to make the soles of uniform thickness. The machine was first put out for commercial use in April, 1903, and is defined in the claims of the following patent owned by the United Company: —

Patent No. 894,850, August 4, 1908, Nash.

STAMPING MACHINE — MODEL C: EAGLE SOLE.

General Department.

This machine is used for impressing the size and width indications on loose soles. It is organized to permit different combinations of indicating marks so that it can be adjusted to mark properly soles of all sizes and widths. The machine was adopted and first put out for commercial use in March, 1910, and is defined in the claims of the United Company's patents and pending applications as follows: —

Patent No. 1,028,567, June 4, 1912, Gordon and Topham (application filed December 23, 1903).

One pending application for patent filed prior to December 12, 1911.

STAMPING MACHINE — MODEL C: EAGLE UPPER.

General Department.

This is a machine for impressing size, width, and, if desired, case marking or other identifying indications, on parts of uppers. It is organized to permit of a large number of combinations of indicating marks so that it can be adjusted to stamp any desired combination of as many as a dozen different symbols. The machine was adopted in March, 1910, and its organization is set forth in the claims of the United Company's patents and pending applications for patents as follows: —

Patent No. 1,028,567, June 4, 1912, Gordon and Topham (application filed December 23, 1903).

One pending application for patent filed prior to December 12, 1911.

STAMPING MACHINE — REGENT: MODELS B AND C.
General Department.

This is a machine for stamping trademarks or the name of manufacturer or dealer on the sole or welt of a finished shoe. It is constructed to operate in the same manner automatically on any thickness of stock. The machine was adopted and first put out in May, 1903, and its mechanism is defined in the claims of the following patents owned by the United Company: —

Patent No. 1,022,412, April 9, 1912, Gillespie (application filed October 7, 1908).

Patent No. 1,028,567, June 4, 1912, Gordon and Topham (application filed December 23, 1903).

STICKING MACHINE — MODEL B: SHANK PIECE.
General Department.

This machine is used to apply adhesive to a "shoe shank", a stiffening piece which is placed between the out-sole and insole in the shank portion of a shoe. The machine was adopted in September, 1911, and is defined in the claims of the United Company's patent —

No. 1,048,527, December 31, 1912, Hadaway (application filed October 3, 1910).

TACKING MACHINE — MODEL A: GRIP.
Metallic Department.

This machine makes and drives pointed nails, and is used for attaching the out-sole to the insole of the heaviest standard screw and pegged work, to hold the out-sole in place until it is permanently secured. The point of the nail is clinched upon the inside of the insole. The machine is defined in the claims of the following patents owned by the United Company: —

Patent No. 555,314, February 25, 1896, Flint.

Patent No. 591,658, October 12, 1897, Robinson.

Patent No. 765,650, July 19, 1904, Casgrain.

TACKING MACHINE — MODEL B: GRIP.
Metallic Department.

This machine is an improved model of the grip-tacking machine, and is used for the same classes of work as the model A machine except that the model B machine can be used on work requiring a longer nail than can be handled by the model A machine, owing to improvements in the nail forming and guiding mechanism. This machine was adopted and first put out in 1909, and is defined in the claims of the United Company's patents as follows: —

Patent No. 555,314, February 25, 1896, Flint.
Patent No. 591,658, October 12, 1897, Robinson.
Patent No. 765,650, July 19, 1904, Casgrain.
Patent No. 910,149, January 19, 1909, Perry.

TACKING MACHINE NO. 1 — U S M C: INSOLE.
Metallic Department.

This machine, which drives a headed tack, is used to secure the insole of a welt shoe upon the bottom of the last by means of tacks, preparatory to the lasting operation. The machine was adopted in 1910 and forms the subject-matter of —

One pending application filed January 2, 1912.

TACKING MACHINE: POWER WELT.
Metallic Department.

This machine is designed and used for tacking a false welt around the margin of the sole of a McKay sewed shoe before the sole is attached to the shoe, and comprises means for supporting and guiding both the sole and the welt. Among the United Company's patents containing claims which define mechanisms embodied in this machine are: —

Patent No. 490,625, January 24, 1893, Goddu.
Patent No. 568,248, September 22, 1896, Goddu.
Patent No. 611,405, September 27, 1898, Casgrain.

TRIMMING MACHINE: SPRING HEEL.
Heeling Department.

This machine trims the edges of the heels of spring-heeled shoes, such as are illustrated in Defendants' Exhibit No. 14. The organization of the machine is defined in the United Company's patents as follows:—

Reissue Patent No. 11,770, September 5, 1899, Mayo (original patent No. 609,518, August 23, 1898).

Patent No. 735,546, August 4, 1903, Mayo.

TRIMMING MACHINE: ULTIMA HEEL.
Goodyear Department.

This machine is used to trim the edge of a heel of a shoe after the heel has been secured to the shoe, and it gives to the heel edge its final shape. The machine was adopted in December, 1904, and its organization is defined in the claims of patents and pending applications owned by the United Company as follows:—

Patent No. 961,752, June 21, 1910, Busell.

Patent No. 999,050, July 25, 1911, Matthews.

Patent No. 1,049,309, December 31, 1912, Matthews (application filed May 2, 1910).

One pending application for patent filed prior to December 12, 1911).

TURNING MACHINE: GOODYEAR FOREPART.
Goodyear Department.

This machine is used to turn right side out the forepart portion of a turn shoe after the sole has been attached on the turn sewing machine, and after the heel portion has been turned by the turning machine, Goodyear heel. The machine was adopted in April, 1901, and is defined in the claims of the United Company's patents as follows:—

Patent No. 706,038, August 5, 1902, Eppler.

Patent No. 1,022,660, April 9, 1912, Dow (application filed March 29, 1911).

Turning Machine: Goodyear Heel.
Goodyear Department.

This machine is used to turn right side out the heel portion of a turn shoe after the sole has been sewed to the upper on the turn sewing machine. The machine was adopted in April, 1901, and is defined in the claims of the United Company's patents as follows:

Patent No. 460,526, September 29, 1891, Edgerly.
Patent No. 594,810, November 30, 1897, Ryan.
Patent No. 763,620, June 28, 1904, Meyer.
Patent No. 851,737, April 30, 1907, Eppler.
Patent No. 944,260, December 28, 1909, Eppler.

Turning Machine: Goodyear Lip.
Goodyear Department.

This machine is used to turn and set the lip of a welt insole before the insole is attached to the last. The organization of this machine is defined in the claims of the following patents owned by the United Company: —

Patent No. 623,306, April 18, 1899, Coupal and Gordon.
Patent No. 635,772, October 31, 1899, Hadaway.
Patent No. 638,010, November 28, 1899, Hadaway.

Turning Machine: Goodyear Welt Edge.
Goodyear Department.

This machine prepares the welt of close-edged women's shoes for the wheeling or other finishing operation by turning a portion of the outer edge of the welt upwardly and backwardly over the outseam and smoothing down the stock so turned backwardly to cause it to conceal the stitches of the outseam, which otherwise would appear upon the upper surface of the welt. This machine was adopted and first put out in December, 1909, and its organization is defined in the claims of the following patents owned by the United Company: —

Patent No. 993,543, May 30, 1911, Olson.

Patent No. 1,026,032, May 14, 1912, Hadaway (application filed January 22, 1910).

Patent No. 1,026,033, May 14, 1912, Hadaway and Allen (application filed March 7, 1910).

WHEELING MACHINE No. 2: GOODYEAR IMPRESSION STITCH.

General Department.

This machine wheels or makes a series of imitation stitch impressions on the upper projecting marginal surface on the forepart of the sole of a McKay sewed shoe, and on the corresponding surface of the welt of a welt shoe. This machine was adopted by the United Company in June, 1908, and its patents which define in their claims the organization of the machine are as follows: —

Patent No. 584,597, June 15, 1897, Mower.

Patent No. 690,422, January 7, 1902, Hadaway.

Patent No. 784,263, March 7, 1905, Heys.

Patent No. 906,705, December 15, 1908, Hadaway.

Patent No. 958,913, May 24, 1910, Flynt.

Mr. WEBSTER. The answer is objected to for the following reasons: —

Because it relates to matters not within the scope of the order for taking of evidence before the examiner.

Because the answer relates in no wise to any of the matters presented by the petitioner before the examiner.

Because the answer relates to matters not involved in the issues in this cause.

Because the answer relates to patents and mechanisms of patents not issued prior to the filing of the petition herein.

Because the answer relates to alleged pending applications and to the mechanisms of such applications.

And for the reasons aforesaid the answer is objected to as incompetent, inadmissible and irrelevant.

Int. 128. Have you collected under one or more separate covers the patents referred to by you in your last answer?

Ans. I have collected these patents in three volumes, which I now produce.

[*These three volumes are offered in evidence by the defendant, as Defendants' Exhibits, patents mentioned in Mr. Howard's deposition regarding machines on the list put in evidence, which have not been specifically discussed by him in his previous testimony, and the volumes being marked, respectively, "I", "II" and "III". Volume I is now marked "Defendants' Exhibit 198", Volume II is now marked "Defendants' Exhibit 199", and Volume III is now marked "Defendants' Exhibit 200".*]

Mr. WEBSTER. The introduction of the exhibits now offered in evidence is objected to because they relate to matters in no wise presented before the examiner by the petitioner.

Because the exhibits contain patents issued after the filing of the petition herein.

And because the patents comprising the three exhibits relate to matters in no manner involved in the issues in this cause.

Int. 129. Will you please state the number, date and name of patentee of the several Letters Patent contained in the three volumes which have just been offered in evidence as Defendants' Exhibits 198, 199 and 200?

Ans. DEFENDANTS' EXHIBIT 198.

Patent No. 447,681, March 3, 1891, Hamm.
Patent No. 460,526, September 29, 1891, Edgerly.
Patent No. 490,621, January 24, 1893, Goddu.
Patent No. 490,625, January 24, 1893, Goddu.
Patent No. 509,576, November 28, 1893, Gordon.
Patent No. 539,835, May 28, 1895, Tirrell.
Patent No. 555,314, February 25, 1896, Flint.
Patent No. 565,073, August 4, 1896, Goddu.
Patent No. 568,248, September 22, 1896, Goddu.
Patent No. 571,227, November 10, 1896, Hamm and Eaton.
Patent No. 576,114, February 2, 1897, Hadaway.
Patent No. 579,870, March 30, 1897, Hartford.
Patent No. 582,579, May 11, 1897, Cutter.
Patent No. 584,597, June 15, 1897, Mower.

Patent No. 591,658, October 12, 1897, Robinson.
Patent No. 594,810, November 30, 1897, Ryan.
Patent No. 603,023, April 26, 1898, Field.
Patent No. 609,518, August 23, 1898, Mayo.
Reissue patent No. 11,770, September 5, 1899, Mayo (reissue of 609,518).
Patent No. 611,405, September 27, 1898, Casgrain.
Patent No. 611,990, October 4, 1898, Casgrain.
Patent No. 613,228, November 1, 1898, Barbour.
Patent No. 623,306, April 18, 1899, Coupal and Gordon.
Patent No. 623,872, April 25, 1899, Booth.
Patent No. 624,426, May 2, 1899, Booth.
Patent No. 627,122, June 20, 1899, Keighley.
Patent No. 632,990, September 12, 1899, Dunham.
Patent No. 635,772, October 31, 1899, Hadaway.
Patent No. 638,010, November 28, 1899, Hadaway.
Patent No. 638,994, December 12, 1899, Smith.
Patent No. 640,426, January 2, 1900, Stanbon.
Patent No. 650,349, May 22, 1900, Bayley.
Patent No. 669,022, February 26, 1901, Casgrain.
Patent No. 669,023, February 26, 1901, Casgrain.
Patent No. 669,025, F ɔruary 26, 1901, Casgrain.

Patent No. 1,063,795, June 3, 1913, Hill (application filed November 12, 1912).

Patent No. 1,063,880, June 3, 1913, Hill (application filed February 10, 1912).

Patent No. 1,066,473, July 8, 1913, Davenport (application filed October 10, 1910).

Int. 130. Did the United Shoe Machinery Company, between 1899 and the filing of the petition in this case, and does it now, furnish shoe manufacturers machines not referred to by you in the list which you have heretofore given which are the subjects-matter of Letters Patent?

Mr. WEBSTER. Question objected to in so far as it calls for matters relating to what the defendant has done since the filing of the petition herein.

Ans. Yes, sir; a large number during the period between 1899 and the filing of the petition in this case, and since that time; and during the entire period since February, 1899, new machines have been coming along all the time.

Mr. WEBSTER. Answer objected to in so far as it relates to anything occurring since the date of the filing of the petition herein.

Int. 131. You have been questioned with regard to many machines put out by the United Shoe Machinery Company for performing a large number of different and successive operations in the manufacture of shoes. State generally whether and to what extent, if any, the efficiency of the operation of one of these machines in the manufacture of shoes depends on the efficiency of the operation of any of the others in their work on the same shoe, giving such specific illustrations as occur to you.

Mr. WEBSTER. Question objected to for that it calls for matter not within the scope of the order for the taking of testimony before the examiner.

Ans. The manufacture of shoes is unique in that a great number of different successive operations are performed by different machines upon the shoe and its several parts. It is essential for the success of the operation of each machine that the shoe come to that machine in the right condition for its operation, and that requires that the operations of machines which have previously been used upon the shoe shall have been performed properly. If such prior operations have not been properly performed, the work of that machine cannot be done right. On the other hand, proper

performance of subsequent operations upon the shoe requires that each machine in turn shall efficiently prepare the shoe for the operation of the next machine to which the shoe is to be presented; and improper operation of any machine in the line may impair the efficiency of the operation of one or many of the machines which are to perform subsequent steps in the manufacture of the shoe. Frequently the combined effects of improper operations of a number of machines will accumulate as the shoe goes through the factory and will result in a poorly made shoe. It quite often happens that when the finished shoe is not right it requires some time to find out what machine is responsible, and frequently it will be found that the poor work is the combined effect of impaired efficiency of several machines which operate successively upon the shoe. It is therefore of the utmost importance that every machine shall be designed with a view to the succeeding machines, and so that it will deal accurately and efficiently with the precise shoe organization that comes to it from the preceding machines; and every machine must be kept in its most efficient and satisfactory condition. That requires incessant and careful supervision of the machines all along the line.

Moreover, it is of great importance that each machine in the line be properly constructed from a mechanical standpoint. If a machine is poorly constructed, for example if some of the operating parts are weak, or if some of the movements given to any of the parts are too abrupt, or if the mechanical organization is not good, so that excessive wear and lost motion with consequent erratic operation results, a machine will frequently be put out of operation by breakage of parts or by necessity for adjustment to make the parts co-operate as they must to perform the machine's work. Every time a machine is put out of operation for any reason, shoes accumulate in front of that machine and there are no shoes for the operation of the machines for performing subsequent steps, so that those succeeding machines and their operators are idle and the whole factory suffers on account of that one disabled machine.

One of the machines which is put at a disadvantage in performing its operations, if prior machine operations on the shoe have

not been satisfactorily performed, is the lasting machine. The lasting machine cannot do its work properly if the operation of the assembling machine was not properly performed. The assembling machine, as explained in my previous testimony, establishes the proper relations of the parts of the shoe at its rear end, and secures them in that relation, the operation of the machine at the rear end of the shoe being illustrated in Defendants' Exhibits 177 and 178.

If one of those parts of the shoe is improperly located by the assembling machine, either the shoe will not be properly lasted or if the lasting machine operator detects the improper results of the assembling machine operation he must take time to remedy its bad work as best he can. A characteristic of the operation of assembling machine, Rex, is that it so performs the assembling operation that the ends of the counter are not forced below the insole, which, unless the machine were especially designed so to operate as to prevent it, would usually occur when the machine forced the rear end of the counter against the end of the insole. If the assembling machine failed to hold up the counter ends, the lasting machine operator would be obliged to reach down between the upper and the lining for the counter ends and pull them up into proper position before he could last the heel end of the shoe.

The success of the operation of the lasting machine is further dependent on the proper operation of the pulling-over machine. If the tip-seam or the lacing slit had not been located right in the operation of the pulling-over machine, as explained in my previous testimony, either the shoe will be lasted with the tip-seam or the lacing slit, or both, improperly located, resulting in a damaged shoe, or at great inconvenience and with loss of time the lasting machine operator must attempt to remedy by hand work the poor work of the pulling-over machine. Again, even if the pulling-over machine does properly locate the tip-seam and the lacing slit, such proper locations may be disturbed during the operation of the lasting machine if the pulling-over machine has not properly stretched the upper; and further, in the shaping of uppers to high-toed lasts, such as have been largely used for the last seven or eight years and are illustrated in Defendants' Exhibit 135 and in

the lasts on which the shoes of Defendants' Exhibits 177 and 180 were lasted, the stretching across the low part behind the high toe must be done chiefly on the pulling-over machine, and if that portion of the upper is not properly stretched in the operation of the pulling-over machine, the improper work of that machine can be remedied during the operation of the lasting machine only with great difficulty, if at all.

Not only is the lasting machine at a disadvantage if the operations of machines previously used on the shoe were not properly performed, but in turn if the operation of the lasting machine is not right the machines which are used subsequently upon the shoe cannot operate efficiently. It is essential to the proper operation of the welt-sewing machine that in the lasting operation the upper be forced into the angle between the channel lip and the feather edge of the insole and closely against the lip, and be secured in that position. If the lasting machine fails to get the upper into that position, the operation of the welt-sewing machine cannot be performed properly and the inseam cannot be made right. The reasons why such improper operation of the lasting machine would prevent effective operation of the welt-sewing machine will be explained later, in discussing the welt-sewing machine. The difficulties in getting the upper into satisfactory lasted position around the toes of modern lasts have been explained in the latter part of that portion of my previous testimony in regard to lasting machine, Chase, and in the earlier part of that portion of my previous testimony relating to lasting machine No. 5. It should be added that unsatisfactory operation of the welt-sewing machine may also be caused by failure of the lasting machine to seat the upper materials properly against the insole channel lip in the rear portion of the shank. The shapes of modern lasts as illustrated in Defendants' Exhibits 136, 137 and 142, have made it difficult for the lasting machine to force the upper materials, including the counter, into proper lasted position on the inside of the shoe in the shank unless the machine is especially adapted for that work.

Poor lasting of a turn shoe also makes the welt and turn sewing machine operate inefficiently in attaching the soles of turned shoes.

As fully explained in my previous testimony in regard to hand-method lasting machines for turned shoes, if the feather edge of the turn sole is curled up during the lasting operation, the needle of the welt and turn sewing machine will frequently strike the curled up feather edge and deface it or spoil it, so that a new sole must be substituted. It is therefore essential to satisfactory and effective operation of the welt and turn sewing machine on turn shoes that the lasting operation be properly performed. The problem of lasting the toes of turned shoes, so as to prepare them properly for the operation of the welt and turn sewing machine, was so serious that, as explained in my previous testimony, the United Company produced a machine particularly designed and exclusively adapted for that work, known as "Lasting Machine, Consolidated Hand Method (Turn Toe)."

Improper lasting on the inside of the shank of a shoe also puts the heel-attaching machine at a disadvantage in the subsequent heel-attaching operation. In that operation on several types of machines the shoe is positioned relatively to the heel by a "band clamp" which embraces the rear end of the shoe. If the counter on the inside is not forced properly against the sides of the last, the band clamp, engaging the ends of the counter, will displace the shoe to one side, so that the heel will be improperly located on the shoe.

It has already been stated that the welt-sewing machine cannot attach the welt and upper to the insole properly if the lasting machine in its operation has failed to force the upper snugly against the insole lip close to the feather edge of the insole, and that there is danger of such poor lasting as will prevent the proper operation of the welt and sewing machine around the toe or at the rear end of the inseam in the shank. Poor lasting at either of these points causes inefficient operation of the welt-sewing machine because the welt-sewing machine cannot make a tight inseam as is required for good shoe making. When the shoe is improperly lasted at these points the welt-sewing machine will either "sew high",— that is, the needle will enter the upper edge portion of the lip at points removed from the feather edge,— or the machine will "sew wide",

that is, while the needle will enter the angle at the base of the lip as it should, it will enter the upper at a point substantially removed from the base of the lip, and the result will be a loose seam. If the machine "sews high", there will be a loose connection of the upper and welt to the insole, there will be an objectionable wide space between the upper and welt of the finished shoe and the inseam stitches will show around the toe; and, further, there is danger that the welt and upper will break away from the insole in the wear of the shoe. If the welting machine "sews wide", the inseam will be loose and there is danger that the thread will break, and that the shoe will come to pieces.

If the upper-trimming machine, which removes the bunch of excess upper material at the toe which is left after the lasting operation, as shown in Defendants' Exhibits No. 8 and No. 149, does not do its work right, and fails to remove some of the stock, that stock may get in the way of the thread arm or looper of the welt-sewing machine and cause that machine to miss stitches, and it will also make it difficult for the operator to present the shoe in right position for the operation of the welt-sewing machine.

The operation of the tack-pulling machine which pulls the lasting tacks, illustrated in Defendants' Exhibit No. 149, must also be properly performed, because if that machine breaks off some of the lasting tacks those tacks will frequently be struck by the welter needle, causing the needle to damage the stock, as by tearing away a portion of the channel lip, as well as breaking the needle, resulting in considerable expense and loss of the operator's time in replacing needles in the machine and in repairing damaged work.

It has been explained how inefficient operation of the lasting machine will make the welt-sewing machine operate improperly by sewing wide, so that the "welt crease", or the angle formed by the welt and upper, will be displaced outwardly away from the insole lip. This inefficient operation of the lasting machine causing, and followed by, improper operation of the welt-sewing machine, also causes bad results in the operations of the rounding and channeling machine and the out-sole stitching machine. A rounding and channeling machine is so organized that errors in the

location of the inseam by the welting machine are reproduced in the shaping of the sole and the cutting of the channel on the rounding and channeling machine.

The out-sole stitching machine is caused to operate inefficiently in attaching the out-sole to the welt by improper operation of the lasting machine, of the welt-sewing machine, or of the rounding and channeling machine. If the lasting machine fails to push the upper materials snugly against the channel lip so that the welting machine "sews wide", the needle of the out-sole stitcher will usually cut into the inseam in the shank. This frequently results in the cutting of the inseam and sometimes in the breaking of both the inseam and the outseam so that the shoe will come apart in its wear. If the welting machine "sews high", that is, if the inseam is near the top of the channel lip instead of at its base, the out-sole stitching machine will, in this operation, pull the welt away from the upper so that the inseam stitches will be exposed in the finished shoe. Also if a wide inseam has caused the rounding and channeling machine to shape and channel the sole improperly, the outseam will not be properly located. Further, if the channeling knife on the rounding and channeling machine should not be adjusted for correct operation of that machine on the shank of the sole, the out-sole stitching machine could not operate right, because if the channel were too far from the edge, the out-sole stitcher would cut into the inseam with results similar to those already explained as resulting from too wide an inseam made by the welter, while if the rounding and channeling machine cuts the channel too near the edge of the out-sole in the shank, the needle and the awl holder of the out-sole stitcher would, in its operation in the shank, strike and damage the upper.

The heel-attaching machine is put at a disadvantage, as already explained, by improper lasting on the inside of the shank of a shoe. In the heel-attaching operation on several types of machine the heel is held in predetermined position by the heel holder, and the shoe is positioned relatively to the heel by a "band clamp" which embraces the rear end of the shoe and engages the upper adjacent to the ends of the counter. If the counter is not forced against the

last on the inside of the shoe in the lasting operation, the "band clamp" which occupies a predetermined relation to the heel holder displaces the shoe to one side with relation to the heel, so that the heel is not properly located on the shoe in the heel-attaching operation. The heel-attaching machine may further be prejudiced by inefficient operation of the lasting machine if the counter is forced in further over the insole on one side than the other, which is likely to happen on a lasting machine not adapted for proper operation on modern crooked lasts. The portion of the counter which should be lasted over the insole is skived and is thinner than the body of the counter, and if a portion of the body of the counter is forced over on the insole on one side during the lasting operation it makes the stock thicker on that side than on the other side; consequently, when the heel is attached it will be tilted to one side by the extra thickness on one side of the shoe.

The impairment of the efficiency of the operation of one machine by the failure of machines which have previously operated upon the shoe to do their work right extends all the way through the long line of machines which operate successively upon the shoe, and includes even those machines which perform minor operations. The difficulties which I have specifically discussed are merely illustrations of what may occur throughout the factory.

Mr. WEBSTER. The answer is objected to as largely argumentative and as having reference to matters outside the scope of the order referring the taking of evidence to the examiner, and because it relates to matters in no wise involved or at issue in this cause; and for the reasons aforesaid the answer is objected to as incompetent, inadmissible and irrelevant.

Int. 132. In your previous testimony in regard to a number of machines you stated that such machines performed operations which were performed by hand in 1899. Please state, if you know, how many machines now being supplied to shoe manufacturers by the United Shoe Machinery Company perform operations which were performed by hand in 1899. State also when each of such machines, if any, were first put out by the United Company.

Mr. WEBSTER. The question is objected to as calling for matter

not within the scope of the order referring the taking of testimony to the examiner, and because of calling for matter having no reference to the questions involved in this cause.

Ans. The United Company is putting out many machines which perform operations that were performed by hand in 1899 or were not performed at all in 1899, either by hand or by machine. On a list which I have before me I have enumerated thirty-nine such machines; but there are very likely more which I did not recall as I prepared this list. The machines on this list, all of which are patented or are subjects-matter of pending applications, are as follows: —

MACHINES PUT OUT BY UNITED SHOE MACHINERY COMPANY WHICH DO WORK ALWAYS DONE BY HAND IN 1899 OR NOT DONE AT ALL, EITHER BY HAND OR BY MACHINE, IN 1899.

Name of Machine.	Department.	First put out by United Shoe Machinery Company.
Assembling Machine: Rex	Pulling Over Department	September, 1904
Beating and Slashing Machine: Goodyear Welt	Goodyear Department	November, 1904
Beveling Machine: Goodyear Underwedge	Goodyear Department	Early in 1911
Blacking Machine: Crest Heel	General Department	September, 1908
Buffing Machine: Velvet Box Toe	Heeling Department	January, 1904
Clicking Machine: Ideal	General Department	March, 1908
Clinch Machine: Universal Double	Metallic Department	November, 1899
Eyeletting Machine: Duplex [first machine to set two eyelets on opposite sides of an upper simultaneously]	Eyeletting Department	July, 1902

Embossing Machine: Goodyear Heel	Goodyear Department	1910
Gumming Machine: Rex Toe [superseded by Shellacing Machine: Rex Box Toe]	Pulling Over Department	October, 1904
Jointing Machine: Goodyear	Goodyear Department	November, 1910
Lacing Machine: Ensign	Fitting Room Department	February, 1906
Lasting Machine: Consolidated Hand Method (Turn Heel Seat)	Lasting Department	April, 1906
Lasting Machine: Consolidated Hand Method (Turn Toe)	Lasting Department	April, 1906
Lasting Machine: Staple	Lasting Department	1912
Molding Machine: Stitch-down Upper	General Department	November, 1907
Nailing Machine: Alpha Wood Heel	Heeling Department	September, 1907
Pounding Machine: Rex [superseded by Pounding Machine, Model E, Rex]	Pulling Over Department	1904
Pincer: U S M C Bench	General Department	August, 1911
Pounding and Beating Up Machine — Model A: Rex Rotary	Pulling Over Department	March, 1912
Pulling Machine: Goodyear Insole Tack	Goodyear Department	February, 1909
Pulling-Over Machine: Rex	Pulling Over Department	September, 1899 [Experimental]
Pulling-Over Machine Model B: Rex [Pulling Over and Lasting Turn Shoes]	Pulling Over Department	July, 1910

Pulling and Resetting Machine: Goodyear Tack	Goodyear Department	November, 1910
Pulling and Trimming Machine: Insole Tack and Turn Shoe	Goodyear Department	December, 1911
Recessing Machine: Goodyear Underwedge	Goodyear Department	1910
Reducing Machine: Goodyear Out-sole Channel Shank	Goodyear Department	April, 1909
Repairing Machine: Patent leather	General Department	August, 1911
Skiving Machine: Eros Rand	Heeling Department	August, 1906
Skiving Machine: Goodyear Shank Welt	Goodyear Department	January, 1904
Softening Machine: Toe	General Department	August, 1911
Stapling Machine: Goodyear Upper	Goodyear Department	October, 1910
Stitching Machine: Economy Insole	Goodyear Department	October, 1909
Trimming Machine: Goodyear Insole Heel Seat	Goodyear Department	January, 1911
Trimming Machine: Rex Toe [superseded by Pounding and Trimming machine, Rex Rotary]	Pulling Over Department	October, 1904
Trimming Machine: Rex Upper	Pulling Over Department	December, 1905
Turning Machine: Goodyear Forepart	Goodyear Department	April, 1901
Turning Machine: Goodyear Heel	Goodyear Department	April, 1901

Turning Machine: Good-
year Welt Edge Goodyear Department December, 1909.

Mr. WEBSTER. The answer is objected to because it relates to matters not within the scope of the order of reference to the examiner, and because it relates to matters not in reply to, or in defence of, any evidence presented by the petitioner and because it relates to a considerable extent to matters and things not limited by the date of the filing of the petition herein; and for the reasons aforesaid the answer is objected to as incompetent, inadmissible and immaterial.

[*Adjourned to Tuesday, October 28, 1913, at 10* A. M.]

BOSTON, MASS., October 28, 1913.

Mr. PHILLIPS. I desire to state that the witness desires to call attention to certain clerical errors in the printed record of his testimony as taken in open court, and to inquire if there is any objection on the part of counsel for the Government to his calling attention to the errors at this time.

Mr. WEBSTER. Counsel for the Government states that he sees no objection to Mr. Howard's calling attention at this time to the clerical errors referred to.

The WITNESS. In the middle of page 481, fourth line from the end of the answer to interrogatory 46, the words "a fine" should be stricken out.

Page 483, in the fifth line of the answer to interrogatory 55, the comma and dash before "fore-part" should be cancelled and "and" should be inserted.

Page 485, in the first line the first word of the answer should be "A" instead of "The". In the sixth line "to be" should be canceled and "being" substituted. In the fifteenth line cancel "possibly" and substitute "and". In the seventeenth line before "nails" insert "heel attaching".

Page 489, the paragraph beginning in the second line is a duplication of a matter contained in a paragraph at the top of page 485. It is out of place on page 489 and should be canceled. On the same page, in line nine of the answer to interrogatory 82, the sec-

ond word, "heel", should be canceled and "sole" should be substituted.

Page 491, third line, instead of "A standard screw machine is a screw", it should be "A standard screw machine is a machine".

Page 529, in the second and third lines of the answer to interrogatory 260, the expression "in this branch of its business" is surplusage and, to secure clarity, should be canceled.

On page 539, in the fifth line of the answer to interrogatory 301, "for" should be "after".

On page 542, in the seventh line of the answer to interrogatory 316, the word "being" should be "performing".

On page 543, in the third line of the answer to interrogatory 320, "clogging" should be canceled and "crowding" should be substituted.

On page 546, in the fourth line of the answer to interrogatory 332, "fast" should be "fair".

On page 561, it is clear that in the sentence "Mr. Choate. And the awl on the metallic machine makes a straight hole for the needle?" should read: "And the awl on the metallic machine makes a straight hole for the nail?" That is, the word "nail" should be substituted for the word "needle".

On page 562, in the third line of the answer to interrogatory 404, "fresh" should be changed to "flesh".

On page 563, in the third line of the answer to interrogatory 406, "slit" should be "slip". On the same page, in the middle of the page, the sentence "This was a machine usable with the operation with the Gem insole" should read: "This was a machine useful only in preparing the Gem insole."

On page 570, in the fourth line, "that counter" should read "the counter".

On page 574, in the last line, the first word should be "tool" instead of "heel".

On page 575, in the fourth and fifth lines to the answer to interrogatory 441, "patented" should be "intended".

In the seventh line of that answer, in the first line of interrogatory 444, in the answer to interrogatory 444, and in two instances

in the second line of the answer to interrogatory 445, "beating" should be "beading".

On page 581, in the fourth line of the answer to interrogatory 472, "in" should be "on". The same page, in the second line of the answer to interrogatory 474, the word "Emerson" should be "Amazeen".

On page 582, in the third line of the answer to interrogatory 481, "to" after "on" should be canceled.

On page 583, in the second line, before the word "loose" the word "the" should be changed to "a".

On page 586, in the third line of answer to interrogatory 500, a comma and "a" should be inserted after "sole".

On page 595, in the eighth line of the first paragraph, "the" before "heel" should be "a". In the middle of the page, in the fourth and fifth lines of the answer to interrogatory 518, clearness will be secured if the surplus expression "as the shoes had been made before the sole had been sewed" be canceled.

On page 615, in the first line of the answer to cross-interrogatory 622, "two devices" should be "best features".

On page 649, in the first line of the answer to cross-interrogatory 674, a period should be inserted after the word "agency", the following "of" should be canceled, and the next word "all" should begin with a capital. In the next line the word "that" should be canceled.

On page 651, in answer to cross-interrogatory 693, in the fifth and seventh lines thereof, the word "twirl" should be "whirl".

On page 652, in the second line of the answer to cross-interrogatory 696, the word "round" should be "room".

On page 654, the last word in the last line of the answer to cross-interrogatory 714 should be "stitches" instead of "stickers".

On page 667, in the answer to cross-interrogatory 806, the second word "it" should be canceled.

On page 682, in the ninth line of the answer to cross-interrogatory 895, the fifth word should be "used" instead of "done".

On page 706, in the ninth line of the answer to cross-interrogatory 1101, the third word should be "were" instead of "is".

On page 712, in the fifth line of the answer to cross-interrogatory 1151, the word "core" should be "cone".

Mr. PHILLIPS. Counsel for defendants inquires whether or not counsel for petitioner will agree that the printed record may be corrected, so far as practicable, in accordance with the statement just given by the witness.

Mr. WEBSTER. I see no objection in the interest of fairness, why the corrections should not be made.

Mr. PHILLIPS. So far as I am at present advised, this closes my direct examination of this witness, and the witness is offered to counsel for petitioner for cross-examination.

Cross Examination by ALLEN WEBSTER, Esq., *of Counsel for Defendants.*

Cross-Int. 133. Mr. Howard, as I understand your previous testimony you have had fifteen years' experience as attorney for the United Company and its predecessor, the McKay Shoe Machinery Company, and that during that time you have given substantially all of your time to an investigation of the art with reference to which you have testified, and have thus become perfectly familiar with the whole art. Am I right in my understanding?

Ans. I should not be willing to say that I had devoted all of my time to investigation of the art and certainly could not say that I have become "perfectly familiar with the whole art". My work has required a great deal of investigation of the art, and I believe that I have acquired a considerable familiarity with patents relating to the manufacture of shoes.

Cross-Int. 134. You say, in answer to question 1, among other things, that you spent a considerable portion of your time in connection with litigation involving shoe machines and shoe machinery patents. Will you kindly state on the record the names of the various cases you refer to in that portion of your answer?

Ans. Among the suits to which I had reference in my answer were a number brought by the Goodyear Shoe Machinery Company against the Eppler Welt Machine Company and, at least, one suit brought by one of the lasting machine companies, I think it was

the McKay & Copeland Lasting Machine Company, against the Goodyear Shoe Machinery Company. Before I left the firm of Fish, Richardson & Storrow, as it was then known, to become connected with the McKay Shoe Machinery Company, I was also engaged on work connected with the proposed infringement suits which the McKay Shoe Machinery Company was proposing to bring, in the name of the trustees of the McKay Metallic Fastening Association, against Louis Goddu, the Goddu sons and the Goddu Sons Metal Fastening Company.

Cross-Int. 135. Were any of the cases with which you were connected involving shoe machinery patents entered in court? And if so, kindly give the names of the cases, if it is possible for you to do so.

Mr. FISH. You mean at this time?

Mr. WEBSTER. Were they ever entered?

Mr. FISH. Are you talking about the time that he was connected with my firm, or since?

Mr. WEBSTER. Any time.

Ans. As regards the suits to which I referred in my answer to the preceding interrogatory, all of the suits were pending in court except the proposed suit to which I referred against the Goddus and the Goddu Sons Metal Fastening Company. I have not at hand the numbers of the suits, although I should be glad to obtain them if desired.

As regards suits on shoe machinery patents upon which I have been engaged during the period since I first became connected with the McKay Shoe Machinery Company in September, 1898, to the present time, there have been a great many of such suits which have been entered in court and in many of which final decrees have been entered. I have not at hand the data of such suits, although I shall be glad to furnish them if desired.

Cross-Int. 136. Can you at the present time give the number, date, title and name of patentee of the patents involved in the litigation referred to by you?

Mr. PHILLIPS. The question is objected to as not pertinent to anything referred to in the direct examination of this witness.

Mr. WEBSTER. Counsel for petitioner respectfully calls attention to the fact that the question goes to the qualification of the witness, also to patents which counsel understands have been referred to in the testimony of the witness.

Ans. Among over a hundred patents that have been involved in the litigation with which I have been connected are the following: —

No. 776,823, December 6, 1904, Allen, heel-compressing machine.

No. 530,046, November 27, 1894, Heys, heel-compressing machine.

No. 776,787, December 6, 1904, Leland, heel-compressing machine.

No. 946,591, January 18, 1910, Arnold, sewing machine.

No. 961,200, June 4, 1910, Ashton, vamp-trimming machine.

No. 921,503, May 11, 1909, Bates, machine for cutting out thin sheet material such as upper leather for boots and shoes.

No. 950,986, March 1, 1910, Bates, press.

No. 1,000,957, August 15, 1911, Bates, machine for inserting nails in heels.

No. 461,793, October 20, 1891, Briggs, method of forming chain stitches.

No. 463,982, November 24, 1891, Briggs, rough rounding and channeling machine.

No. 511,263, December 19, 1893, Briggs and Dancel, rough rounding and channeling machine.

No. 601,933, April 5, 1898, Brock, lasting machine.

No. 601,934, April 5, 1898, Brock, lasting machine.

No. 765,650, July 19, 1904, Casgrain, reel.

No. 364,217, June 7, 1887, Coburn, mold for molding heels.

No. 582,579, May 11, 1897, Cutter, nailing machine.

No. 563,471, July 7, 1896, French and Meyer, sole sewing machine.

No. 600,883, March 22, 1898, French and Meyer, sole channeling and trimming machine.

No. 630,339, August 8, 1899, sole trimming and channeling machine.

No. 552,834, January 7, 1896, Grandy, power lasting machine.

No. 725,077, April 14, 1903, Hadaway, welting for welt shoes.

No. 864,532, August 27, 1907, Hadaway, machine for preparing shoes for sewing.

No. 963,761, July 12, 1910, Hadaway, sole-sewing machine.

No. 968,555, August 30, 1910, Hadaway, vamp-trimming machine.

No. 627,122, June 20, 1899, Keighley, sole-molding machine.

No. 524,446, August 14, 1894, Lombard, lasting machine.

No. 675,783, June 4, 1901, Meloon, guide for shoe-sewing machine.

No. 596,305, December 28, 1897, Pettingill, last support.

No. 884,524, April 14, 1908, Pope, heel-attaching machine.

No. 561,608, June 9, 1896, Raymond, heel-attaching machine.

No. 619,707, February 14, 1899, Raymond, heel-attaching machine.

No. 591,698, October 12, 1897, Robinson, nailing machine.

No. 781,236, January 31, 1905, Small, top-lifts.

No. 548,671, October 29, 1895, Stirckler, lasting machine.

No. 834,085, October 23, 1906, Taylor, heels for boots and shoes.

No. 982,550, January 24, 1911, Towle, heel-nailing machines.

No. 700,279, May 20, 1902, Winkley, welt-sewing machine.

Cross-Int. 137. Have you now the data with reference to the litigation with which you were connected; and, if so, will you kindly state what cases you were engaged in involving shoe machinery, giving the name of the case and where the same was entered, that is, in what circuit?

Mr. PHILLIPS. Objected to as improper cross-examination and as having no bearing on the matter touched upon in the direct examination of this witness.

Ans. Among the several hundred suits on patents relating to shoe machinery, with which suits I have been familiar and in connection with which I have done considerable work, are the following: —

United Shoe Machinery Company *v.* W. J. Young Machinery Company et al., Equity No. 2118 (27), District of Massachusetts.

United Shoe Machinery Company *v.* Charles W. Bowen, Equity No. 2120 (29), District of Massachusetts.

United Shoe Machinery Company *v.* Peter J. Carroll, Equity No. 2119 (28), District of Massachusetts.

United Shoe Machinery Company *v.* Charles E. Greenman, Equity No. 2051, District of Massachusetts.

United Shoe Machinery Company *v.* Duplessis Independent Shoe Machinery Company, Equity No. 2050, District of Massachusetts.

United Shoe Machinery Company *v.* Thomas G. Plant, Equity No. 775, District of Massachusetts.

United Shoe Machinery Company *v.* Thomas G. Plant Company, Equity No. 208 (old No. 774), District of Massachusetts.

United Shoe Machinery Company *v.* George H. Snow, Equity No. 311, District of Massachusetts.

United Shoe Machinery Company *v.* George H. Snow Company, Equity No. 795 (220), District of Massachusetts.

United Shoe Machinery Company *v.* Thomas G. Plant, Equity No. 766, District of Massachusetts.

United Shoe Machinery Company *v.* Thomas G. Plant Company, Equity No. 767, District of Massachusetts.

United Shoe Machinery Company *v.* E. M. Chesley and William A. Rugg, Equity No. 884 (227), District of Massachusetts.

United Shoe Machinery Company *v.* James M. Caunt, Equity No. 1939, District of Massachusetts.

United Shoe Machinery Company *v.* Harry R. Emery, Equity No. 2006, District of Massachusetts.

United Shoe Machinery Company *v.* Fred J. Thompson, Equity No. 2045, District of Massachusetts.

Consolidated & McKay Lasting Machine Company *v.* Carver Cotton Gin Company, Equity No. 1156, District of Massachusetts.

Consolidated & McKay Lasting Machine Company *v.* Busell Lasting Machine Company, Equity No. 1253, District of Massachusetts.

Consolidated & McKay Lasting Machine Company *v.* Michael Sheehy et al., Equity No. 1251, District of Massachusetts.

Consolidated & McKay Lasting Machine Company *v.* Ezra H. Stetson et al., Equity No. 1254, District of Massachusetts.

Consolidated & McKay Lasting Machine Company *v.* Frank H. Torrey, Equity No. 1255, District of Massachusetts.

Consolidated & McKay Lasting Machine Company *v.* Patrick J. Harney, Equity No. 1252, District of Massachusetts.

Consolidated & McKay Lasting Machine Company *v.* Seaver Process Lasting Company et al., Equity No. 1167, District of Massachusetts.

United Shoe Machinery Company *v.* C. E. Greenman, Equity No. 1994 (158), District of Massachusetts.

United Shoe Machinery Company *v.* E. Bottomley, Equity No. 2007, (168), (148), District of Massachusetts.

United Shoe Machinery Company *v.* Duplessis Independent Shoe Machinery Company, Ltd., et al., Equity No. 1993 (157), (141), District of Massachusetts.

United Shoe Machinery Company *v.* George B. Leavitt, Equity No. 2008 (169), (149), District of Massachusetts.

United Shoe Machinery Company *v.* H. E. Lewis, Equity No. 2004 (166), (146), District of Massachusetts.

United Shoe Machinery Company *v.* The Wentworth Company, Equity No. (blank), Southern District of Ohio.

United Shoe Machinery Company *v.* George M. Greene et al., Equity No. 1341, District of Massachusetts.

United Shoe Machinery Company *v.* Thomas G. Plant, Equity No. 768, District of Massachusetts.

United Shoe Machinery Company *v.* Thomas G. Plant Company, Equity No. 769, District of Massachusetts.

Goodyear Shoe Machinery Company *v.* Thomas D. Barry et al., Equity No. 1348, District of Massachusetts.

United Shoe Machinery Company *v.* Duplessis Shoe Machinery Company, Equity No. 2077 (300), District of Massachusetts.

United Shoe Machinery Company *v.* E. M. Chesley and William A. Rugg, Equity No. 370, District of Massachusetts.

United Shoe Machinery Company et al. *v.* Charles E. Greenman, Equity No. 1974, District of Massachusetts.

United Shoe Machinery Company *v.* Duplessis Independent Shoe Machinery Company, Ltd., et al., Equity No. 1973, District of Massachusetts.

United Shoe Machinery Company *v.* Thomas G. Plant, Equity No. 749, District of Massachusetts.

United Shoe Machinery Company *v.* Thomas G. Plant Company, Equity No. 750, District of Massachusetts.

United Shoe Machinery Company *v.* Thomas G. Plant Company, Equity No. 195 (old No. 755), District of Massachusetts.

United Shoe Machinery Company *v.* Charles H. Alden and C. H. Alden Company, Equity No. 413, District of Massachusetts.

United Shoe Machinery Company *v.* Moses N. Arnold and M. N. Arnold Company, Equity No. 412, District of Massachusetts.

United Shoe Machinery Company *v.* Thomas G. Plant, Equity No. 777, District of Massachusetts.

United Shoe Machinery Company *v.* Thomas G. Plant Company, Equity No. 209 (old No. 776), District of Massachusetts.

United Shoe Machinery Company *v.* George H. Snow Company, Equity No. 796 (221), District of Massachusetts.

United Shoe Machinery Company *v.* Bresnahan Shoe Machinery Company et al., Equity No. 1772, District of Massachusetts.

United Shoe Machinery Company *v.* Thomas G. Plant, Equity No. 764, District of Massachusetts.

United Shoe Machinery Company *v.* Thomas G. Plant Company, Equity No. 763, District of Massachusetts.

United Shoe Machinery Company *v.* The Duplessis Shoe Machinery Company, Ltd. and Richard H. Long, Equity No. 450 (65), District of Massachusetts.

United Shoe Machinery Company *v.* Long Shoe Manufacturing Company and Richard H. Long, Equity No. 429 (59), District of Massachusetts.

United Shoe Machinery Company *v.* Thomas G. Plant, Equity No. 751, District of Massachusetts.

United Shoe Machinery Company *v.* Thomas G. Plant Company, Equity No. 752, District of Massachusetts.

United Shoe Machinery Company *v.* E. M. Chesley and William A. Rugg, Equity No. 837, District of Massachusetts.

United Shoe Machinery Company *v.* N. W. Kimball et al., Equity No. 1723 (80), (76), District of Massachusetts.

United Shoe Machinery Company *v.* Charles S. Fuller and Fred P. Fuller (Cape Ann Shoe Company), Equity No. 1729 (83), (79), District of Massachusetts.

United Shoe Machinery Company *v.* Thomas G. Plant et al., Equity No. 1113, District of Massachusetts.

United Shoe Machinery Company *v.* N. W. Kimball et al., Equity No. 1688 (69), District of Massachusetts.

United Shoe Machinery Company *v.* J. H. Cross et al., Equity No. 1118, District of Massachusetts.

United Shoe Machinery Company *v.* M. F. Donovan, Equity No. 1119, District of Massachusetts.

United Shoe Machinery Company *v.* E. P. Faunce et al., Equity No. 1115, District of Massachusetts.

United Shoe Machinery Company *v.* R. C. Kellam et al., Equity No. 1114, District of Massachusetts.

United Shoe Machinery Company *v.* A. F. Smith, Equity No. 1116, District of Massachusetts.

United Shoe Machinery Company *v.* Aaron F. Smith et al., Equity No. 1124, District of Massachusetts.

United Shoe Machinery Company *v.* W. W. Williams, Equity No. 1121, District of Massachusetts.

United Shoe Machinery Company *v.* Woodward Manufacturing Company et al., Equity No. 1120, District of Massachusetts.

United Shoe Machinery Company *v.* Kimball, Equity No. (blank), District of New Hampshire.

United Shoe Machinery Company *v.* C. K. Fox, Equity No. 1692 (71), (17), District of Massachusetts.

United Shoe Machinery Company *v.* George W. Herrick, Equity No. 1117 (5), District of Massachusetts.

United Shoe Machinery Company *v.* J. E. Maguire et al., Equity No. 1684 (68), (16), District of Massachusetts.

United Shoe Machinery Company *v.* Duplessis Shoe Machinery Company, Equity No. 1975 (146), District of Massachusetts.

United Shoe Machinery Company *v.* C. E. Greenman, Equity No. 1976 (131), District of Massachusetts.

Consolidated & McKay Lasting Machine Company *v.* Seaver Process Lasting Company, Equity No. 1168, District of Massachusetts.

United Shoe Machinery Company *v.* Edward M. Chesley and William A. Rugg, Equity No. 836, District of Massachusetts.

United Shoe Machinery Company *v.* Thomas G. Plant Company, Equity No. 765, District of Massachusetts.

United Shoe Machinery Company *v.* Edward M. Chesley and William A. Rugg, Equity No. 833, District of Massachusetts.

United Shoe Machinery Company *v.* Thomas G. Plant, Equity No. 753, District of Massachusetts.

United Shoe Machinery Company *v.* Thomas G. Plant Company, Equity No. 194 (old No. 754), District of Massachusetts.

M. V. Bresnahan et al. *v.* United Shoe Machinery Company, Equity No. 362, District of Massachusetts.

Essex Machine Company *v.* O. A. Miller Treeing Machine Company, Equity No. 813, District of Massachusetts.

Cross-Int. 138. As I understand your testimony, you had full and complete charge of all the patent soliciting work of the McKay Shoe Machinery Company and later of the United Shoe Machinery Company; am I correct?

Ans. I had entire charge of the patent soliciting of the McKay Shoe Machinery Company, and since the formation of the United Shoe Machinery Company I have had entire charge and sole responsibility for the soliciting of patents relating to machines in all departments other than the Goodyear department. The soliciting of patents on machines in the Goodyear department has been done by the firm of Phillips, Van Everen & Fish under my general supervision.

Cross-Int. 139. So that in the course of your employment you became familiar with the art in all branches; is that correct?

Ans. That is substantially correct.

Cross-Int. 140. And does this include the development of the art with reference to inventions made by parties having no connection with either of your employers, or is it limited to the art as developed through applications by your employers or those interested with them?

Ans. The proper discharge of my duties has required that I keep advised of the general development of the art, including inventions made and patented by inventors not in any way connected with the United Shoe Machinery Company or with its predecessor, the McKay Shoe Machinery company.

Cross-Int. 141. In your direct testimony you read into the record a list of 149 machines in response to question 7. Do you wish to have it understood that you testified that all of the machines specified in that list are necessary for the successful manufacture of shoes?

Ans. I do not recall that I so testified.

Cross-Int. 142. Then they are not all necessary to the manufacture of shoes, are they?

Mr. PHILLIPS. The question is objected to as vague and ambiguous.

Ans. The machines on that list are all useful in or in connection with the manufacture of shoes. Some of them, of course, are particularly adapted for one type of shoe, as, for example, the welt shoe, the turn shoe, or the McKay sewed shoe; and frequently machines especially adapted for use in the manufacture of one type of shoe are not needed and have no place in the manufacture of other types of shoes.

Cross-Int. 143. Now, taking up first machines employed in the manufacture of what is known as the McKay shoe, will you kindly specify what types of machines are necessary for the bottoming of the McKay shoe by machinery?

Mr. PHILLIPS. Counsel for the defendants would like to have counsel for petitioner explain what he means by "types of machines".

Mr. WEBSTER. In view of the suggestion of counsel for defendants I will put the question in this way: —

Cross-Int. 144. In the bottoming of a McKay shoe by machinery, is anything more required than the employment of a lasting machine and a McKay sewing machine?

Mr. PHILLIPS. Your question is still ambiguous. Have you any objection to stating what you mean by "anything more"?

Mr. WEBSTER. By the term "anything more" I mean any other machinery.

Mr. PHILLIPS. As I understand the question proposed to the witness, it is stated as follows: "In the bottoming of a McKay shoe by machinery is any other machinery required than a lasting machine and a McKay sewing machine?"

Ans. A large number of machines in addition to lasting and McKay sewing machines are used by all manufacturers of McKay shoes in the bottoming room.

Cross-Int. 145. Is it not a fact that a considerable number of the 149 machines mentioned by you in answer to direct question 7 relate to the ornamentation or the finishing of shoes?

Mr. PHILLIPS. Question objected to as uncertain and ambiguous.

Ans. Some of the machines on the list referred to are used by manufacturers for rendering the shoes made by them marketable, both in the way of rendering the shoes presentable after their numerous handlings in the factory and in the way of rendering them attractive in appearance so that they will be salable and will be pleasing to the wearer.

Mr. WEBSTER. Answer objected to, because not responsive and evasive.

Cross-Int. 146. Do you wish the court to understand that you testify that the employment of a blacking or polishing machine adds in any way to the wearing quality of shoes?

Mr. PHILLIPS. Question objected to as referring to no machine enumerated in the list of machines submitted by the witness.

Ans. I did not intend to state, and think that I did not state, that the operation of any such machine adds to the wearing quality of the shoe.

Cross-Int. 147. Does the employment of a burnishing machine add to the wearing quality of a shoe?

Ans. I think not; but it adds materially to the salability of the shoe and to the satisfaction of the wearer of the shoe.

Mr. WEBSTER. All that portion of the answer following the words "I think not" is objected to as non-responsive, and the attention of the witness is respectfully directed to the fact that we are all desirous of shortening the record as much as possible and he is invited to assist by simply answering the questions and stopping.

Cross-Int. 148. Does the employment of a beading machine add in any way to the wearing quality of the shoe?

Ans. A beading machine is very useful in the manufacture of a shoe, and the work done by it would have to be done by hand at great expense if manufacturers did not have machines for performing the work done by beading machines.

Mr. WEBSTER. Answer objected to as being not responsive, evasive and argumentative, and counsel for petitioner moves that the answer be stricken from the record.

Cross-Int. 149. Will you now state whether, in your opinion, the employment of a beading machine in the manufacture of shoes adds in any wise to the wearing quality of the shoe?

Ans. I think that it does.

Cross-Int. 150. Now, explain how the employment of a beading machine adds to the wearing quality of a shoe.

Ans. Every machine which is used in the manufacture of the shoe, and does its work right, probably contributes something to the wear of the shoe. The beading machine, which is used after the upper and lining have been stitched together wrong side out, as is the universal practice, is used in the operation of turning upper and lining right side out and in flattening and setting the seam which unites the lining and upper. If that seam were not properly pressed out and flattened by the beading machine, it would not be as secure and there would be more danger of the seam ripping and the lining and upper coming apart.

Cross-Int. 151. I observe in your list of machines "clicking machine"; is it not a fact that this is employed for cutting out uppers only?

Ans. That machine is employed in the shoe industry exclusively for cutting out parts of uppers and linings for such parts.

Cross-Int. 152. I observe in your list three machines under the heading of "eyeletting machine"; is it not a fact that these are used only for setting eyelets in uppers?

Ans. Yes, sir; that is their only use in the shoe industry.

Cross-Int. 153. I also note "finishing machine, buttonhole"; does that relate to anything but buttonholes in shoe uppers?

Ans. No, sir, so far as the manufacture of shoes is concerned.

Cross-Int. 154. I observe in the list "indenting and burnishing machine"; does that relate to anything but ornamenting the shoe?

Ans. At the same time that the machine "ornaments" the upper it makes presentable the upper face of the welt, which, up to the time of its operation, presented a rough and unsightly appearance which would prevent its marketability except as a damaged shoe.

Cross-Int. 155. Then the machine referred to relates to finishing or ornamenting, does it not?

Ans. Yes, sir.

Cross-Int. 156. And does the "nurling machine" relate to anything more than ornamentation or finishing?

Ans. That is its chief use.

Cross-Int. 157. Is it not true that the "perforating machines" mentioned in the list are designed and adapted only for making ornamental operations?

Ans. Those machines are used with the purpose of adding to the salability of the shoe and the satisfaction of the wearer by imparting an attractive appearance to the shoe.

Cross-Int. 158. Is it not true also that "punching machine" and the "quilting machine" mentioned in the list relate to, and are designed only for, producing ornamentation? Kindly answer the question directly, if possible.

Ans. My answer immediately preceding will apply to the punching machine. The quilting machine is used for the purpose of increasing the wear of soles of shoes by inserting a large number of metal "slugs" in the bottoms of soles.

Cross-Int. 159. Is it not true that the "sanding machine" mentioned in the list is for finishing only?

Ans. No, sir.

Cross-Int. 159*a*. What is it for?

Ans. It is used to prepare box toes and counters in such manner that they will not injure the adjacent upper when they occupy their proper positions in the shoe.

Cross-Int. 160. Then it is used for the purpose of smoothing, is it?

Mr. PHILLIPS. Question objected to, as the witness has already stated what the function of a sanding machine is.

Ans. In the operation of the machine, after it has removed rough portions of counters or box toes which might injure the upper, it finally imparts a smooth surface which removes all liability of such injury.

Cross-Int. 161. Is the "scalloping machine" mentioned in the list for anything other than ornamentation?

Ans. On shoes which are to be operated upon by the scalloping machine it is practicable to use a top-lift having in its portion which is to be removed, in the operation of the scalloping machine, defects or blemishes, which, without the operation of that machine, would render that top-lift unfit for use. For this reason I must answer the question in the affirmative.

Cross-Int. 162. Is the "scouring machine" mentioned in the list adapted for anything more than smoothing and finishing the heel?

Ans. The operation of the scouring machine is of such importance in the manufacture of a shoe that, undoubtedly, a shoe of the medium or better grades which has not been operated upon by the scouring machine would not be salable.

Mr. WEBSTER. Answer objected to as not responsive and evasive, and the attention of the court is respectfully called to the attitude of the witness and his apparent disregard of the request to answer the questions briefly and without comments.

Cross-Int. 163. I observe in the list stamping machine, model C, Eagle sole; stamping machine, model C, Eagle upper; stamping machine, Regent, models B and C; is it not a fact that these machines are used only for marking and ornamentation?

Ans. No, sir.

Cross-Int. 164. Please explain.

Ans. The last machine, stamping machine, Regent, is frequently used for ornamenting purposes only, but more generally it is used to stamp the maker's or retailer's name on the shoes. The first two machines named, stamping machine, model C, Eagle sole, and stamping machine, model C, Eagle upper, are used to mark the parts of uppers or soles to facilitate sorting them and getting together, out of many thousands of parts of shoes, those parts which are to be put together in one shoe.

Cross-Int. 165. Then the stamping machine, model C, Eagle upper, is a marking machine, is it not?

Ans. Yes, sir.

Cross-Int. 166. And that is all it is, isn't it?

Ans. Yes, sir.

Cross-Int. 167. I observe in your direct examination you refer to the various departments of the United Shoe Machinery Company. As these are scattered through the record, I will ask you if you will kindly now state those various departments all together?

Ans. The departments through which the United Company does its business are the —

Pulling over department,
Lasting department,
Goodyear department,
Metallic department,
Heeling department,
Eyeletting department,
Fitting room department, and
General department.

Cross-Int. 168. And has the United Company any outside departments, associations, or corporations under its control which handle any of its products?

Mr. PHILLIPS. Question objected to as relating to nothing touched upon in the direct examination of this witness, and counsel for defendant will instruct the witness not to answer the question unless ordered to do so by the court.

Ans. Under instructions of counsel, I decline to answer the question.

Cross-Int. 169. Are the machines under control of the United Company handled in any other manner than through the several departments you have specified?

Mr. PHILLIPS. The same objection.

Ans. Under instruction of counsel, I decline to answer.

Mr. WEBSTER. The attention of the court is respectfully called to the fact that the witness has testified in direct examination that various machines were put out through various departments, and it is respectfully urged that it is within the scope of cross-examination to inquire of the witness whether any of such machines were put out in any other manner.

Mr. PHILLIPS. Counsel for defendants has no objection to the question if limited to machines referred to during the examination of this witness.

[*Question read by stenographer.*]

Mr. PHILLIPS. The same instructions to the witness by counsel unless the question is modified.

Ans. Under instructions of counsel, I decline to answer.

Mr. PHILLIPS. Counsel for defendants instructs the witness to answer the interrogatory in so far as it relates to any machines which have been touched upon in his direct examination.

The WITNESS. As regards all of the machines mentioned by me in my previous testimony, none of them is put out otherwise than by the United Shoe Machinery Company through the department which I named in discussing the machine.

Cross-Int. 170. Will you kindly state what you mean by the term "put out"; that is, whether put out on lease, or rent, royalty, sold, or otherwise? And in order to save encumbering the record with interrogatories with reference to each of said machines, I would ask you to state particularly how each machine is "put out", going through the list without further interrogation in reference to the same.

Mr. PHILLIPS. Objected to as relating to nothing touched upon in the direct examination of this witness, and as having no bearing on any matter at issue in this hearing before the examiner, being incompetent, irrelevant and immaterial. As the interrogatory is

understood, it calls for a detailed statement as to each machine referred to by the witness. With this understanding of the interrogatory, I instruct the witness not to answer the question unless ordered to do so by the court. I can see no objection to the witness making a general answer as to machines referred to by him if counsel for petitioner desires to question him on such lines.

Ans. Under instructions of counsel, I decline to answer the question.

Mr. WEBSTER. The witness has testified in a manner to tend to show that all of the 149 machines mentioned in the list recited by him are covered by patents, and that they were "put out" by various departments. It is respectfully suggested by counsel for petitioner that it is within the scope of cross-examination to ascertain how such alleged patented things were "put out", whether under lease or otherwise. If counsel objects to the question because it relates to a large number of machines, counsel for petitioner will particularize, but it seems useless to encumber the record in that manner.

Mr. PHILLIPS. It seems perfectly evident that by the expression "put out" the witness means that the machines were placed in the hands of customers, and in his direct examination he touched in no manner upon the details of the contracts under which they were put out, nor is it to be assumed that he has any knowledge of such details, nor do the details of such contracts seem to have any bearing at all on any issue before this examiner. I therefore repeat my instructions to the witness.

Mr. WEBSTER. Counsel for the petitioner reserves the right to present this matter to the court at some convenient time.

Cross-Int. 171. You have in your direct testimony made reference in several instances to "minor machines". Will you kindly specify what you mean by that term?

Ans. The only machine in connection with which I recall using that expression is "repairing machine, model A, patent leather". I so characterized that operation because the hand operation which that machine superseded was a simple one, performed by girls, and

its object was the remedying of damage which had been done the shoe in the manufacturing operations.

Cross-Int. 172. Are there any machines in the remaining 148 machines specified by you which are of more importance and more essential and necessary in the bottoming of shoes than any of the other said 148 machines?

Mr. PHILLIPS. Question objected to as ambiguous, uncertain and vague, and not in any way based upon the direct examination of this witness.

Ans. I hesitate to draw any lines between the machines as regards their importance because all of them are so important that manufacturers demand them and use them. I should add, however, that not all of the machines on the list have to do with the bottoming operation.

Cross-Int. 173. Will you point out what machines have to do with bottoming operations only?

Ans. I should say that the following machines have to do with bottoming operations only: —

Assembling machine, Rex.
Assembling machine, model E, Rex.
Assembling machine, Rex turn shoe.
Assembling spindle.
Beating and slashing machine, Goodyear welt.
Blacking machine, model A, Crest heel.
Blacking machine, model B, Crest heel.
Burnishing machine No. 2, Goodyear impression stitch.
Cementing machine, model X, Stanbon channel.
Cementing machine, Star channel, models A and C.
Cementing machine, Star channel, model D.
Channeling machine, Economy insole.
Channeling machine, Goodyear (insole and turn).
Channeling machine, Goodyear Universal (turn work).
Channeling machine, Goodyear Universal (welt work).
Clinch machine, Universal double.
Cutting and scoring machine, insole, models D and E.
Fastening machine, model D, staple.

Flexible innersole machine, model X, Goodyear.
Flexible insole machine, Gem.
Fudge edge machine, Goodyear.
Grooving and beveling machine, Goodyear power welt.
Heel-breasting machine, model B, Imperial.
Indenting and burnishing machine, Goodyear welt.
Jointing machine, Goodyear.
Lasting machine, Consolidated hand method.
Lasting machine, McKay and Copeland.
Lasting machine, No. 5 U S M C.
Laying machine, Goodyear channel.
Laying machine, Goodyear improved sole, models B and C.
Laying machine, Goodyear improved sole (twin).
Leveling machine, model A, Atlas.
Leveling machine, Goodyear automatic sole, models A, B, C.
Leveling machine, Goodyear welt and turn (turn work).
Leveling machine, Goodyear welt and turn (welt work).
Leveling machine, Hercules.
Loading and attaching machine, McKay automatic heel.
Loading and attaching machine, model B, McKay automatic heel.
Lockstitch machine, model K, Goodyear out-sole rapid.
Lockstitch machine, model M, Goodyear out-sole rapid.
Molding machine, stitch-down upper.
Nailing machine, Alpha wood heel.
Nailing machine, American lightning.
Nailing machine, loose.
Nailing machine, Hungarian.
Nailing machine, No. 2 loose.
Opening machine, model C, Apex channel.
Pegging machine, Davey.
Pincer, U S M C bench.
Pounding machine, model E, Rex.
Pounding machine, model C, Rex rotary.
Pounding and beating-up machine, model A, Rex rotary.
Pounding and trimming machine, model B, Rex rotary.
Pricking machine, Premier heel.

Pulling machine, Goodyear insole tack.
Pulling machine, Goodyear upper tack.
Pulling and resetting machine, Goodyear tack.
Pulling and trimming machine, insole tack and turn shoe.
Pulling-over machine, model A, Rex.
Pulling-over machine, model B, Rex.
Pulling-over machine, model C, Rex.
Reducing machine, Goodyear out-sole channel shank.
Reinforcing machine, economy insole.
Rounding machine, Goodyear heel seat.
Rounding and channeling machine, Goodyear Universal.
Rounding and channeling machine, model E, Goodyear Universal.
Rounding and randing machine, Goodyear heel seat.
Scalloping machine, model B, top piece.
Scouring machine, model X, heel.
Screw machine, rapid standard.
Screw machine, model B, rapid standard.
Separating machine, Hadaway stitch.
Shoe machine, Goodyear welt and turn (when equipped for welt work).
Shoe machine, model G, Goodyear welt and turn (when equipped for welt work).
Shoe machine, model K, Goodyear welt and turn (when equipped for welt work).
Skiving machine, Goodyear shank welt.
Skiving machine, Goodyear universal shank.
Slugging machine, Universal.
Snipping machine, Goodyear insole toe.
Softening machine, toe, models C and D.
Softening machine, toe, model E.
Stapling machine, Goodyear upper.
Stapling machine, model B, Goodyear upper.
Sticking machine, model B, shank piece.
Stitching machine, economy insole.
Tacking machine, model A, grip.

Tacking machine, model B, grip.
Tacking machine, No. 1 U S M C insole.
Trimming machine, Goodyear insole heel seat.
Trimming machine, Goodyear insole heel seat, model B.
Trimming machine, Goodyear Universal inseam.
Trimming machine, model B, Rex toe.
Trimming machine, model A, Rex upper.
Trimming machine, model H, Rex upper.
Trimming machine, spring heel.
Trimming machine, Ultima heel.
Turning machine, Gem lip.
Turning machine, Goodyear forepart.
Turning machine, Goodyear heel.
Turning machine, Goodyear lip.
Turning machine, Goodyear welt edge.
Turning and slashing machine, Goodyear lip.
Wheeling machine No. 2, Goodyear impression stitch.

Cross-Int. 174. I observe that you have now specified 104 machines out of the 149 heretofore mentioned by you, which, as I understand your testimony, 104 machines are used in the bottoming of shoes. Please state whether some of the machines last referred to by you are adapted for use only in connection with welt shoes; and, if so, will you kindly point out what machines are adapted for the bottoming only of welt shoes?

Ans. The following machines have to do with bottoming operations on welt shoes only: —

Beating and slashing machine, Goodyear welt.
Channeling machine, economy insole.
Channeling machine, Goodyear (insole and turn) (when equipped for insole channeling).
Channeling machine, Goodyear Universal (welt work).
Cutting and scoring machine, insole, models D and E.
Flexible innersole machine, model X, Goodyear.
Flexible insole machine, Gem.
Grooving and beveling machine, Goodyear power welt.
Jointing machine, Goodyear.

Lasting machine, Consolidated hand method (welt).
Laying machine, Goodyear channel.
Laying machine, Goodyear improved sole, models B and C.
Laying machine, Goodyear improved sole twin.
Leveling machine, Goodyear automatic sole, models A, B, C.
Leveling machine, Goodyear welt and turn (welt work).
Lockstitch machine, model K, Goodyear out-sole rapid.
Lockstitch machine, model M, Goodyear out-sole rapid.
Pounding machine, model C, Rex rotary.
Pulling machine, Goodyear insole tack.
Pulling machine, Goodyear upper tack.
Pulling and resetting machine, Goodyear tack.
Reducing machine, Goodyear out-sole channel shank.
Reinforcing machine, economy insole.
Rounding machine, Goodyear heel seat.
Rounding and channeling machine, Goodyear Universal.
Rounding and channeling machine, model E, Goodyear Universal.
Rounding and randing machine, Goodyear heel seat.
Separating machine, Hadaway stitch.
Shoe Machine, Goodyear welt and turn (when equipped for welt work).
Shoe machine, model G, Goodyear welt and turn (when equipped for welt work).
Shoe machine, model K, Goodyear welt and turn (when equipped for welt work).
Skiving machine, Goodyear shank welt.
Skiving machine, Goodyear Universal shank.
Snipping machine, Goodyear insole toe.
Stapling machine, Goodyear upper.
Stapling machine, model B, Goodyear upper.
Stitching machine, Economy insole.
Trimming machine, Goodyear insole heel seat.
Trimming machine, Goodyear insole heel seat, model B.
Trimming machine, Goodyear Universal inseam.
Trimming machine, model A, Rex upper.

Trimming machine, model H, Rex upper.

Turning machine, Goodyear lip.

Turning machine, Goodyear welt edge.

Turning and slashing machine, Goodyear lip.

Cross-Int. 175. You have now enumerated, if I have counted correctly, forty-six out of said 104 machines which are adapted only for bottoming of welt shoes. Will you now kindly specify those that are adapted only for bottoming of McKay sewed shoes?

Ans. On a somewhat hurried review of the machines which I have enumerated as having to do with bottoming operations only, I note only one which is adapted for use on McKay sewed shoes only, and that is leveling machine, model A, Atlas. I believe, however, that several other machines are, as a matter of fact, used only on McKay sewed shoes, such as pounding and trimming machine, model B, Rex rotary, and trimming machine, model B, Rex toe.

Cross-Int. 176. Will you now kindly specify what machines are adapted for use in bottoming turn shoes only?

Ans. Assembling machine, Rex turn shoe.

Channeling machine, Goodyear insole and turn (equipped for turn work).

Channeling machine, Goodyear Universal (turn work).

Lasting machine, Consolidated hand method (turn toe).

Lasting machine, Consolidated hand method (turn heel seat).

Leveling machine, Goodyear welt and turn (turn work).

Molding machine, Goodyear power.

Pounding and beating-up machine, model A, Rex rotary.

Pulling and trimming machine, insole tack and turn shoe.

Pulling-over machine, model B, Rex.

Shoe machine, Goodyear welt and turn (when equipped for turn work).

Shoe machine, model G, Goodyear welt and turn (when equipped for turn work).

Shoe machine, model K, Goodyear welt and turn (when equipped for turn work).

Turning machine, Goodyear forepart.

Turning machine, Goodyear heel.

Cross-Int. 177. Are some of the machines you have enumerated as having to do with bottoming operations adapted for both welt bottoming and turn bottoming? If so, will you specify such machines?

Ans. Blacking machine, model A, Crest heel.

Blacking machine, model B, Crest heel.

Burnishing machine No. 2, Goodyear impression stitch.

Channeling machine, Goodyear (insole and turn; may be equipped for either work).

Channeling machine, Goodyear Universal (may be equipped for either work).

Heel-breasting machine, model B, Imperial.

Lasting machine, Consolidated hand method (special models for either work).

Loading and attaching machine, model B, McKay automatic heel.

Nailing machine, American lightning.

Nailing machine, loose.

Nailing machine No. 2, loose.

Scalloping machine, model B, top piece.

Scouring machine, model X, heel.

Shoe machine, Goodyear welt and turn (may be equipped for either work).

Shoe machine, model G, Goodyear welt and turn (may be equipped for either work).

Shoe machine, model K, Goodyear welt and turn (may be equipped for either work).

Slugging machine, Universal.

Tacking machine, No. 1 U S M C insole.

Trimming machine, Ultima heel.

Cross-Int. 178. Are any of the machines mentioned by you as adapted only for bottoming shoes adapted for bottoming McKay nailed or metallic-fastened shoes?

Ans. The following machines, which I have enumerated as having to do with bottoming operations only, are adapted for use in

connection with the bottoming of nailed, standard screwed or pegged shoes: —

Assembling machine, Rex.
Assembling machine, model E, Rex.
Assembling spindle.
Blacking machine, model A, Crest heel.
Blacking machine, model B, Crest heel.
Burnishing machine, No. 2, Goodyear impression stitch.
Cementing machine, model X, Stanbon channel.
Cementing machine, Star channel, models A and C.
Cementing machine, Star channel, model D.
Clinch machine, Universal double.
Fastening machine, model D, staple.
Heel-breasting machine, model B, Imperial.
Indenting and burnishing machine, Goodyear welt.
Lasting machine, Consolidated hand method (McKay).
Lasting machine, McKay & Copeland.
Leveling machine, Hercules.
Loading and attaching machine, McKay automatic heel.
Nailing machine, loose.
Nailing machine, Hungarian.
Nailing machine, No. 2 loose.
Opening machine, model C, Apex channel.
Pegging machine, Davey.
Pincer, U S M C Bench.
Pounding and trimming machine, model B, Rex rotary.
Pricking machine, Premier heel.
Pulling-over machine, model A, Rex.
Scalloping machine, model B, top piece.
Scouring machine, model X, heel.
Screw machine, rapid standard.
Screw machine, model B, rapid standard.
Slugging machine, Universal.
Softening machine, toe, models C and D.
Softening machine, toe, model E.
Tacking machine, model A, grip.

Tacking machine, model B, grip.
Trimming machine, Ultima heel.
Wheeling machine No. 2, Goodyear impression stitch.
[*Adjourned to 10 o'clock* A. M., *Wednesday, October 29, 1913.*]

BOSTON, MASS., October 29, 1913.

Cross-Int. 179. Kindly state whether any of the machines set out in the list of 149 machines are adapted only for use in the manufacture of shoes having extension edges, Scotch edges or Baltimore edges; and, if so, will you kindly specify such machines or appliances?

Ans. I do not know that any of the machines enumerated on the list produced in answer to interrogatory 7 is adapted only for use in the manufacture of shoes having extension edges, either Scotch edges or Baltimore edges.

Cross-Int. 180. Are any of the machines about which you have testified, and in which testimony you have made special reference to the use of such devices or machines in the manufacture of shoes having extension edges, necessary for the production of shoes which do not have extension edges?

Mr. PHILLIPS. Question objected to as vague and ambiguous.

Ans. I do not know that any machine is necessary for the production of shoes not having extension edges. Such shoes were made long before there were any shoe machines.

Cross-Int. 181. In various portions of your direct testimony you have referred specifically to machines and appliances which, if I understand you, you testify are useful in the manufacture by machinery of shoes having extension edges. Will you now inform the court whether such machines and appliances for the manufacture of shoes by machinery are necessary, in the manufacture of shoes by machinery, which shoes do not have extension edges?

Mr. PHILLIPS. Question objected to as vague, ambiguous and uncertain.

Ans. It is the practice in the manufacture of shoes to use the machines which, as explained in my previous testimony, are adapted for use in the manufacture of shoes having extension

edges, both in the manufacture of such shoes and in the manufacture of shoes which do not have extension edges so far as such shoes are made.

Mr. WEBSTER. Answer objected to as not responsive, and evasive.

Cross-Int. 182. Have you now answered the question as fully as you are able?

Ans. Perhaps I should add that in the use of some of the machines referred to in my preceding answer the mechanism adapting those machines particularly for efficient operation on extension edge shoes would not be operated when the machines were used on shoes not having extension edges, while in other machines the organization enabling those machines to do extension edge work would be operated in a different manner when the work being done by the machine was not extension edge work.

Cross-Int. 183. Well, shoes without extension edges were manufactured by machinery many, many years before shoes having extension edges were manufactured by machinery, were they not?

Ans. Shoes not having extension edges were manufactured by machinery many years before shoes having extension edges were made by machinery.

Cross-Int. 184. In your direct testimony you have made reference to machines and mechanisms adapted for the manufacture of shoes by machinery on "razor toe lasts", such as is shown in Defendants' Exhibit 134. Kindly state whether machines or mechanisms to which you have so referred are necessary for the manufacture of a plain, ordinary shoe, such as, for instance, shown in Defendants' Exhibit 161.

Mr. PHILLIPS. Question objected to as vague and ambiguous.

Ans. Defendants' Exhibit 134 was produced by me to illustrate the early steps in the development of modern lasts which began about 1895 and which led to the use of lasts having wide variations in widths and shapes of toes, as illustrated in Defendants' Exhibits 135, 136, 137 and 142. That development in lasts led to general use of so-called "crooked lasts", as distinguished from the nearly straight lasts used until about 1895 and illustrated in

Defendants' Exhibit No. 141. The shoe of Defendants' Exhibit 161 was made upon a modern "crooked last". The improvements to which I have referred in my previous testimony as adapting machines for the changing conditions of 1895 and of the years immediately following, as illustrated in Defendants' Exhibit 134 and in the other exhibits to which I have just referred, better adapted those machines for operating upon shoes such as shown in Defendants' Exhibit 161, and the improvements in older machines and the new machines which have been introduced since the period when lasts like Defendants' Exhibit 134 were used are very useful and are extensively used in the manufacture of shoes made on modern lasts, as was the shoe of Defendants' Exhibit 161.

Mr. WEBSTER. Answer objected to as evasive and not responsive.

Cross-Int. 185. Have you now answered the question as fully as you are able?

Mr. PHILLIPS. It is suggested that the question is answered as well as it it possible to answer it in the form in which it is stated.

Ans. I endeavored to make my preceding answer clear and responsive. However, I can try again by stating that the operations of the machines in question could be performed by hand, if desired, on a shoe like Defendants' Exhibit No. 161, so that the machines or machinery inquired about are not strictly "necessary" for the production of this shoe.

Mr. WEBSTER. Answer objected to as evasive and not responsive.

Cross-Int. 186. Am I correct in understanding that you testify that the last marked "Defendants' Exhibit 131" is what is known as a straight last and is the kind of last that was in use many years pior to 1895?

Ans. I believe I have never called the last of Defendants' Exhibit No. 131 a "straight" last. For convenience in comparing it with modern "crooked lasts", I have referred to it as "nearly straight". That last was produced by me as "a last such as was in use in 1893 and 1894".

Cross-Int. 187. Will you now state whether lasts like the last marked "Defendants' Exhibit 131" were in use prior to 1893?

Ans. Yes, sir; lasts substantially like the last of Defendants' Exhibit 131 were in use prior to 1893.

Cross-Int. 188. And for how long prior, so far as you know, or according to your best information?

Ans. Lasts having the simple lines and regular formation of the last of Defendants' Exhibit 131 were in use for a long time prior to 1893, although in the earlier years they were even simpler and more symmetrical on the opposite sides than is this last of Defendants' Exhibit 131.

Cross-Int. 189. Will you now state what you mean approximately by the term "for a long time prior to 1893"; that is, whether you mean five years, ten years, or twenty years?

Ans. I mean the entire period during which machines have been used in the manufacture of shoes.

Cross-Int. 190. Now, will you kindly state the period referred to in your last answer during which shoes have been manufactured by machine?

Mr. PHILLIPS. Question objected to as relating to nothing touched upon in the direct examination of this witness, and as being vague and ambiguous, it not appearing what machine processes are referred to, whether in the manufacture of the whole shoe or merely parts.

Ans. Machines for performing various operations in the manufacture of different kinds of shoes were first produced and used at different times in the nineteenth century. The first machine for attaching soles of McKay shoes was produced in the early sixties. The first commercial pegging machine of which I am aware was also introduced in the sixties, while the first lasting machine which was commercially used was first put into shoe factories in the late sixties. The first commercial machine for attaching the welts and uppers of welt shoes to their insoles was put into commercial use in the seventies. I believe that the first machine for attaching out-soles of welt shoes to their welts was also first used commercially in the seventies.

Cross-Int. 191. Now, as I understand you, lasts substantially like the last of Defendants' Exhibit 131 were in use as early as

1885, and that shoes were lasted by machinery over such lasts as early as 1885. Kindly state if I am correct in my understanding.

Ans. That statement is substantially correct, qualified, of course, by the explanation made in my preceding answers that as we go back through the period prior to the date when this last was used, that is, 1893 and 1894, we find the lasts increasingly simple and symmetrical on their opposite sides.

Cross-Int. 192. In your direct testimony you have made, as I recollect it, special reference to machines adapted for the manufacture of shoes by machinery over razor-toe lasts such as are shown in Defendants' Exhibit 134, and also over lasts known as "bull dog" such as are shown in Defendants' Exhibit 135. Will you now kindly inform the court whether the machines and mechanisms to which you have testified with reference to lasting shoes by machinery over said lasts known as "razor toe" and "bull dog" are necessary in the lasting of shoes over the old type of last, which you say was in use as early as 1885?

Mr. PHILLIPS. Objected to as vague and ambiguous.

Ans. Such machines are obviously not necessary in making shoes on lasts like that of Defendants' Exhibit No. 131, since, among other reasons, at the period inquired about, 1885, these machines had not been produced.

Cross-Int. 193. In your direct testimony you have frequently made reference to machines as "commercial". Will you kindly explain just what you mean when you refer to a machine as having first become a commercial machine?

Ans. When I have stated in my direct testimony that a machine was first put out for commercial use on a given date, I have meant that on that date the machine was first put into a shoe factory for regular use under commercial conditions, after a long period of experimental use of the machine, including, first, a trying out at our Beverly factory, and then experimental use of the machine, or, sometimes, of several of the machines, under differing commercial conditions in various shoe factories, during which period parts of the machine which were found weak and likely to break were strengthened or redesigned, any abrupt or harsh movements in the

operating mechanisms were remedied and such changes were made as were needed to make the machine universal, that is, adapted to all kinds of work for which it was designed.

Cross-Int. 194. In your direct testimony you frequently state certain patents are "owned or controlled" by the United Company. Kindly state what you mean by the word "controlled" as distinguished from the word "owned".

Ans. The United Company has exclusive licenses under certain patents, and some patents setting forth in their claims mechanisms embodied in the machines of the United Company are owned by other companies in which the United Company has a controlling stock interest. I used the expression "controlled" to include such patents as could not be said strictly to be "owned" by the United Company.

Cross-Int. 195. Will you specify what patents are controlled by the United Company because of its controlling a majority interest in such company as is the owner of such patents?

Mr. PHILLIPS. Objected to as having no relation to any matter touched upon in direct examination of this witness, and having no bearing upon any issue before this examiner under the order of the court. The witness is instructed not to answer the question unless ordered to do so by the court.

Ans. Under instructions of counsel, I decline to answer.

Mr. WEBSTER. Counsel for the petitioner respectfully calls the attention of the court to the fact that the question of "patents" is before the examiner, and that, in view of the fact that the defendant justifies under patents alleged by it as being its property, it is respectfully submitted that the question is entirely competent.

Cross-Int. 196. In your direct testimony you frequently state that a machine "embodies the means set forth in the claim" of a patent. Do you wish to be understood as testifying when using such language that such machine operates in all respects as defined in the claim referred to by you?

Mr. PHILLIPS. I shall have to ask you to be a little more specific and point out the direct testimony of the witness, or the portion of the testimony, in which he has used the language referred to in your question.

Mr. WEBSTER. In response to the request of counsel for defendants, counsel for petitioner calls attention to the phraseology found in the witness' answer on page 2276 of the typewritten record [printed page 2278], reading as follows: "The mechanism set forth in all of the eleven claims of this patent No. 473,870 was embodied in the out-sole rapid lockstitch machine as it was put out by the Goodyear Shoe Machinery Company just prior to February, 1899."

Mr. PHILLIPS. It does not seem to me that the language just quoted justifies the question.

Mr. WEBSTER. Do you object to it and tell him not to answer?

Mr. PHILLIPS. I do, unless you point out the portion of the record in which witness has used the language referred to in the question.

Mr. WEBSTER. And you instruct him not to answer? [*No response.*] Counsel for petitioner calls attention further to the phraseology found on page 2288 [printed page 2286] at the bottom of the page, reading as follows: "Of the patents in the above list . . . set forth in the claims mechanisms embodied in all of the types of fudge edge stitching mechanisms."

Mr. PHILLIPS. I have no objection to the witness stating what he means by any language used in the testimony, but it does not seem to me of any materiality that he define language which does not appear to have been used by him.

Mr. WEBSTER. Does he decline to answer, or do you instruct him not to answer?

Mr. PHILLIPS. I instruct the witness not to answer the question in its present form.

The WITNESS. Under instructions of counsel, I decline to answer the question in its present form.

Cross-Int. 197. Do you say you have not used that language?

Ans. No, sir; I do not say that.

Cross-Int. 198. If you have used such language, will you state whether you meant by it that the machines referred to by you operated as defined in the claim?

Ans. If I have, in any of my previous testimony, stated in con-

nection with any machine which I was discussing that the machine "embodies the means set forth in the claim" of a patent to which I referred, I meant that upon comparing the structure recited in the claim with the structure of the machine in question I found that the structure recited in the claim was present in the machine.

Cross-Int. 199. Then you did not mean that the machine operated as defined in the claim, but that it was capable of so operating. Am I right in my statement?

Mr. PHILLIPS. Question objected to as being too vague and ambiguous to be intelligibly answered, it not appearing what specific claims are referred to or that any claim referred to defines a mode of operation.

Ans. If I have used the expression "embodies the means set forth in the claim" with reference to a claim which contained a functional statement indicating how the mechanism recited in the claim operates, I have meant that the machine with which I have compared the claim operated as stated in the claim.

Cross-Int. 200. You have, in your direct testimony, enlarged to a considerable extent as to the large cost to the defendant company in the production of various machines and in the invention of various types of machines, as shown in patents to which you have made reference. I now ask you whether you wish to have it understood by such testimony that all of the inventions set forth in the various patents about which you have testified were inventions made by salaried or hired employees of the United Company?

Ans. No, sir; I do not wish so to be understood.

Cross-Int. 201. Is it, then, a fact that very many of the patents about which you have testified were purchased by the United Company of parties other than its employees?

Ans. It is a fact as to some of them; yes, sir.

Cross-Int. 202. Do any of the patents about which you have testified relate to machines known as "slugging machines", such as were manufactured by one Preston, or such as were made under patents issued to, or owned by, one Preston?

Mr. PHILLIPS. Question objected to as having no bearing upon anything touched upon in the direct examination of this witness,

and the witness is instructed to answer the question only so far as it relates to any patent with regard to which he has testified.

Ans. In my testimony regarding the experimental slugging machine, first known as "Ziz slugging machine", and later as "slugging machine No. 5", I enumerated, in the list of "patents which set forth in their claims the organization of this machine", certain patents granted to the United Shoe Machinery Company as assignee of Albert F. Preston.

Cross-Int. 203. Will you kindly enumerate the patents referred to in your last answer?

Ans. Reissue patent No. 12,820 (reissued June 23, 1908), Albert F. Preston, machine for driving fasteners.

Reissue patent No. 12,821 (reissued June 30, 1908), Albert F. Preston, nailing machine.

Patent No. 1,030,829, June 25, 1912, Albert F. Preston, machine for making and driving fasteners.

Cross-Int. 204. Do any of the patents about which you have testified relate to machines known as "the Richardson machine"?

Mr. PHILLIPS. Objected to as relating to nothing touched upon in the direct examination of this witness, and unless counsel can show for what reason the question is competent I shall instruct the witness not to answer.

Ans. Under instructions of counsel, I decline to answer.

Mr. WEBSTER. Counsel for petitioner respectfully suggests that the competency of the question should be left for the determination of the court hereafter.

Cross-Int. 205. In your testimony you have referred to machines for attaching the bottoms of McKay sewed shoes, and in connection with such testimony you have referred to various patents. Will you state whether any of the patents to which you have made reference in your testimony relate to a machine for attaching bottoms of McKay sewed shoes of the type of machine known as "the Richardson machine"?

Mr. PHILLIPS. The same objection and the same instruction.

Ans. Under instructions of counsel, I decline to answer.

Cross-Int. 206. During your direct testimony you made refer-

ence to various machines and mechanisms which you stated were covered by claims of pending applications, and I, during the time of such testimony, entered on record a notice that I would call for the names of the applicants, together with the date of the filing of such applications, and I now, without waiving the objection heretofore made to the introduction of such testimony, will ask you if you will give the names of the various applicants for patents of said pending applications and the date when said applications were filed?

Mr. PHILLIPS. It does not seem to be material what the exact date of a pending application is. I see no objection to the witness giving the name of the applicant and a statement as to whether the application was filed before or after December 12, 1911, and I shall instruct him to answer the question with this limitation.

Ans. The request for this information was made in connection with the machines, the discussion of which begins on page 2787 of the typewritten record [printed page 2631]. The names of the applicants who filed pending applications for patents referred to in that discussion are as follows: —

ASSEMBLING MACHINE: REX TURN TOE.

One application for patent, Orrell Ashton, filed prior to December 12, 1911.

One application for patent, Orrell Ashton, filed since December 12, 1911.

BUILDING MACHINE — PYRAMID HEEL: MODELS B, C, D.

One application for patent, John H. Richardson, filed prior to December 12, 1911.

CEMENTING MACHINE — HUB LINING: MODELS E AND F.

One application for patent, William G. Eaton, filed prior to December 12, 1911.

One application for patent, Edward Erickson and John W. Cosgrove, filed since December 12, 1911.

CUTTING AND SCORING MACHINE — INSOLE: MODELS D AND E.

One application for patent, Miller Cook, filed prior to December 12, 1911.

One application for patent, James Cavanagh, filed prior to December 12, 1911.

EMBOSSING MACHINE: MODEL B.

One application for patent, Henry W. Winter, filed prior to December 12, 1911.

One application for patent, Malcolm F. Wallace, filed since December 12, 1911.

One application for patent, Henry W. Winter, filed since December 12, 1911.

EYELETTING MACHINE: CAMEO FOOT POWER.

One application for patent, Daniel W. Colby, filed prior to December 12, 1911.

EYELETTING MACHINE: UNIVERSAL.

One application for patent, Walter Shaw, filed prior to December 12, 1911.

FINISHING MACHINE: U S M C BUTTONHOLE.

Three applications for patents, George S. Hill, filed prior to December 12, 1911.

One application for patent, George S. Hill, filed since December 12, 1911.

MAKING MACHINE: BUTTONHOLE.

Two applications for patents, George S. Hill, filed prior to December 12, 1911.

Three applications for patents, George S. Hill, filed since December 12, 1911.

MARKER: IMPROVED STAR SOLE.

One applicatiou for patent, Hiram W. Gordon, filed prior to December 12, 1911.

MOLDING MACHINE — AMERICAN TWIN SOLE: MODELS B AND C.

Two applications for patents, Edwin N. Preble, both filed prior to December 12, 1911.

MOLDING MACHINE: GOODYEAR POWER.

One application for patent, William C. Meyer, filed prior to December 12, 1911.

MOLDING MACHINE: STITCH-DOWN UPPER.

One pending application for patent, Karl Engel and Louis M. Brown, filed prior to December 12, 1911.

PINCER MACHINE: U S M C BENCH.

One application for patent, Pearl J. Wentworth, filed prior to December 12, 1911.

PUNCHING MACHINE — MODEL A: ROYAL TIP.

One pending application for patent, John H. Rigby, filed since December 12, 1911.

ROUNDING MACHINE — PLANET SOLE: MODELS C AND D.

One pending application, Benjamin F. Mayo, filed prior to December 12, 1911.

One application for patent, Frederick J. Nash, filed prior to December 12, 1911.

One application for patent, Gideon Julian, filed since December 12, 1911.

ROUNDING AND RANDING MACHINE: GOODYEAR HEEL SEAT.

One application for patent, William C. Baxter, filed since December 12, 1911.

SANDING MACHINE — MODEL A: TAP AND SOLE.

One pending application, Jacob R. Scott, filed prior to December 12, 1911.

SCARFING MACHINE — MODEL N: TAP.

One pending application, John B. Hadaway, filed prior to December 12, 1911.

SCREW MACHINE — MODEL B: RAPID STANDARD.

One application for patent, Louis A. Casgrain, filed prior to December 12, 1911.

SKIVING MACHINE — MODEL A: CHAMPION HEEL LIFT.

One application for patent, Joseph H. Pope, filed prior to December 12, 1911.

One application for patent, Frederick J. Nash, filed prior to December 12, 1911.

SKIVING MACHINE — MODEL A: CHAMPION SHANK.

One application for patent, Joseph H. Pope, filed prior to December 12, 1911.

One application for patent, Frederick J. Nash, filed prior to December 12, 1911.

One application for patent, Jacob K. Kourian, filed prior to December 12, 1911.

SKIVING MACHINE — PLUMA: MODELS C AND D.

One application for patent, Paul Krippendorf, filed prior to December 12, 1911.

One application for patent, Eugene F. Davenport, filed prior to December 12, 1911.

Three applications for patents, Alexander M. Alexander, filed prior to December 12, 1911.

SNIPPING MACHINE — GOODYEAR INSOLE TOE.

One application for patent, John B. Hadaway, filed prior to December 12, 1911.

SOFTENING MACHINE — TOE: MODELS C AND D.

One application for patent, Eugene L. Keyes, filed prior to December 12, 1911.

One application for patent, William A. Boyden, filed prior to December 12, 1911.

One application for patent, Louis M. Brown, filed prior to December 12, 1911.

One application for patent, Frank E. Fernald, filed prior to December 12, 1911.

One application for patent, Gustaf E. Hallquist, filed prior to December 12, 1911.

SOFTENING MACHINE — TOE: MODEL E.

One application for patent, Eugene L. Keyes, filed prior to December 12, 1911.

One application for patent, William A. Boyden, filed prior to December 12, 1911.

One application for patent, Louis M. Brown, filed prior to December 12, 1911.

One application for patent, Frank E. Fernald, filed prior to December 12, 1911.

One application for patent, Gustaf E. Hallquist, filed prior to December 12, 1911.

SPLITTING MACHINE — EMPIRE: MODELS C AND D.

One application for patent, Frederick M. Furber, filed prior to December 12, 1911.

STAMPING MACHINE — MODEL C: EAGLE SOLE.

One application for patent, Henry W. Winter, filed prior to December 12, 1911.

STAMPING MACHINE — MODEL C: EAGLE UPPER.

One application for patent, Henry W. Winter, filed prior to December 12, 1911.

TACKING MACHINE — No. 1 U S M C INSOLE.

One application for patent, Fred L. MacKenzie, filed since December 12, 1911.

TRIMMING MACHINE — ULTIMA HEEL.

One application for patent, Alonzo E. West, filed prior to December 12, 1911.

Cross-Int. 207. Do you decline to give the date of the filing of said applications?

Mr. PHILLIPS. In view of the immateriality of the exact date of the filing of these applications, so far as relates to any issue triable under the order of the court before this examiner, I shall instruct the witness not to give the dates any further than he has heretofore, unless instructed to do so by the court.

Ans. Under instructions of counsel, I decline to state the exact dates when the applications referred to in my answer immediately preceding were filed.

Cross-Int. 208. *De bene*, and without waiving the objection heretofore made, does the list of pending applications you have

just read into the record comprise all the pending applications with reference to which you have testified?

Ans. I have, in many instances, used such expressions as: "It is anticipated that patent protection will eventually be obtained." I cannot state, without going through the records, whether when I have specifically referred to pending applications I have stated the name of the inventor and indicated whether the application was filed before or since December 12, 1911.

Cross-Int. 209. Do you decline to produce and read into the record or to testify as to all applications for patents with reference to which you have testified in your direct examination, giving the names of the applicants and the dates of the filing of such applications?

Mr. PHILLIPS. We have already stated our position in this matter, that in view of the immateriality of the exact date of the filing of any of these applications, as at present advised the witness is instructed not to state such dates unless ordered to do so by the court.

Ans. If desired, I can go through the record and note instances where I have specifically referred to pending applications and prepare a list stating the name of the inventor and indicating whether the application was filed before or since December 12, 1911.

Cross-Int. 210. And you decline to give the date of the filing of such applications, do you?

Ans. Under instructions of counsel, I do, except where such dates have already been stated on the record.

Mr. WEBSTER. Counsel for the petitioner gives notice that objection heretofore made to all testimony or reference to pending applications or the structures of pending applications will be insisted upon at the hearing, and that at the proper time motion will be made to strike from the record all testimony relating to such applications and mechanisms referred to in such applications.

Cross-Int. 211. Are all departments of the United Company under one management or head?

Mr. PHILLIPS. Question objected to as relating to nothing that has been referred to in the direct examination of this witness and

nothing of any materiality to any issue to be heard before this examiner under the order of the court, and as the witness can be assumed to have no knowledge as to the management of the United Shoe Machinery Company, the witness is instructed that he need not answer the question unless ordered to do so by the court.

Ans. Under instructions of counsel, I decline to answer the question.

Mr. WEBSTER. The attention of the court is respectfully called to the fact that the witness has testified that various machines were put out under various departments specified by him, and it is respectfully urged that in cross-examination the petitioner is entitled to know whether these departments are independent of each other, dependent upon each other, or under one management.

Cross-Int. 212. Now, inviting your attention to your testimony with reference to welt and turn machines, I understand that the machine which you have designated as the 1899 machine went into use prior to 1899; am I correct in my understanding?

Ans. Yes, sir.

Cross-Int. 213. Kindly state how long prior to 1899 the welt and turn machine designated by you as the 1899 machine went into use.

Ans. I don't know the exact date, but it was several years prior to 1899.

Cross-Int. 214. And by what company was it put out?

Ans. By the Goodyear Shoe Machinery Company.

Cross-Int. 215. Do you know whether that was the Goodyear Shoe Machinery Company of Connecticut, or of Maine?

Mr. PHILLIPS. Question objected to as relating to nothing touched upon in the direct examination of this witness, and the witness can be assumed to know nothing with regard to the incorporation of the Goodyear Shoe Machinery Company, whether it was in Maine or Connecticut.

Ans. It was put out by the company which was doing business under the name of "Goodyear Shoe Machinery Company". I do not recollect under the laws of what State that company was incorporated.

Cross-Int. 216. Are you willing to ascertain and testify later?

Ans. Yes, sir; if so instructed by counsel.

Mr. WEBSTER. Counsel for petitioner inquires of counsel for defendant whether he will permit the witness to ascertain the fact inquired about and testify to it later?

Mr. PHILLIPS. It seems to me that this whole matter is foreign to any inquiry material under the present order of the court, and that it has all been gone into in the testimony of several witnesses in open court. But as at present advised I can see no objection to the witness securing such data, but I reserve any objection that I may desire to make until later.

Cross-Int. 217. I notice that in your answer 8 you say: "a welt and turn machine is used to perform two different operations in the manufacture of shoes . . . to attach the welt and upper to the insole and also to secure together the upper and sole of a turn shoe." Kindly state whether any change is required in the welt and turn machine referred to when it is performing the "different operations".

Ans. Yes, sir.

Cross-Int. 218. What changes?

Ans. The welt guide of the machine which is used when the machine is employed on welt work has to be removed and a guide suitable for the turn work substituted.

Cross-Int. 219. And the operation of the remainder of the machine is the same in both instances?

Ans. Yes, sir.

Cross-Int. 220. So that the change is merely a change in guides; am I right?

Ans. Yes, sir.

Cross-Int. 221. I observe in your answer 9 you say: "The machine of this Goodyear and Hadley patent was put into commercial use and was extensively used for some years." Kindly state for how many years that machine was used, according to the best of your information.

Ans. I think it was used for at least three or four years.

Cross-Int. 222. And what machine followed the machine you refer to as the Goodyear and Hadley machine?

Ans. The machine of the Goodyear and Hadley patent No. 170,547, November 30, 1875, was superseded by the machine of patent No. 190,709, May 15, 1877, Dancel.

Cross-Int. 223. And for how long a time was the machine of the Dancel patent of May 15, 1877, in use, so far as you are informed?

Ans. Machines constructed substantially as shown in the Dancel patent No. 190,709 were used commercially for many years; certainly over twenty years.

Cross-Int. 224. And were the machines of the Dancel patent 190,709 adapted for welt and turn work?

Ans. Yes, sir.

Cross-Int. 225. And did the machine of the Dancel patent No. 190,709 continue in commercial use until the machine you designate as the welt and turn machine of 1899 came into use?

Ans. Yes, sir.

Cross-Int. 226. And are you unable to state when the old machine called by you the "welt and turn machine of 1899" first went into use?

Ans. I cannot at this time state the time accurately, although, as I have previously stated, it was several years prior to 1899.

Cross-Int. 227. Pardon me, but the term "several years" may mean three years and may mean fifteen years; will you kindly approximate it as near as you possibly can?

Ans. I believe the machine was first put into commercial use about 1894, or within one or two years before or after that date.

Cross-Int. 228. And was the machine you refer to as having gone into use in 1894, or thereabouts, the machine that was officially known as "Sewing Machine, Goodyear Universal Inseam"?

Ans. No, sir.

Cross-Int. 229. Has the machine termed by you "welt and turn machine of 1899" ever gone out of use, so far as you know?

Ans. No, sir; the machine is still being used.

Cross-Int. 230. And is it still being manufactured?

Ans. No new machines like the welt and turn machine of 1899

are now being built, as the demand has practically or entirely ceased, and any order for one of those machines which the company might receive would be filled from the large number of machines which have been superseded by the later models, and which the company has on hand.

Cross-Int. 231. When you say in the last answer that none of the welt and turn machines of 1899 are being built, you mean that such machines are not being built by the United Company, do you not?

Ans. Yes, sir.

Cross-Int. 232. Can you state approximately how many of the welt and turn machines of the kind referred to by you as being welt and turn machine of 1899 are now in use in the United States?

Ans. I cannot state from memory, but shall be glad to ascertain, if desired?

Cross-Int. 233. Will you kindly do so, and at the same time, if convenient, ascertain and be prepared to testify later as to how many of such machines were in use in the United States in January, 1908, 1909, 1910, 1911 and 1912?

Ans. I shall be glad to obtain the information requested.

Cross-Int. 234. As I recall your direct testimony, the welt and turn machine of 1899 continued to be the successful commercial welt and turn machine up to October, 1908. Kindly state if I am correct in my understanding.

Ans. The welt and turn machine of 1899 continued to be the standard commercial machine of the United Company until the improved machine known as "Shoe Machine, Welt and Turn, Model G" was introduced in 1908. I should add, however, that from the time shoe machine, Goodyear welt and turn, model E, was introduced in July, 1902, that machine was put out in considerable numbers during the entire period from 1902 until the model G machine was introduced.

Cross-Int. 235. Can you give us any idea as to about how many of the 1899 welt and turn machines are in use today; that is, whether it is a dozen, hundreds, or more?

Ans. I prefer not to guess at the number of those machines now

in use, but have already arranged to ascertain the exact number and shall be prepared to state that number at the next session.

Cross-Int. 236. The welt and turn machine of 1899 was constructed and arranged to carry out the so-called Briggs method as defined in the patent to Briggs No. 461,793, October 20, 1891, was it not?

Ans. Yes, sir.

Cross-Int. 237. And the mechanism incorporated in that welt and turn machine of 1899 is set forth in patent to French and Meyer No. 412,704, dated October 8, 1889, is it not?

Ans. Patent No. 412,704, October 8, 1889, French and Meyer, shows substantially the welt and turn sewing machine of 1899 with the changes in the organization shown in the drawings and described in the specifications of that patent, which are shown and described in the claims of patents of later date about which I have previously testified.

Cross-Int. 238. The "patents of later date", as I understand your testimony, are:—

Patent No. 488,505, LaChapelle, dated December 20, 1892, tension device for sewing machine.

Patent No. 518,911, Briggs, dated April 24, 1894, take-up for shoe-sewing machine.

Patent No. 561,386, French, dated June 2, 1896, sewing machine. Am I correct in my understanding?

Ans. Yes, sir.

Cross-Int. 239. Then the welt and turn machine of 1899 was, as I understand it, constructed and the machine operated as set forth in those four patents; am I correct?

Ans. Yes, sir.

Cross-Int. 240. And, so far as you know, the welt and turn machine of 1899 was not within the terms of any patent other than the four mentioned; am I right?

Ans. There is another patent, No. 495,452, April 11, 1893, Cole, sewing machine, which shows in its drawings and describes in its specification and in its two claims mechanism which was embodied in the welt and turn sewing machine of 1899.

Cross-Int. 241. Was the mechanism of the Cole patent last referred to by you incorporated in all the machines that were put out by the United Company of the welt and turn type?

Ans. I think so.

Cross-Int. 242. Have you now enumerated all the patents which relate to the welt and turn machine of 1899?

Ans. In addition to those patents there are some claims in patent No. 317,759, May 12, 1885, French, which define some features of construction of the 1899 welt and turn machine, and patent No. 732,729, July 7, 1903, French and Meyer, granted on an application filed December 21, 1898, discloses and defines in its claims an alternative form of wax pot used on the welt and turn machine of 1899.

Cross-Int. 243. Have you now mentioned all the patents that have any bearing or relation, so far as you know, to the welt and turn machine of 1899?

Ans. Yes, sir, as that machine was put out in 1899.

Cross-Int. 244. Were any of the mechanisms defined in any of the patents you have specified omitted from the welt and turn machine of 1899 when it was being put out in 1899?

Ans. Not so far as I know, except that the wax pot of patent No. 732,729, July 7, 1903, was, as I have stated, an alternative form, and was not supplied on all machines.

Cross-Int. 245. Were the mechanisms of any of the patents specified by you necessary to the successful operation of the machine when constructed as set out in patent No. 412,704, or were these mechanisms simply required for the purpose of making the machine more efficient or improving its operation?

Ans. So far as I know, the machine was never commercially used until it incorporated the mechanisms shown and set forth in the claims of the following patents: —

Patent No. 488,505, December 20, 1892, LaChapelle.

Patent No. 518,911, April 24, 1894, Briggs.

Patent No. 561,386, June 2, 1896, French.

Accordingly, I do not know that I can state whether or not the mechanisms set forth in those patents were necessary to the success of the operation of the machine.

Cross-Int. 246. So that you, from your extended experience and study of the art, cannot inform the court whether the machine of patent No. 412,704, designed and adapted to carry out the Briggs method, was operative commercially without the addition of the mechanisms of the three patents referred to, or not; is that correct?

Ans. It is not correct.

Cross-Int. 247. Will you, then, kindly explain?

Ans. I did not make any statement as to the operativeness of the machine of patent No. 412,704.

Cross-Int. 248. Do you now say it was operative commercially if constructed as set out in patent No. 412,704, or do you say you do not know whether it was, or would be, or not?

Ans. I have no doubt that the machine shown in the drawings and described in the specifications of patent No. 412,704 could be used in attaching the welt of a welt shoe. My preceding answer, in which I referred to the LaChapelle, Briggs and French patents, was in answer to a question which inquired whether the mechanisms of those patents were necessary to the success of the operation of the machine, and I did not understand that that question involved the question of mere operativeness of the machine of patent No. 412,704.

Cross-Int. 249. Very well; what do you say now? If a machine were constructed as set forth in patent No. 412,704 without having incorporated in it the mechanisms of other patents you have referred to, would such a machine be a successful commercially operative machine?

Mr. PHILLIPS. Question objected to as calling for mere guesswork on the part of the witness, it not appearing that he ever saw a machine so constructed or had an opportunity to observe its operation.

Mr. WEBSTER. Counsel for the petitioner respectfully calls the attention of the court to the fact that this witness has qualified, or, at least, attempted to qualify, as an expert with reference to patents and operative mechanisms, and therefore it is respectfully submitted that the question is competent in every respect.

Mr. PHILLIPS. The witness has already testified that the machine

of that patent would be an operative machine for the purpose of sewing a welt and upper to the insole of a welt shoe.

Ans. I can only state that I have never seen a welt and turn machine of 1899 which did not embody in its organization the mechanisms set forth in the LaChapelle patent No. 488,505, Briggs patent No. 518,911 and French patent No. 561,386. I know that the mechanisms set forth in those later patents are very useful in the machine and I am certain that no customer of the United Company would have accepted at any time since February, 1899, the welt and turn machine of 1899 which did not embody in its organization the improvements of those patents.

Cross-Int. 250. When you refer in your last answer to mechanisms of the three patents 488,505, 518,911 and 561,386, do you mean the mechanisms claimed in those patents?

Ans. Yes, sir.

Cross-Int. 251. Does the mechanism claimed in the LaChapelle patent No. 488,505, December 20, 1892, affect the operation of the mechanism of patent 412,704, which, as I understand you to say, is adapted for carrying out the Briggs method?

Ans. Yes, sir, in so far as it affects the operation of the tension mechanism of the machine of French and Meyer patent No. 412,704.

Cross-Int. 252. And is the mechanism claimed in the LaChapelle patent referred to necessary to the successful carrying out of the Briggs method as defined in patent 412,704?

Ans. As I have stated, I consider that the mechanism of the LaChapelle patent No. 488,505 is important to the commercial success of the welt and turn machine of 1899; but I will state that I do not understand that the incorporation of the LaChapelle improvement in the machine of patent No. 412,704 affected in any way the practice of the Briggs method by the machine shown in that patent.

Cross-Int. 253. Do you make the same answer with reference to patent No. 518,911, Briggs?

Ans. Yes, sir; with the addition that the practice of the Briggs method by the machine shown in French and Meyer patent No.

412,704 was, undoubtedly, facilitated by the improvement set forth in the Briggs patent No. 518,911.

Cross-Int. 254. Referring now to Briggs patent No. 518,911, if the plunger *d* is fixed in position, will the device then be such a device or mechanism as is referred to in the claims of that patent?

Ans. No, sir; in my opinion, it would not.

Cross-Int. 255. You were knowing to the fact, were you not, when you testified in direct examination that patent No. 412,704 had been held by the courts to have expired September 17, 1902?

Ans. Yes, sir.

Cross-Int. 256. So that the live patents applicable to the welt and turn machine of 1899 were, after September 17, 1902: —

Patent of LaChapelle No. 488,505.

Patent of Briggs No. 518,911.

Patent of French No. 561,386.

Patent of Cole No. 495,452.

Patent of French and Meyer No. 732,729.

Kindly state if I am correct.

Ans. That list will be correct with the addition of patent No. 461,793, October 20, 1891, Briggs.

Cross-Int. 257. You did not mean by your last answer that there is any mechanism of the Briggs patent incorporated in the welt and turn machine of 1899, did you?

Ans. No, sir; but that machine in its operation practiced the method defined in the claim of the Briggs patent No. 461,793.

Cross-Int. 258. Specify which one of the patents, as applying to the welt and turn machine of 1899, was alive at the date of the filing of the petition herein?

Ans. Patent No. 561,386, June 2, 1896, French.

Patent No. 732,729, July 7, 1903, French and Meyer.

Cross-Int. 259. Now, taking up the first wax pot patent, is that essential to the successful operation of the welt and turn machine of 1899?

Ans. Probably not.

Cross-Int. 260. Is the mechanism claimed in the patent to

French No. 561,686 essential to the successful commercial operation of the welt and turn machine of 1899?

Mr. PHILLIPS. Question objected to because the witness has already stated that he never saw a machine operated without this mechanism.

Ans. As I explained in detail in the early part of my testimony relating to shoe machine, Goodyear welt and turn, the improvement of patent No. 561,386, June 2, 1896, French, contributed substantially to the successful commercial operation of the welt and turn machine of 1899 and overcame serious difficulties which had been experienced in the commercial use of welt-sewing machines before this improvement was made. As I have stated, I have never seen one of the welt and turn machines of 1899 which was not provided with this improvement, and I am confident that no customer of the United Company would have used one of those machines without the advantages secured by this improvement.

Cross-Int. 261. In speaking of the improvement of patent No. 561,386 in your last answer, do you mean the improvement defined in the claim of that patent?

Ans. Yes, sir.

Cross-Int. 262. Did you ever see a welt and turn machine of 1899 in which the looper carrier was intermittently put in contact with the heated block or plate?

Ans. I never saw one in which it was not.

Cross-Int. 263. In answer to question 10 you say, among other things, that you have examined the welt and turn sewing machine No. 228, illustrated in plaintiff's photograph Exhibit 232, at the factory at Whitman, Massachusetts, and that you find that machine embodies the means set forth in the claim of this French patent No. 561,386, June 2, 1896; are you still of the opinion that the mechanism of the machine referred to, No. 228, is so constructed and arranged that the heater block or plate comes in actual contact with the looper mechanism?

Mr. PHILLIPS. Question objected to as absolutely immaterial.

Ans. The claim of patent No. 561,386 calls for means to move the looper carrier "to put it in contact intermittingly with the said

heated block or plate". In my opinion, the machine No. 228 at the Whitman factory of the Commonwealth Shoe & Leather Company operates as called for by that claim.

Cross-Int. 264. Did you turn the machine over when you examined it; that is, did you revolve the shaft so as to put the mechanism in operation?

Ans. No, sir; the machine was being used and I observed it during its operation.

Cross-Int. 265. Now, if the looper carrier is not brought in actual contact intermittingly with the heater block, then the mechanism is not such as is referred to in the claim of the patent in question, is it?

Mr. PHILLIPS. This line of examination is objected to as trivial.

Ans. In my opinion, the claim of patent No. 561,386 would accurately describe an organization in which the looper or looper carrier moved near enough to the heated block or plate to be heated by it, whether or not the looper carrier was moved actually into contact with the heated block or plate.

Cross-Int. 266. Are you familiar with the case of United Shoe Machinery Company *v.* Greenman, reported in 146 Fed., page 759, in which patent No. 561,386 was passed upon by the court?

Ans. My attention has not been called to that case for several years, so I cannot say that at this time I am familiar with the case.

Cross-Int. 267. I desire to be perfectly fair with you, and I therefore inquire whether you would like to examine that case and state whether you wish to change your testimony in any respect after such examination?

Ans. I shall be glad to examine that case and shall certainly wish to change any testimony I have given if I find that to be incorrect.

Cross-Int. 268. Will you kindly state whether any of the welt and turn machines of 1899 have been returned to the United Shoe Machinery Company by the lessees?

Ans. Yes, sir; a great many.

Cross-Int. 269. State what has become of the machines so returned.

Ans. I cannot answer that question of my own knowledge, but

I have no doubt that, in accordance with the usual practice of the company when old machines are returned which have been replaced by improved machines, many of those old welt and turn machines of 1899 have been junked.

Cross-Int. 270. Can you ascertain and tell us about how many of the welt and turn machines of 1899 have been junked?

Ans. I do not know whether any record was kept, but I will endeavor to ascertain.

[*Adjourned to 10 o'clock* A. M., *Thursday, October 30, 1913.*]

BOSTON, MASS., October 30, 1913.

Cross-Int. 271. Have you prepared the data called for at the session yesterday with reference to the number of welt and turn machines of 1899 out at certain dates; and, if so, will you kindly spread the same upon the record?

Ans. I was requested to ascertain and state how many of the 1899 welt and turn machines were in use on January 1, 1908, and on the 1st of January in each succeeding year, to and including January 1, 1912; also, the number which are now in use. I find that the numbers of machines on the dates named which were in shoe factories were as follows: —

On January 1, 1908, there were 1914 of the welt and turn machines of 1899 in shoe factories.

On January 1, 1909, there were 1991.

On January 1, 1910, there were 1958.

On January 1, 1911, there were 1714.

On January 1, 1912, there were 1278.

On October 1, 1913, there were 739.

The date last named, October 1, 1913, is the last date for which it is convenient to state the number in use as the United Company's records are kept.

Cross-Int. 272. You have stated the numbers of welt and turn machines of 1899 in shoe factories; kindly state whether such machines, during the period inquired about, were also used in shoe repairing shops and places other than in factories.

Ans. I think they are used to some extent, but I am not advised

as to how many are in use in cobblers' shops. Such machines as are in use in cobblers' shops were, however, put out by the United Shoe Repairing Machine Company.

Cross-Int. 273. And is the United Shoe Repairing Machine Company one of the branches of, or under the dominion of, the United Shoe Machinery Company?

Ans. The United Shoe Repairing Machine Company is controlled by the United Shoe Machinery Company.

As to the other requests for information: first, as to whether the welt and turn sewing machines of 1899 which have been returned to the United Shoe Machinery Company by its customers have been junked, and as to whether the Goodyear Shoe Machinery Company which was putting out the welt and turn sewing machine of 1899 prior to February, 1899, was organized under the laws of Maine or Connecticut, I will produce that information at a later session.

Cross-Int. 274. Does the model G welt and turn machine do any better work, that is, sew any better seam, than the welt and turn machine of 1899?

Ans. No, sir.

Cross-Int. 275. Model G welt and turn machine is the machine that went into commercial use in October, 1908, as I understand it; am I correct?

Ans. Yes, sir.

Cross-Int. 276. And now, to get the data all together, will you kindly state when the model K welt and turn machine went into commercial use?

Ans. In June, 1911.

Cross-Int. 277. Does the model K welt and turn machine do any better work, that is, make any better stitch, than the welt and turn machine of 1899?

Ans. The model K machine does not make any better seam than the welt and turn machine of 1899.

Cross-Int. 278. As I recollect your direct testimony, you stated that the model G and the model K welt and turn machines had a capacity of 500 stitches per minute; am I right in my understanding?

Ans. Yes, sir; that is the speed at which those machines are regularly run in shoe factories.

Cross-Int. 279. Do you say that the capacity of a machine to do the work is dependent upon the number of stitches per minute it is capable of making?

Ans. No, sir; I don't say that, because the capacity of a machine is also largely dependent upon the facilities which it affords the workman for its convenient operation, and upon the presence or absence in its organization of means which decreases the time during which the machine is necessarily idle. I do say, however, that the speed at which a machine operates has an important bearing upon its capacity, because obviously a machine running at higher speed will do more work while it is operating than a machine running at a lower speed.

Cross-Int. 280. Would you say that if the welt and turn machine, models G and K, had a capacity of 3000 stitches per minute, more work could be done on those machines by the ordinary operative than with the machine running at 500 stitches per minute?

Mr. PHILLIPS. Question objected to as purely hypothetical and based on nothing touched upon in the direct examination of the witness, and calling for absurd and impracticable speed of operation.

Ans. As those machines are at present organized, I doubt whether an operator could present a shoe properly for the operation of the machine run at as high a speed as 3000 stitches per minute.

Cross-Int. 281. Then it is a fact, is it not, that the capacity of a welt and turn machine cannot be determined by the number of stitches per minute only; am I correct?

Mr. PHILLIPS. Question objected to as being mere repetition of a former interrogatory which the witness has fully answered.

Ans. I think that my second preceding answer fully answered this question, although I shall be glad to express my opinion again if desired.

Cross-Int. 282. Can you answer that by yes or no?

Mr. PHILLIPS. The witness is instructed that he is not obliged

to give a categorical answer to the question, but may state such explanation as he deems proper.

Ans. As I have previously stated, the capacity of a welt and turn machine cannot be determined by its speed alone, because the conveniences afforded to the operator in his use of the machine and provision in the organization of the machine for reducing the time during which the machine is idle in the course of the day have an important bearing upon the capacity of the machine. I repeat, however, that it is obvious that while the machine is operating it will do more work as the speed is increased.

Cross-Int. 283. Are you willing to state whether, so far as you know, the introduction of the models G and K welt and turn machines has resulted in lessening the cost of manufacture of shoes?

Mr. PHILLIPS. Question objected to as vague and indefinite, it not appearing what kind of shoes are referred to.

Ans. As regards the model G machine, when operators are paid by the day the increased capacity of the machine will obviously result in a saving to the manufacturer. When the operator is paid according to the number of shoes which he sews, there are two elements to be considered in figuring the saving to the manufacturer. If the operator is paid less per pair of shoes on the machine having the greater capacity, the manufacturer will effect a saving, while in any event there will be some saving in capital expense owing to the fact that a less number of machines having the greater capacity will be needed for a given daily output, and less factory space and less power will be required.

As regards the model K machine, the foregoing statements will apply in greater degree to that machine, owing to its increased capacity over the model G machine, and, furthermore, as I have previously testified, that machine effects a saving to the manufacturer of not less than one-quarter of a cent per pair of shoes in his welting.

Mr. WEBSTER. Answer objected to as not responsive, as evasive and argumentative, and counsel for petitioner moves that the same be stricken from the record, excepting as to that portion in which

the witness states that there is a saving in the use of the model K machine in the cost of welting.

Cross-Int. 284. Will you kindly examine the shoe I now hand you, and state whether it is a plain, ordinary welt shoe?

Ans. [*Witness examines shoe and says:*] That would appear to be a proper characterization of the shoe which was handed me for examination.

[*The shoe presented to and examined by the witness is offered in evidence, and is marked "Plaintiff's Exhibit 261".*]

Cross-Int. 285. How many pairs of shoes like Plaintiff's Exhibit 261 would you say could be sewed by an ordinary operative on a welt and turn machine of 1899 in a day of eight hours?

Ans. The number of shoes which an average operator of the welt and turn machine of 1899 will sew in a day of eight hours will vary greatly according to the kind of work and the rapidity with which the operator handles the shoe. The output of that machine as run by average operators will, accordingly, vary from, say, 250 pairs per day to a maximum of probably 500 pairs per day when conditions are favorable and the operator works rapidly.

Cross-Int. 286. In your direct testimony with reference to outsole stitchers and stitcher patents, in answer to question 23 (page 2275 of typewritten record) [printed page 2277] the first patent for a machine of this type was No. 127,423, June 4, 1872, Mills. Have you any information as to whether the sewing machine of the Mills patent of June 4, 1872, went into use and as to how long it was used commercially?

Ans. I understand that the machine which is shown substantially in the Mills patent No. 127,423, June 4, 1872, was put into commercial use and was used for a number of years.

Cross-Int. 287. In the same answer you refer to patent No. 253,156, dated January 31, 1882, Campbell, and you say: "The machine shown in that patent was commercially used for sewing out-soles to welts for many years." Kindly state, so far as you are able, for how many years the machine of the Campbell patent of January 31, 1882, was commercially used.

Ans. I think that machine was used for attaching out-soles to welts for at least eight or ten years.

Cross-Int. 288. In referring to welt and turn machines, you designated a certain machine made under certain patents as the "welt and turn machine of 1899", and for convenience I ask you whether it will be convenient to designate the out-sole stitcher which was in use in 1899 as the "stitcher of 1899"?

Ans. Yes; it will be entirely convenient to refer to that machine as the "Goodyear out-sole lockstich machine of 1899".

Cross-Int. 289. Can you state whether the machine for attaching out-soles to welts manufactured and put out, as you say, commercially as shown in patent to Campbell of 1882, was the commercial machine up to the time of the adoption of the machine constructed and operating as shown in patent No. 473,870, April 26, 1892?

Ans. It was not the only commercial machine, as many manufacturers were using a chain-stitch machine for attaching out-soles to welts. Prior to the introduction of the machine shown substantially in patent No. 473,870, April 26, 1892, French and Meyer, that is, the Goodyear out-sole lockstitch machine of 1899, both that chain-stitch machine and the machine of Campbell patent No. 253,156, January 31, 1882, had been superseded by the machine of patent No. 366,935, July 19, 1887, Dancel.

Cross-Int. 290. Will you kindly state by whom, so far as you know, the several machines referred to, viz., the machine put out under the Mills patent of 1872, the machine put out under the Campbell patent of 1882 and the machine put out under the Dancel patent of 1887, were put out; that is, sold or leased?

Mr. PHILLIPS. Objected to as having no relation to any matter referred to by this witness in his direct examination and as the witness cannot be assumed to have any knowledge as to the matter inquired about.

Ans. The machine of Mills patent No. 127,423, June 4, 1872, and the machine of Dancel patent No. 366,935, July 19, 1887, were put out by the Goodyear Shoe Machinery Company or its predecessors in business.

Cross-Int. 291. Well, who were the predecessors, if you know?

Ans. I could not tell you now. It is my understanding that the machine of Campbell patent No. 253,156, January 31, 1882, was put out by a company named The Campbell Machine Company or The Campbell Shoe Machine Company, or by its predecessors in business, but I could not state this positively without an investigation.

Cross-Int. 292. Kindly state when, so far as you are informed, the Goodyear out-sole lockstitch machine of 1899 manufactured as set out in patents 473,870, of 1892, and 474,774, of 1892, was put out first and by whom.

Ans. I cannot state accurately without investigation, but I think it was between 1890 and 1893 or 1894.

Cross-Int. 293. To save referring to detailed answer in direct examination, will you kindly state up to what time the Goodyear out-sole lockstitch machine of 1899 continued in use as a commercial machine?

Ans. The Goodyear out-sole lockstitch machine of 1899, with the improvements which I discussed in detail in my previous testimony which were incorporated in it from time to time, continued to be the standard out-sole lockstitch machine put out by the United Company until the adoption of lockstitch machine, Goodyear out-sole rapid, model K, which was first put out for commercial use in May, 1910.

Cross-Int. 294. Kindly state whether the Goodyear out-sole lockstitch machine of 1899 was ever put out without having incorporated in it the devices or alleged inventions of the four patents referred to by you in your direct examination, namely, French and Meyer, two patents, Nos. 563,471 and 563,472, of 1896; Shriner and Adams, No. 582,510, of 1897; and Meloon, No. 675,783, of 1901; and if you answer yes, state for how long a period of time such machine was in commercial use without having embodied therein the construction of said four patents, or any of them.

Ans. The Goodyear out-sole lockstitch machine of 1899, when it was first put out in the early nineties, was not organized as set forth in the four patents named. As explained in my previous

testimony, that machine was so organized about 1895. For several years after that time a portion of the Goodyear out-sole lockstitch machines of 1899 which were supplied to shoe manufacturers were not organized for operation upon extension edge shoes as set forth in the patents named, but as early as January 1, 1900, a greater number of mechanisms for organizing the machine for sewing extension edge soles were being supplied to manufacturers than the number of machines which were being supplied to manufacturers.

Cross-Int. 295. Would it be a convenient and proper designation to use hereafter, in reference to the four patents, to refer to them as "extension edge appliance patents", so as to avoid unnecessary repetition of numbers, titles, dates, etc.?

Ans. I believe I have used in my previous testimony the expression "extension edge mechanism", and for convenience it may be better to continue that expression in referring to the organization of an out-sole lockstitch machine which enables that machine to attach the out-soles of extension edge shoes.

Cross-Int. 296. Kindly state whether, so far as you know, any of the Goodyear out-sole lockstitch machines of 1899 were in use as late as the early part of 1908 without having incorporated in them any of the mechanisms referred to as "extension edge mechanism"?

Ans. I believe there were a few Goodyear out-sole lockstitch machines of 1899 still in use as late as 1908 which were not organized for operation upon extension edge soles, although I understand that shortly after that time all of the Goodyear out-sole lockstitch machines of 1899 were so organized.

Cross-Int. 297. Do you know, and, if so, will you state, the capacity of the Goodyear out-sole lockstitch machine of 1899 when constructed without the extension edge mechanism, and when being operated by the ordinary average operator in a day of eight hours, and when operating, for instance, upon shoes substantially like Plaintiff's Exhibit 261?

Ans. I have no means of judging as to the capacity of the Goodyear out-sole lockstitch machine of 1899 when not provided with extension edge mechanism, as I do not recall ever having seen one

of those machines in operation which was not provided with the extension edge mechanism.

Cross-Int. 298. Am I correct in my recollection that you testify that welting like that shown on the shoe marked "Defendants' Exhibit 106" costs the manufacturer six cents per running foot?

Ans. I understand that welting such as is used in welt shoes costs from about four cents to about seven cents per running yard, according to the quality of the welting and the type of shoe for which it is to be used. Including both men's and women's shoes, probably a fair average of the cost of welting would be five cents per running yard, although the cost of welting for men's shoes of good quality would be more.

Cross-Int. 299. Kindly state, as near as you are able, how many of the Goodyear out-sole lockstitch machines of 1899 were out, or, in other words, in use, on or about June 1, 1909, thus including the machines with and without the extension edge mechanism.

Ans. I have not the figures for June 1, 1909, but on March 1, 1909, there were out 2442 of the Goodyear out-sole lockstitch machines of 1899.

Cross-Int. 300. You have stated that extension edge mechanisms were incorporated in many of the Goodyear out-sole lockstitch machines of 1899; will you kindly state whether the machines of 1899 were returned to the factory in order to have the attachments applied, or whether the attachments were applied at the shoe factories where the machines were in use?

Ans. It was the usual practice, where a manufacturer desired to organize for operation upon extension edge shoes a Goodyear outsole lockstitch machine of 1899 which he had and which was not so organized, to incorporate the mechanism in the machine in his factory.

Cross-Int. 301. In your direct testimony with reference to rough rounders and channelers you made reference to the rough rounder and channeler of the patent to Briggs No. 463,982, dated November 24, 1891; kindly state, if you know, whether the machine constructed and operating as set forth in that patent went into use, and, if so, when it first went into use and by whom it was put out.

Ans. As stated in my previous testimony, the machine of patent 463,982, November 24, 1891, Briggs, was not put into commercial use.

Cross-Int. 302. From what source do you get your information that the machine of the patent of 1891 referred to did not go into use?

Ans. I have compared that patent with the machine known as "Briggs rounding machine", which was a commercial machine at one time.

Cross-Int. 303. And is that the whole source of your information?

Ans. Perhaps it will answer the question if I state that that patent No. 464,982, of November 24, 1891, was owned by the Goodyear Shoe Machinery Company, and I know that the Goodyear Shoe Machinery Company did not put out a commercial machine constructed as shown in the drawings of that patent.

Cross-Int. 304. You say, in one of your answers to rough rounding and channeling machines, as I understand your answer, that the mechanism of patent 463,982, November 24, 1891, Briggs, represents a step in the development of the machine which was known as "Briggs rounding machine", the commercial form of which is shown in patent No. 511,263, December 19, 1893, Briggs and Dancel, and that that machine was put out for a time. Will you kindly state by whom the machine you refer to was put out, when it was put out, and for how long a time it was in use, so far as you know?

Ans. The Briggs rounding machine was first put out by the Goodyear Shoe Machinery Company within a year or two after 1890. It was put out until about 1896, when it was superseded by the machine now known as "rounding and channeling machine, Goodyear Universal".

Cross-Int. 305. Can you state how many of the Briggs rounding machines such as referred to in the question and answer were put out?

Ans. About 200.

Cross-Int. 306. Will you now, if you have the data at hand,

answer the questions submitted to you yesterday as to the number of welt and turn machines of 1899 which were "junked", and also as to the laws of what State under which the Goodyear Shoe Machinery Company to which you referred was organized?

Ans. Between October 18, 1908, and October 30, 1913, the United Shoe Machinery Company "junked" 1315 of the welt and turn sewing machines of 1899.

The Goodyear Shoe Machinery Company was organized in 1889 under the laws of the State of Connecticut. That company was reorganized in 1893 under the laws of the State of Maine with the name "Goodyear Shoe Machinery Company".

Cross-Int. 307. By the term "junked" as used by you, am I correct in understanding that it means broken up and destroyed?

Ans. Yes, sir.

Cross-Int. 308. Referring now to your testimony with reference to insole channelers, have you any personal knowledge as to the condition of the machine No. 2072 leased to the Commonwealth Shoe & Leather Company?

Ans. Yes, sir, I have personal knowledge that the machine which was leased to the Commonwealth Shoe & Leather Company by the Goodyear Shoe Machinery Company on February 8, 1893, did not embody the improvements shown in the drawings and set forth in the claims of patent No. 550,402, November 26, 1895, Beckman, because those improvements had not been made and the mechanism embodying them did not exist in February, 1893.

Cross-Int. 309. How do you know personally, and of your own knowledge, that such mechanism did not exist in 1893?

Ans. My knowledge as to this fact is based upon many sources of information, among which is the fact that the application for that patent No. 550,402 was filed on April 17, 1895, which is more than two years after February 8, 1893.

Cross-Int. 310. And do you, a lawyer, consider that you are justified in stating a fact of your own knowledge when your information is founded upon a printed or written document executed by someone else?

Ans. I did not state my knowledge was based solely upon the

information obtained from the Beckman patent, but stated that my knowledge was acquired from many sources, and I might add that I also have personal knowledge of the fact that after the Beckman improvements had been produced they were incorporated in most, if not all, of the insole channeling machines which had been put out by the Goodyear Shoe Machinery Company before the Beckman improvements were made.

Cross-Int. 311. Were you ever in the employ of the Goodyear Shoe Machinery Company?

Ans. No, sir.

Cross-Int. 312. Have you, or did you have, personal knowledge of the business and affairs of that company in 1893?

Ans. No, sir.

Cross-Int. 313. Then, is it not a fact that your information with reference to the fact inquired about is obtained solely and only from statements made by others?

Ans. As further evidence as to the construction of the insole channeling machine, and as to the condition of that machine when it was leased to the Commonwealth Shoe & Leather Company on February 8, 1893, I refer to the cut on page 95 of Plaintiff's Exhibit 220, being the Goodyear Shoe Machinery Company catalogue of January 1, 1897. That cut shows the machine in the condition in which it was leased in February, 1893.

Cross-Int. 314. Did you have anything to do with getting up the cut or illustration referred to by you?

Ans. No, sir.

Cross-Int. 315. Did you ever see the machine from which the cut was made?

Ans. I have seen a machine like that cut, which was shipped to my office from the "museum" at the United Company's Beverly factory, but I have no reason for believing that this cut was made from that particular machine which I have seen.

Cross-Int. 316. Is it your understanding, as a lawyer, that the information you have given the court as to your source of information entitles you to testify to the facts inquired about as of your own knowledge?

Mr. PHILLIPS. Objected to as improper cross-examination, the opinion of the witness on this matter being absolutely immaterial.

Ans. I am confident that all of my testimony in this connection is absolutely correct.

Cross-Int. 317. Is that the best answer you care to make to the question?

Ans. I can only add that I have stated what I know to be facts.

Cross-Int. 318. Will you kindly state whether, so far as you know, the machine illustrated on page 95 of Plaintiff's Exhibit 220, the same being entitled a "turn and insole channeling machine", was shown and described in any patent; and, if so, what patent?

Ans. I have not at hand now data which will enable me to answer this question, but shall be glad to bring it at the next session if desired.

Mr. WEBSTER. Kindly do so.

Cross-Int. 319. Can you state from such information as you have whether the channeling machine illustrated on page 95 of Plaintiff's Exhibit 220 was used commercially for any period of time. And, if so, kindly state how long and by whom it was put out.

Ans. I think the machine had been put out for some years prior to the date when machine No. 2072 was leased to the Commonwealth Shoe & Leather Company, that is, February 8, 1893, but I cannot state for how long a period it had been put out. It was put out by the Goodyear Shoe Machinery Company.

Cross-Int. 320. I observe that in your direct testimony with reference to out-sole channelers you say (page 2352 of typewritten record) [printed page 2330]: "The Goodyear out-sole channeler is a very old machine, which, when it was active, was used for channeling the out-soles of welt shoes." Will you kindly state whether the Goodyear out-sole channeler referred to by you in that language was shown and described in any United States patent; and, if so, what patent? And in this connection, to save encumbering the record, I wish you would state for how long the Goodyear out-sole channeler was "active".

Ans. I have not at hand the data which will enable me to answer this question fully, and can only state that the Goodyear out-sole channeler became inactive soon after the introduction of rounding and channeling machine, Goodyear Universal, about 1896. There is no place for the Goodyear out-sole channeling machine in the manufacture of welt shoes according to modern methods.

Cross-Int. 321. Can you ascertain, without undue inconvenience, whether the Goodyear out-sole channeler referred to was ever covered by patent; and, if so, will you kindly do so and testify to the fact at the next session?

Ans. I shall be glad to.

Cross-Int. 322. You have testified at some length with reference to leveling machines, and I gather from your direct testimony that the Goodyear automatic leveling machine, constructed as shown in patent to Winkley and another, No. 540,222, May 28, 1895, was an important step in advance. Will you now kindly state what type of leveling machine was in use prior to the production of the machine of the patent referred to?

Ans. The leveling machine which was used for leveling welt shoes prior to the introduction of the Goodyear automatic leveling machine was a vibrating roll machine in which the operator controlled by hand, during the operation of the machine, the relative inclination of the jack and the roll as required for leveling different parts of the sole. Each such machine contained only one roll and one jack, while, as I have explained, the Goodyear automatic machine comprises two rolls and two jacks, and the machine automatically levels one shoe while the operator is removing from the machine a shoe previously leveled and is substituting another shoe to be automatically leveled by the machine while he is removing from the machine the shoe first referred to. In some factories one operator runs two machines, comprising four pairs of jacks and rolls.

Cross-Int. 323. In order to avoid unduly extending the record I will ask you if you are willing to give the court the benefit of your knowledge and research with reference to leveling machines, and state in a general way what leveling machines were in use prior to

the date of the patent referred to, 1895, by whom they were put out, how extensively they were used, so far as you know, and whether they formed the subject-matter of any patent; and, if so, what patent?

Mr. PHILLIPS. Objected to as improper cross-examination.

Ans. Referring, first, to leveling machines of the vibrating roll type intended or adapted for use on welt shoes, the first patent of which I am aware showing a machine of this type is No. 44,946, Gilmore, November 8, 1864. It may be of interest to quote the second claim of this patent, which is as follows: —

"2. So arranging the jack carriage and the mechanism which impels the polisher that the polisher has a reciprocating movement but partially over the surface to be polished, while the carriage is fed through this plane of movement substantially as described, to bring the entire length of surface to the action of the polisher."

The "polisher" of this claim is a vibrating leveling roll. Prior to the Gilmore patent, No. 44,946, had been granted a patent No. 38,257, April 21, 1863, Budding, but in the machine of that patent the leveling roll was given a continuous reciprocating movement over the entire length of the sole, as distinguished from the short vibrating movement back and forth over a limited portion of the sole, as in the machine of the Gilmore patent No. 44,946 and as in the Goodyear automatic sole leveling machine of the present day. I understand that machines constructed substantially as shown in the drawings of Gilmore patent 44,946 were commercially used, but at all events machines constructed substantially as shown and described in patent No. 266,283, October 24, 1882, Gilmore, were commercially used to a considerable extent. In that machine the oscillation of the jack or work support to move the shoe in order to present the different portions of the sole to the action of the vibrating roll was effected by power.

The next machine of the vibrating-roll type which was supplied to manufacturers is shown in patent No. 403,495, May 14, 1889, Strong. This machine was really an improvement upon and development of the machine of Gilmore patent No. 266,283, October 24, 1882.

I do not now recollect the names of the concerns which put out the first types of vibrating roll machines to which I have referred, but I believe that in February, 1899, the machine of the Strong patent No. 403,495, May 14, 1889, was being supplied to manufacturers by the Carver Cotton Gin Company. It was known as "Acme Leveling Machine", and was, as I am informed, the machine in general use for leveling welt shoes when the automatic leveling machine was first supplied to manufacturers, shortly before February, 1899.

There was another machine of the vibrating roll type which was being supplied to shoe manufacturers in 1899, known as the "Star Leveling Machine". That machine was constructed substantially as shown in patent No. 435,882, September 2, 1890, Washburn. That machine was much lighter than the Acme machine, and was adapted and used for leveling turn shoes. I believe that machine was supplied to manufacturers by the Swain, Fuller Manufacturing Company. As I have explained in detail in my previous testimony on page 2711 of typewritten record [printed page 2579], it is not practicable to use a leveling machine of the vibrating roll type in leveling McKay sewed, nailed or pegged shoes, and in the portion of my testimony to which I have just referred the reasons why a vibrating roll leveling machine is not practicable for use on those classes of shoes were stated fully. It was also explained that it is, and always has been, the universal practice in leveling McKay sewed or nailed shoes to employ machines having iron lasts or jacks to support the shoe and co-operating pressing forms for imparting pressure to the sole, the machines in which such iron lasts and pressing forms were used being organized to impart pressure to the sole in a direction substantially perpendicular to the face of the sole.

I further explained that machines for leveling McKay sewed and nailed shoes are of two types, known as "rolling pressure type" and "direct pressure type", and in the portion of my testimony relating to leveling machine, Hercules, and leveling machine, Atlas, I explained that machines of these two types have different

fields and are adapted for use on different kinds or types of McKay sewed and nailed shoes.

The first patent of which I am aware disclosing a leveling machine of the rolling pressure type is No. 96,638, November 9, 1869, Tripp. It may be of interest to note the first claim of this patent, which is as follows:—

"1. The combination, with a last, arranged to oscillate as described, of a former, oscillating in unison therewith, and against the face thereof, and provided with a longitudinal convexity, fitting the hollow of the last when oscillating thereon, and concavities at the ends, fitted to work upon the heel and toe of the said last, substantially as specified."

The machine of the Tripp patent which was manually operated was commercially used, as I am informed. That machine was improved and developed into the leveling machine disclosed in patent No. 296,486, April 8, 1884, Tripp. It is my understanding that the machines of both Tripp patents were supplied to manufacturers by the Tripp Giant Leveler Company or by its predecessors in business.

The machine of the Tripp patent No. 296,486 was further improved as shown in patent No. 707,414, August 19, 1902, Heys, and the machine of that patent, known as "New Giant Leveler", went into extensive commercial use.

The United Shoe Machinery Company did not, in February, 1899, supply to shoe manufacturers any leveling machines of the rolling pressure type, nor did any of its predecessors supply such a machine just prior to February, 1899. As fully explained in my previous testimony in regard to leveling machine, Hercules, the first machine of this type which was built and put out by the United Company, and, in fact, the first leveling machine of any type which the United Company constructed and put out for use in leveling McKay sewed or nailed shoes, was put out in April, 1903, and the machine as then put out, and as subsequently improved from time to time, has been known as "Leveling Machine, Hercules".

[*Adjourned to 10 o'clock* A. M., *Friday, October 31, 1913.*]

BOSTON, MASS., October 31, 1913.

[*Answer to Cross-Int. 323 continued:*]

All leveling machines of the rolling pressure type which were in use before the introduction of the Hercules leveling machine were open to the objection that after they had been used a short time they were likely to tear the wide, thin channel lips of the soles on which they operated. This difficulty was entirely obviated in the Hercules leveling machine.

As to the direct pressure type of leveling machines, the first patent of which I am aware showing a machine of the direct pressure type is patent No. 71,495, November 26, 1867, Johnson. The machine of that patent was improved as shown in patent No. 75,428, March 10, 1868, Johnson. The machine of the first Johnson patent, No. 71,325, was put out to a limited extent by the patentee, Johnson. The machine of the second Johnson patent, No. 75,428, March 10, 1868, was put out extensively by the Swain, Fuller Manufacturing Company.

The next step in the development of direct pressure leveling machines is illustrated in patent No. 118,185, August 22, 1871, Blaney. So far as I can learn, only a few machines constructed as shown in this Blaney patent were put into commercial use.

Patent No. 141,058, July 22, 1873, Johnson, illustrates an improvement in the Johnson machine as put out by the Swain, Fuller Manufacturing Company. The machine of patent No. 141,058, July 22, 1873, was a double machine comprising two pairs of co-operating pressing forms and iron lasts.

In the machines of the direct pressure type as constructed under the patents already referred to there was no convenient means for adjusting the relative positions of the pressing form and last to adjust them approximately in accordance with varying thicknesses of work. Manually adjustable pressing forms were first disclosed in patent No. 164,363, June 15, 1875, Collyer, which discloses a gang machine of the rotary type. A later development in this direction is represented by patent No. 230,187, July 20, 1880, Johnson. This patent shows a machine provided with two pairs of

pressing forms and iron lasts and a machine constructed substantially as shown in this patent No. 230,187, but provided with six pairs of lasts and jacks, was put out extensively by the Swain, Fuller Manufacturing Company.

The next step in the development of direct pressure leveling machines is disclosed in patent No. 384,893, June 19, 1888, Cutcheon. The distinctive characteristic of this machine was provision for moving one of the iron lasts into pressing position simultaneously with the movement of the other last away from the pressing form into position of presentation. It may be of interest to note the first claim of this Cutcheon patent No. 384,893, which is as follows: —

"1. A machine for beating out the soles of boots and shoes, provided with two jacks, two molds, and means, substantially as described, having provision for automatically moving one jack in one direction while the other is being moved in the opposite direction, whereby the sole of the shoe upon one jack will be under pressure while the other jack will be in a convenient position for the removal of the shoe therefrom."

The machine of this Cutcheon patent 384,893 was supplied to manufacturers by the Tripp Giant Leveler Company, or by its predecessors in business.

As I have already indicated, the earlier machines of the direct pressure type had no provision for adjustment in accordance with varying thicknesses of the stock, that is, the combined thickness of the insole and out-sole, while the machines commercially used, beginning with the machine of Collyer patent No. 164,363, June 15, 1875, were provided with means for manually adjusting the relative position of the iron last and the pressing form. This manual adjustment, however, adapted the machine only approximately for its operation upon varying thicknesses of stock, and the adjustment was largely, and perhaps entirely, a matter of guesswork on the part of the operator. The first patent disclosing a machine which was adjusted automatically to varying thicknesses of work, and then exerted uniform pressure upon the sole of the shoe irrespective of its thickness, was No. 557,744, April 7, 1896, Winkley. This improvement was an important advance in the art, as all direct pressure leveling machines in use up to that time

had exerted different degrees of pressure upon stock of different thicknesses, frequently imparting enough pressure to thicker stock to injure the sole and often imparting insufficient pressure to thinner stock so that the sole did not receive enough pressure to level it properly. As has been explained in my previous testimony, the United Company's leveling machine, Atlas, embodying mechanism defined in broad terms in the Winkley patent No. 557,744, April 7, 1896, is shown substantially as it was first put into commercial use in patent No. 818,504, April 24, 1906, Winkley.

In the earlier part of this answer I have stated that the Star leveling machine constructed substantially as shown in patent No. 435,882, September 2, 1890, Washburn, was used for leveling turn shoes. This machine, which was known in the industry as "the man killer", was superseded by the United Company's leveling machine, Goodyear welt and turn (turn work), which, as stated in my previous testimony in regard to that machine, was first put into commercial use in June, 1906, and is shown substantially as it was first put out in patent No. 1,004,155, September 26, 1911, Eppler (application filed May 3, 1906).

Cross-Int. 324. Do the terms "leveling machine", "laying machine" and "beating machine" relate to the same general type or class of machines; that is, are they all designed for shaping the sole?

Ans. A sole-laying machine is used in the manufacture of welt shoes for pressing upon the bottom of the shoe the sole, to the flesh side of which has previously been applied a coating of cement. The object of this operation is to secure the sole temporarily in position during the rounding and channeling and the out-sole stitching operations. Such shaping as is imparted to the sole during this operation is chiefly, and perhaps only, for the purpose of getting approximately all of the flesh side of the sole into contact with the bottom of the shoe and any effect which this machine has upon the final shaping of the finished sole is negligible; in fact, it is customary to "mold" soles before they are laid, to give them a contour approximating that of the bottom of the last, to facilitate the laying.

The leveling operation, as has been fully explained in my previous testimony, is performed for the purpose of imparting the final face contour to the bottom of the sole after it has been secured to the shoe. Such machines are sometimes styled in the industry "beating out machines". The single word "beating" is probably too general to be applied to this operation, as it is also used to indicate other operations performed upon the shoe.

Cross-Int. 325. Then would it be proper to say that the machine of the Cutcheon patent dated June 19, 1888, No. 384,893, entitled "Beating Out Machine", the same being Plaintiff's Exhibit 191, is a leveling machine?

Ans. Yes, sir; the machine shown in the drawings of that patent is a sole-leveling machine.

Cross-Int. 326. And is a machine so constructed adapted also to be used as a laying machine?

Ans. Very likely it could be used as a sole-laying machine, and undoubtedly a machine embodying mechanisms set forth in the claims of that Cutcheon patent could be used for laying soles.

Cross-Int. 327. You have referred at some length to the automatic feature of some of the leveling machines, among which is the machine termed "Automatic Leveler" shown in Plaintiff's Exhibit 234, which, as I understand from your testimony, is the same as shown in the cut on page 28 of Plaintiff Exhibit 190, and I would like to inquire just what you mean by the term "automatic", that is, whether the machine stops within a predetermined period of time, or after a certain number of revolutions of a part of its mechanism, or whether its stopping period is determined by some other condition?

Ans. In the first place I beg to call attention to the fact that I have testified that the machine shown in Plaintiff's Exhibit 234 is not like the machine shown on page 28 of Plaintiff's Exhibit 190, being United Company's catalogue of 1902, because the work-supporting mechanism shown in Plaintiff's Exhibit No. 234 is substantially different from that illustrated in the cut on page 28 of Plaintiff's Exhibit 190.

As to the automatic operation of the Goodyear automatic sole-

leveling machine, the operation upon each shoe stops automatically after the machine has performed its operations successively upon different portions of the shoe; that is, at a predetermined time in the cycle of the machine's operations upon a given shoe the operation upon that shoe stops and the shoe is presented in a position for its convenient removal by the operator and the application of another shoe to be operated upon by the machine.

Cross-Int. 328. Then, if I understand you, in the operation of the machine referred to, after the driving mechanism has revolved a certain number of times the machine stops; am I correct in my understanding?

Ans. No, sir.

Cross-Int. 329. What makes the machine stop, or, in other words, is the stopping of the machine dependent upon the condition of the sole being operated upon, or is it dependent upon the number of operations performed by the machine on the sole?

Ans. The machine itself does not stop at the completion of the operation upon a given shoe. It would be more correct to state that the operation upon that given shoe stops. The stopping of the operation upon each shoe takes place after the machine has operated automatically in a predetermined way upon that shoe.

Cross-Int. 330. Perhaps we can get at it in this way: as I understand you, the leveling rolls that come in actual contact with the sole operate a certain number of times on a certain sized type and kind of shoe; am I right?

Ans. Perhaps that is correct in that one leveling roll operates upon one shoe once. During its operation upon that shoe it is continuously in engagement with the shoe, being vibrated rapidly over each portion of the sole successively, and automatically tipping as required to adapt it according to the varying face contour desired for each portion of the sole of the finished shoe.

Cross-Int. 331. And does the roll operate upon a soft sole a different number of times than it operates on a hard sole of the same size and shape?

Ans. No, sir; that condition is provided for by convenient adjustment to vary the amount of pressure.

Cross-Int. 332. Approximately, how long does it take to operate upon one sole with the machine referred to?

Ans. I do not remember that I have timed the operation of the machine, and should prefer to do that before stating the time required for one shoe. I should add, however, that the time required for each shoe would, of course, vary with the speed at which the machine was run.

Cross-Int. 333. Well, supposing you had a dozen pairs of shoes all of the same size and kind, some of them having soft soles and some of them having hard soles, the machine being operated on all without change of adjustment: then would the time employed in the operation on each of the soles be the same?

Ans. The conditions stated in the question are not the commercial conditions under which this machine operates in shoe factories. The machine is generally used in shoe factories on regular work in which a large number of shoes substantially alike as regards the quality of their soles are presented successively to the operation of the machine. As explained in my previous testimony in open court, it is not customary to level on this Goodyear automatic leveling machine either freak shoes or sample shoes.

Mr. WEBSTER. Answer objected to as not responsive, and evasive.

Cross-Int. 334. Does the condition of the sole as to hardness or softness have anything to do with the automatic stopping of the portion of the machine which operates on the sole?

Ans. Yes, sir, in that the machine is organized to level the sole properly, and when it has done that its operation on that sole stops.

Cross-Int. 335. So that if a soft sole is presented to the machine immediately after a hard sole has been operated upon, and there has been no change in the adjustment of the machine, the time of the stopping of the portion of the machine operating on the soles differs; is that correct?

Ans. No, sir.

Cross-Int. 336. Would the time expended in operating on the two soles referred to in the previous question be the same?

Ans. Yes, sir.

Cross-Int. 337. Now, inviting your attention to your direct examination with reference to pegging machines, you say, among other things, that prior to February, 1899, pegging machines were used exclusively for attaching soles of boots or shoes by means of wooden pegs, and that the pegging machine of patent No. 555,434, February 25, 1896, was the first patent on what has since been known as a horn pegging machine, and that prior to the machine illustrated in the patent referred to it had been the universal practice in pegging shoes to insert the pegs while the last was still in the shoe; do you still adhere to that expression of your opinion of the art?

Ans. Yes, sir.

Cross-Int. 338. You also stated that this machine, referring to the Davey machine of patent of February 25, 1896, represented a great advance in the art over the prior machines, and, as I understand your testimony, that the horn tip of the Davey pegging machine of that patent first made it possible to peg shoes with a horn instead of a wooden last; do you still adhere to that statement?

Ans. Yes, sir.

Cross-Int. 339. Had you, at the time of testifying with reference to the pegging machine looked into the prior art with reference to pegging machines provided with horn tips for the purpose of pegging without the employment of lasts in the machine?

Ans. I have had occasion to become somewhat familiar with the prior art in this connection.

Cross-Int. 340. And at the time of testifying were you familiar with the patent of Sturtevant and Bickford, dated February 15, 1897, No. 173,428, a copy of which I now hand you?

Mr. PHILLIPS. Question objected to as having no bearing on any matter touched upon in the direct examination of this witness, and being immaterial to any issue under the order of the court submitting this case to be heard by this examiner, and as being improper cross-examination.

Ans. Yes, sir.

Cross-Int. 341. Were you also familiar with, and had you exam-

ined, and did you understand, the various constructions set out in the following patents:—

Allen, channel cutting machine, February 19, 1889, No. 398,305;

Scott, sewing machine, October 19, 1880, No. 233,561;

Carey, machine for uniting soles and uppers, January 6, 1891, No. 444,126;

Carey, machine for uniting soles and uppers of boots and shoes, March 26, 1895, No. 536,183;

Ley, pegging machine, March 7, 1893, No. 492,906;

copies of which I now hand you?

Mr. PHILLIPS. Question objected to as having no bearing on any subject-matter opened upon the direct examination of this witness, as being improper cross-examination, and further objected to as immaterial to any issue triable before this examiner under the order of the court.

Ans. I cannot state that I have examined any constructions set out in the patents referred to, but I was familiar with the patents. As I recall these patents, only one of them relates to a machine for inserting wooden pegs. That is patent No. 492,906, March 7, 1893, Ley. The Allen patent, No. 398,305, and the Scott patent, No. 233,561, relate to sewing machines; and the two Carey patents, Nos. 444,126 and 536,183, relate, as I recall them, to "machines principally used for securing together soles and uppers of boots and shoes or for attaching the uppers thereof and stitching harness, belting, and the like, by a seam composed of a continuous thread of wire in loops and short lengths of wire or other like material inserted in the same". (Specification of Carey patent No. 536,183, page 1, lines 12 to 19.)

As regards the Ley patent No. 492,906, March 7, 1893, as well as the Sturtevant and Bickford patent 173,428, February 15, 1876, the latter of which was inquired about in the preceding question, these patents serve to indicate that during a period of at least twenty years preceding the production of the first type of Davey horn pegger, the desirability of pegging shoes "off the last" and avoiding the great expense explained in my preceding testimony, was fully recognized. So far as I know, no machines constructed

as shown in either of these patents were ever put into commercial use, and, as I have previously stated, the first commercially successful horn pegging machine, that is, the first machine for pegging shoes "off the last", was the machine embodying the construction set forth in patent No. 555,434, February 25, 1896, Davey.

[*Patents shown to the witness are offered in evidence in one volume, and are marked "Plaintiff's Exhibit 262".*]

Mr. PHILLIPS. The introduction of these patents is seasonably objected to on the ground that they are improperly offered on the cross-examination of this witness and are of no materiality to any issue triable before this examiner under the order of the court.

Cross-Int. 342. Were you aware at the time of testifying, or are you now aware, that the patent to Davey No. 555,434, dated February 25, 1896, pegging machine, had been passed upon and construed by the court?

Ans. Yes, sir, I was aware of the fact at the time I testified.

Cross-Int. 343. And were you familiar with the decision in the case of Davey Pegging Machine Company *v.* Isaac Prouty & Company et al., reported in 96 Fed. Rep., page 336?

Ans. I have been familiar with the decision, although my attention has not been called to it for several years.

Cross-Int. 344. And also with the decision in the same case in the Court of Appeals, reported in 107 Fed. Rep. 505?

Ans. My preceding answer will apply to this question.

Cross-Int. 345. Do you know whether Isaac Prouty & Company were in business prior to 1899?

Mr. PHILLIPS. Objected to as improper cross-examination, referring to no matter brought out in the direct examination of this witness.

Ans. I think they were.

Cross-Int. 346. And do you now say that it is not clearly shown in the Sturtevant and Bickford patent of 1876 that the machine therein shown was adapted to drive pegs and cut off their ends inside the shoe, and without the employment of a last?

Mr. PHILLIPS. Question objected to as relating to no matter re-

ferred to in the direct examination of this witness and pertinent to no issue triable before this examiner.

Ans. I have not made such a statement and do not make it now. I have stated, and repeat, that, so far as I know, no machines were constructed and commercially used as illustrated in the Sturtevant and Bickford patent No. 173,428, although, as I have previously stated, that patent serves to indicate that as early as 1876 the desirability of pegging shoes "off the last" was recognized.

Mr. WEBSTER. All that portion of the answer after the words "I have not made such a statement and do not make it now" is objected to as not responsive, and evasive.

Cross-Int. 347. Is it your understanding that the claims of Davey patent No. 555,434, dated February 25, 1896, which patent has been referred to by you in your direct testimony, go broadly to a pegging machine wherein the projecting ends of the pegs are cut on the inside of the shoe at or about the same time they are driven?

Mr. PHILLIPS. The same objection.

Ans. No, sir; I should not give that construction to the claims, but should like to add that I understand that those claims are directed to the organization of the first practically successful machine for pegging shoes "on the horn".

Mr. WEBSTER. All that portion of the answer after "No, sir" is objected to as non-responsive, and evasive.

Cross-Int. 348. You say in one of your answers that according to Mr. Davey's records the machine at the Whitman factory is No. 76; when did you examine Mr. Davey's records?

Ans. Within two or three weeks before the day on which I made that statement in my testimony.

Cross-Int. 349. Where did you examine Mr. Davey's records?

Ans. In my office.

Cross-Int. 350. From whom did you procure them?

Ans. From Mr. Davey and a Mr. Hope, who was asssociated with Mr. Davey at the time that the pegging machine in question was sold to the Commonwealth Shoe & Leather Company.

Cross-Int. 351. Are the Davey records now in your possession?

Ans. No, sir.

Cross-Int. 352. Can you procure them and produce them here for examination and verification?

Mr. PHILLIPS. I instruct the witness that it will be unnecessary for him to procure such records until instructed so to do by counsel or by the court.

Ans. It will involve considerable inconvenience to obtain and produce the records to which I have referred, and I should prefer not to do so unless instructed by counsel or by the court.

Cross-Int. 353. Did you not know at the time you testified that you had no right to rely upon reeords and testify as to the same without producing such records in court?

Ans. I attached little importance to the number of the Commonwealth Shoe & Leather Company machine because I believe all of the machines supplied by John F. Davey embodying the mechanism of patent No. 555,434, February 25, 1896, were alike. I mentioned that number merely to indicate that the machine was apparently constructed at about the same time as the machine No. 79, which I had photographed, and photographs of which were introduced in evidence as Defendants' Exhibits Nos. 126 and 127. As a matter of fact, I consider the number of the machine at the Commonwealth Shoe & Leather Company's factory as immaterial, since I have testified as to the identity of that machine and the machine shown in Defendants' Exhibits Nos. 126 and 127.

Mr. WEBSTER. Answer objected to as not responsive, and evasive.

Cross-Int. 354. You also testified that the photograph which you produced of the machine at the Whitman factory showed accurately the machine as it was sold to the Commonwealth Shoe & Leather Company by Mr. Davey in 1895. Did you get any of that information from the Davey records?

Ans. I did not testify that the photograph of Defendants' Exhibit 126 was a photograph of the machine at the Whitman factory. I testified that it was a photograph of machine No. 79 and that I compared it with the machine at the Whitman factory. The ground for my testimony, therefore, was my personal examination

of the machine at the Whitman factory as well as of machine No. 79.

Mr. WEBSTER. Answer objected to as not responsive, and evasive.

Cross-Int. 355. You say: "The horn which was then on the machine and which is shown in this photograph is not now on the machine." Have you any personal knowledge as to what horn was on the machine in 1895?

Ans. I have every reason to believe that the horn which was on the machine in 1895 was the horn which was on a bench near the machine in the Whitman factory, or a horn like that such as was a part of machines like this as sold by Davey in 1895.

Mr. WEBSTER. Answer objected to as not responsive, and evasive.

Cross-Int. 356. You have testified that the five Chase lasters at Jones' factory were being used only for long-legged boots. Do you mean by that statement that they were used only for long-legged boots while you were present, or do you mean that they had not been used for any period of time on anything other than long-legged boots?

Ans. I meant that the machines were fitted for lasting long-legged boots, and that they were all being used for lasting long-legged boots while I was in the factory.

Cross-Int. 357. Reference has been made in your direct examination to a machine called the Amazeen skiver, and I note at one point in your testimony you refer to prior types of machines, and among other things you say that patents at that time had expired on these two machines. In view of the fact that this testimony is scattered through the record, will you kindly now briefly state what patents on vamp skivers and Amazeen skivers, so called, were known to you existing in the prior art running back ten or fifteen years prior to 1899, and whether machines constructed as set forth in that patent were put out, and, if so, by whom, and approximately to what extent they were used, so far as you are informed? Please note I do not ask for an extended discussion of

this matter, but desire at this point to get the facts on the record briefly.

Ans. I have not at hand copies of patents which I need to have before me in order to answer the question in reference to machines of the type shown in Plaintiff's Exhibit 192, which is a cut of the Carver vamp-skiving machine adapted for skiving heavy vamps and box toes, but I have before me copies of patents on the Amazeen skiving machine and will accordingly answer the question so far as I am now able by giving the information requested in regard to the Amazeen skiving machine.

As stated in my previous testimony relating to this machine, officially known as "Skiving Machine, Amazeen", the first patent of which I am aware disclosing that type of skiving machine is No. 200,682, February 26, 1878, Amazeen. The next patent is No. 220,906, October 28, 1879, Amazeen, and the first commercial skiving machine of which I am informed was constructed substantially as is shown in that patent No. 220,906. The machine of that patent has, of recent years, been designated as "Model No. 1".

The next step in the development of the Amazeen skiving machine is illustrated in patent No. 273,931, March 13, 1883, Amazeen. The machines which are now known as model No. 2 and model No. 3 were constructed substantially as shown in that patent No. 273,931, the differences between the two models being differences in mechanical construction.

The machine now known as model No. 4 was constructed substantially as shown in patent No. 518,774, April 24, 1894, Bayley. Model No. 5 was a step in the development from the preceding models, which resulted in model No. 6, which is the machine illustrated on page 132 of Plaintiff's Exhibit 190, being United Shoe Machinery Company's catalogue of 1902. All of the models preceding this model No. 6 are no longer manufactured, and have not been manufactured for some years. This model No. 6 is constructed substantially as shown in patent No. 645,381, March 13, 1900, Bayley, and No. 636,942, November 14, 1899, Bayley.

The present commercial Amazeen skiving machine is known as

model No. 7, and is constructed substantially as shown in patents No. 823,578, June 19, 1906, Bayley, and No. 823,586, June 19, 1906, Davenport.

Cross-Int. 358. Kindly state by whom the machines of the earlier patents referred to by you were put out, and the extent of use, approximately, so far as you know.

Ans. The machines were put out in succession by Christopher Amazeen, the Amazeen Machine Company and the United Shoe Machinery Company. Each of the models preceding model No. 7, to which I have referred, was in turn the standard commercial machine for several years, until it was superseded by the next succeeding model. As stated in my previous answer, the present standard commercial machine is model No. 7.

Cross-Int. 359. Do you know whether any of the models 1, 2, 3 and 4 are now in use?

Ans. I think that none of the models 1 or 2 is in use, but there are some model 3 machines still in use. I think, however, that most, if not all, of the No. 3 model which are still in use have been equipped with the improvements of patent No. 452,996, May 26, 1891, Dunham.

Cross-Int. 360. Kindly state whether any of the exhibit shoes thus far introduced by the defendant are shoes of the kind you have referred to in your testimony as "freak shoes"?

Ans. On examining the shoes which have been put in evidence as exhibits by the defendants, I do not find any which I regard as "freak shoes".

Cross-Int. 361. Are any of the lasts which have been introduced by the defendants lasts adapted for the manufacture of freak shoes?

Ans. The Tokio last of Defendants' Exhibit No. 133, and the razor-toe last of Defendants' Exhibit No. 134, and possibly the cottage toe last of Defendants' Exhibit 132, would be regarded as freak lasts today, although they were regularly and extensively used about fifteen to eighteen years ago.

Cross-Int. 362. In your testimony in chief you made reference to lasting machines adapted peculiarly, as I recollect your statement, for the lasting of freak shoes. Will you briefly explain what

particular type of shoe or shoes you had reference to in using the term "freak shoes"?

Ans. I shall be obliged to ask you to refer me to the testimony to which you refer. I do not recall that I have testified in regard to any lasting machines peculiarly adapted for the lasting of freak shoes.

Cross-Int. 363. Do you recollect testifying that certain lasting machines were used principally for the making of sample and freak shoes?

Ans. No, sir. I have, however, testified that the Acme leveling machine was used for leveling freak and sample shoes in factories where the regular work was done on the Goodyear automatic leveling machine.

Cross-Int. 364. Now, will you kindly explain what kind of shoes you referred to when you spoke of "freak shoes"?

Ans. I had reference to shoes made on lasts having exaggerated or extreme lines. I have a number of such shoes in my office which I shall be glad to produce by way of illustration.

Cross-Int. 365. In your direct testimony you said, among other things: "Machines known as McKay & Copeland lasting machines were put out for many years prior to 1899." Will you at this point kindly state whether the McKay & Copeland lasting machines referred to by you were put out as early as 1890, and if put out as early as that date, or earlier, state, so far as you are able, when and by whom?

Ans. The McKay & Copeland lasting machine about which I have previously testified is the present standard commercial McKay & Copeland lasting machine adapted and used exclusively for very heavy shoes, such as brogans, as illustrated in Defendants' Exhibit 143. That machine without the improvements which have subsequently been adopted was first put out about 1897. Prior to that time there had been put out for many years a machine which, in the successive stages of its development, beginning in 1882, had been known as the McKay & Copeland lasting machine. Prior to 1882 the predecessor of that machine, known as the Copeland lasting machine, had been put out for some two or three years. This

Copeland lasting machine was put out by the Copeland Lasting Machine Company, and the machine which in its earlier form was put into commercial use in 1882 was put out in its successive improved forms until its reorganization in 1895 and 1897 by the McKay & Copeland Lasting Machine Company.

Cross-Int. 366. If you have before you the patents under which the early machines referred to by you were manufactured, will you kindly read the number, date, title and name of patentee in the record at this point?

Ans. The earlier machines to which I have referred, that is, the machines which were put out before the reorganization of the McKay & Copeland machine in 1895 and 1897, were constructed as shown or embodied mechanisms set forth in the claims of the following patents: —

Patent No. 191,937, June 12, 1877, Copeland, Woodward and Brock, reissued as No. 8,138, March 26, 1878.

Patent No. 197,607, November 27, 1877, Copeland, Woodward and Brock.

Patent No. 208,156, September 17, 1878, Copeland, Woodward and Brock.

Patent No. 90,651, June 1, 1869, Fischer.

Patent No. 231,076, August 10, 1880, McKay and Fairfield.

Patent No. 251,430, December 27, 1881, Glidden.

Patent No. 286,898, October 16, 1883, Brock.

Patent No. 193,446, July 24, 1877, Hatch, reissued as No. 8,764, June 17, 1879.

Patent No. 254,617, March 7, 1882, Copeland and Brock.

Patent No. 286,898, October 16, 1883, Brock.

Patent No. 288,689, November 20, 1883, Brock.

Patent No. 302,885, August 5, 1884, Brock.

Patent No. 371,816, October 18, 1887, Brock.

Cross-Int. 367. In your examination in chief you have referred, to a considerable extent, to the change in machines for the manufacture of shoes growing out of the manufacture by machinery of extension edge shoes, which, as I understand your testimony, occurred somewhere about 1895. Do you wish to be understood

as saying that when the extension edge shoes came into more extensive use the machines previously employed and which were not adapted for the manufacture of extension edge shoes became obsolete and were abandoned?

Ans. Yes, in one case; while in another case the organization of the machine previously used was modified to adapt the machine for operation upon extension edge shoes.

Cross-Int. 368. Please explain what you meant in your last answer when you said: "Yes, in one case".

Ans. The Briggs rounding machine was not adapted for use on extension edge soles and was superseded by the machine now known as "Rounding and Channeling Machine, Goodyear Universal".

Cross-Int. 369. Kindly explain what you mean in your last answer but one when you used the phraseology: "while in another case the organization of the machine previously used was modified to adapt the machine for operation upon extension edge shoes".

Ans. I referred to the machine now known as "Lockstitch Machine, Goodyear Outsole Rapid", which has been usually referred to in the testimony before the examiner as the Goodyear out-sole lockstitch machine of 1899.

Cross-Int. 370. Have you any statistics, which you consider reliable, giving the number of shoes having extension edge soles manufactured in the United States covering any period of years, also shoes without extension edges?

Ans. No, sir, I have not such statistics, but made inquiries recently which led me to the conclusion that nearly all men's and women's welt shoes which have been manufactured for at least five or six years were made with extension edge soles.

Cross-Int. 371. Kindly state your source of information.

Ans. The inquiries were made through the branch offices of the United Shoe Machinery Company located in the leading shoe centres and through the company's employees connected with those offices who have been, during that period, most familiar with the work being done from day to day in shoe factories making welt shoes.

Cross-Int. 372. Can you specify in what factories the inquiry was made?

Ans. I did not state that inquiries were made in any factories.

Cross-Int. 373. Then the information does not come from factories; is that correct?

Ans. The information comes from men whose duties in the care of machines used in factories throughout the United States in the manufacture of welt shoes have kept them in constant touch with the work being done in those factories from day to day during the period referred to.

Cross-Int. 374. And the men referred to in your last answer from whom the information was obtained are employees of the United Shoe Machinery Company, are they not?

Ans. Yes, sir.

[*Adjourned to 10 o'clock* A. M., *Wednesday, November 5, 1913.*]

BOSTON, MASS., November 5, 1913.

Cross-Int. 375. If you now have the data as to the insole channeling machine illustrated on page 95 of Plaintiff's Exhibit 220, as to whether the device illustrated on said page 95 is the subject-matter of any patent, and, if so, what patent, and as to the period of time the Goodyear out-sole channeler was active, kindly now answer the question.

Ans. The earliest date which I have been able to ascertain when the turn and insole channeling machine illustrated on page 95 of Plaintiff's Exhibit 220, being Goodyear Shoe Machinery Company's catalogue of January 1, 1897, was commercially used in the manufacture of shoes, is 1876, although the machine may have been put out for a year or two before that year. The machine as it was then put out was, I am advised, constructed substantially as shown in patent No. 143,237, September 30, 1873, Hadley. The machine of the Hadley patent, with such changes as brought it into the form shown on page 95 of Plaintiff's Exhibit 220, was used until the machine was reorganized about 1894 by incorporating in it the improvements shown in the drawings and set forth in the claims of patent No. 550,402, November 26, 1895, Beckman,

which improvements have been discussed in detail in my previous testimony relating to channeling machine, Goodyear (insole and turn).

The first shipment of the Goodyear out-sole channeler of which I have obtained definite information was in 1879, although I am confident that the machine was used for probably two or three years before that date. The machine was used until it was superseded about 1891 by the Briggs rough rounding machine.

Cross-Int. 376. Is it not a fact that heels were attached to shoes by machinery as early as 1885?

Ans. Yes, sir; heels were attached by machinery as early as 1867.

Cross-Int. 377. Is it not a fact that heels were compressed by machinery as early as 1885?

Ans. Yes, sir; heels were compressed by machinery as early as 1871.

Cross-Int. 378. Will you please very briefly explain the difference between surface nailing of heels and blind nailing?

Ans. As I have previously explained in detail, when heels are "surface nailed" the heel-attaching nails are driven through the entire heel, including the top-lift, so that the head ends of the attaching nails are substantially flush with the tread face of the top-lift and are visible in the finished shoe. When heels are "blind nailed" the top-lift is not secured to the body of the heel when that is attached to the shoe. In attaching the body of the heel to the shoe the head ends of the nails are left projecting above the outer face of the heel and then the top-lift is attached to the body of the heel by "spanking" it upon the head ends of the nails, that is, the top-lift is attached to the body of the heel by forcing the head ends of the nails into its inner side by pressing the top-lift upon them. In a blind-nailed heel the head ends of the heel-attaching nails are not visible in the finished shoe.

Cross-Int. 379. Is it fair to say that the distinguishing characteristic generally stated between a loose-nailing machine and other nailing machines is that in a loose-nailing machine the nails are in

a hopper or reservoir in a loose condition and the machine gathers them up and arranges the nails for proper feeding to the machine?

Ans. No, sir, I think it would not be fair to state the distinguishing characteristic in that way.

Cross-Int. 380. Will you give the names of the four or five inventors who were put to work to adapt the Plant improvements for the model G welt and turn sewing machine which you say was at that time, in 1910, the standard commercial machine of the United Company?

Ans. Among them were the following inventors: Laurence E. Topham, Andrew Eppler, Ralph C. Simmons, E. E. Winkley, William C. Stewart, Albert Latham.

Cross-Int. 381. Can you now state the number of welt and turn machines which have been put out by the United Company or its subsidiary company, the United Shoe Repairing Machine Company, among cobblers in the United States up to December 1, 1911?

Ans. No, sir: I have not that data at hand, but shall be glad to get it.

Cross-Int. 382. Kindly do so and at the same time get the same information with reference to rapid out-sole lockstitch machines.

Ans. Yes, sir.

Cross-Int. 383. What became of the Eppler welters and stitchers taken over by the United Company from the Eppler Company?

Mr. PHILLIPS. Question objected to as relating to no matter touched upon in the direct examination of this witness and as the witness cannot be assumed to have any personal knowledge of the matter.

Ans. Such welters and stitchers taken over by the United Company from the Eppler Company as were in the hands of shoe manufacturers were retained and used by those manufacturers until the manufacturers displaced them by Goodyear machines. Such machines as were taken over from the Eppler Company by the United Company as were not in the hands of shoe manufacturers were kept on hand to supply demands for such machines from shoe manufacturers. It is my recollection that about forty of the

Eppler welters were supplied to shoe manufacturers during the first year or two after the United Company was formed.

Cross-Int. 384. Did the United Company manufacture Eppler welters and stitchers?

Mr. PHILLIPS. Objected to as relating to nothing referred to in the direct examination of this witness and as the witness cannot be assumed to have any personal knowledge of the matter.

Ans. I could not be sure about that without looking it up. I think it quite likely, however, that the United Company was able to supply such small demand as there was for those machines by supplying rebuilt machines which had been returned by shoe manufacturers.

Mr. WEBSTER. Answer objected to as not responsive.

Cross-Int. 385. So far as you know at the present time, the United Company did not manufacture Eppler welters and stitchers, did it?

Mr. PHILLIPS. Question objected to as improper cross-examination, relating to no matter touched upon in the direct examination of this witness.

Ans. I don't know.

Cross-Int. 386. Do any of the patents you have discussed in your deposition in chief have reference to the construction shown in the Eppler welters and stitchers?

Mr. PHILLIPS. Question objected to as improper cross-examination because it relates to no matter referred to in the direct examination of this witness.

Ans. The only patent which I recall having mentioned in my testimony in chief relating to welters or stitchers which was acquired by the United Company from the Eppler Company is patent No. 507,873, October 31, 1893, Arnold.

Cross-Int. 387. Have you in mind, or have you a memorandum of, any other patents relating to the Eppler welter or stitcher; and, if so, will you kindly give the number, date and title?

Mr. PHILLIPS. Question objected to as improper cross-examination because manifestly relating to no matter touched upon by this witness in his direct examination, and the witness is instructed

that he is under no obligation to answer the question unless instructed so to do by counsel or by the court.

Ans. Under instructions of counsel, I decline to answer the question.

Cross-Int. 388. Pardon me, but I call your attention to the fact that I do not understand you have been instructed to decline to answer the question. Do you decline to answer?

Mr. PHILLIPS. As at present advised, I instruct the witness not to answer the question unless ordered to do so by the court.

Ans. Under instructions of counsel, I decline to answer the question.

Cross-Int. 389. Kindly give the date when you first went with the firm of Fish, Richardson & Storrow.

Ans. December 1, 1895.

Cross-Int. 390. Kindly give the date when you first became associated with the McKay Shoe Machinery Company.

Ans. September 1, 1898.

Cross-Int. 391. And then, as I understand you, you became associated with the United Shoe Machinery Company in February, 1899?

Ans. Yes, sir.

Cross-Int. 392. And your first connection with shoe machinery of any kind was after your connection with the firm of Fish, Richardson & Storrow; is that correct?

Ans. That is substantially correct.

Cross-Int. 393. You have testified at considerable length with reference to slugging machines, and in connection with such testimony you made reference to a considerable number of patents, the earliest of which seems to be May 11, 1897. Will you kindly state if you know of patents on slugging machines of a date earlier than said patent referred to?

Ans. The first patent of which I am aware which discloses a slugging machine is patent No. 410,927, September 10, 1889, Robinson and Watt. Prior to 1888 or 1889 heel slugging was universally done by hand.

Mr. WEBSTER. All that portion of the foregoing answer begin-

ning with and following "Prior to 1888" objected to as not responsive.

Cross-Int. 394. Would it be proper to say that a slugging machine is included in the general term of metallic fastening machines?

Ans. I think so.

Cross-Int. 395. And a slugging machine is a machine that is usually employed to drive metallic slugs into the heel, is it not?

Ans. Yes, sir; that is, into and through the top-lift and one or two adjacent lifts of the heel.

Cross-Int. 396. In your direct examination you testified under objection with reference to certain machines put out by the United Shoe Machinery Company which do work always done by hand in 1899, or not done at all either by hand or machine in 1899, and I now ask you *de bene* and without waiving objection to the question or the answer if you will kindly point out which of the machines in the list spread upon the record by you do work not done at all either by hand or by machine in 1899?

Ans. Clinch machine, Universal double, attaches soles in a novel manner and by means of a novel fastening which had never been used for attaching soles at the time the machine was introduced.

Eyeletting machine, Duplex, was the first machine which set two eyelets on opposite sides of an upper simultaneously.

Embossing machine, Goodyear heel, performed an operation which, so far as I know, had never been performed either by hand or by machine before that machine was introduced.

Lasting machine, staple, was a machine which, so far as I am advised, performed the lasting of the shoe and securing it in place in a manner in which that work had never been done before.

Stapling machine, Goodyear upper, also performed an operation which, prior to the introduction of that machine, had not before been performed either by hand or by machine.

Stitching machine, Economy insole, is another machine which performed an operation never performed either by hand or by machine before that machine was produced.

Mr. WEBSTER. This closes the cross-examination of the witness as counsel is at present advised, unless through inadvertence, acci-

dent or mistake counsel has omitted to inquire of the witness, and except as to the matters with reference to which the witness is to produce data, and excepting as to matters to which the witness has refused to make answer, and counsel reserves the right to go into these matters at a later period if permitted by the court or if opposing counsel shall withdraw their instructions to the witness with reference to such answers.

[*Adjourned to 10 A. M., Thursday, November 6, 1913.*]

BOSTON, MASS., November 6, 1913.

Direct Examination resumed by Mr. PHILLIPS.

Int. 397. Have you the data called for by counsel for the United States in regard to the number of welters and stitchers of the United Company in use by cobblers?

Ans. I was requested to ascertain and state the number of welt and turn machines which have been put out by the United Company or by the United Shoe Repairing Machine Company among cobblers in the United States up to December 1, 1911. I find that no welt and turn machines have been supplied either by the United Company or by the United Shoe Repairing Machine Company to cobblers, that is, to those engaged exclusively in the business of repairing shoes. I should add, however, that the United Company has supplied welters to twelve different shoe manufacturers who do some shoe repairing in connection with their regular business of manufacturing shoes. I cannot state whether those welters are used by such manufacturers in their repairing work.

I was also requested to obtain similar information in regard to out-sole lockstitch machines. I find that on December 1, 1911, the United Shoe Repairing Machine Company had put out for use by cobblers 961 out-sole lockstitch machines. In addition to those machines, the twelve shoe manufacturers who also do some repairing work, to whom I referred in the preceding paragraph, have out-sole stitchers which were supplied to them by the United Shoe Machinery Company.

Int. 398. In a cross-interrogatory counsel for the United States referred to a list of machines which was read into the record by

you in your direct examination, and you were asked in substance if you testified that "all the machines specified in that list" were necessary for the successful manufacture of shoes. Will you please state what machines, if any, are necessary for the manufacture of a welt shoe, what for a turn shoe, and what for a McKay shoe? Please state what advantage is secured by the use of modern machinery in the manufacture of shoes.

Mr. WEBSTER. Question objected to for that it calls for matter fully gone into in the direct examination.

Ans. A welt shoe requires no machine for its proper manufacture, and in fact welt shoes were made by hand long before machines were introduced for their manufacture. The turn shoe was also made by hand long before there were machines adapted for use in its manufacture. A McKay sewed shoe is in part essentially a machine-made shoe, since that term is used to designate shoes the soles of which have been attached by the use of the McKay sewing machine. McKay sewed shoes were, however, manufactured in large numbers some years before the first lasting machine was put into commercial use, and aside from the McKay sewing machine no machine is required for the manufacture of a McKay sewed shoe.

The advantage gained by the use of modern shoe machinery in the manufacture of shoes is a decrease in the cost of production, and, since the latest types of shoe machines have been introduced, an improvement in the quality of the work. I do not wish to be understood as testifying that a shoe can be made any better by machinery than by hand work, assuming that the hand workman was sufficiently skillful, took the amount of time necessary and gave enough care to produce perfect work, but I do wish to say that the average shoe made by modern machines is better than the average shoe which was made in shoe factories largely by hand processes prior to the introduction of modern machines.

Ths welt shoe, so called, is the most satisfactory construction known to the shoe-making art as regards comfort, durability, wear and the facility of repairing it, although in cases where extreme lightness and flexibility are required there are advantages

in the turn shoe. All the better grades of men's shoes are welt shoes, and all the better grades of women's shoes are either welt shoes or turn shoes. The difference in cost between hand-made shoes and shoes made by modern machine processes is a matter of such common knowledge that it hardly need be referred to, and the wearing qualities of a welt or turn shoe made by modern machine processes are superior to the wearing qualities of a welt or turn shoe as it would be made by hand under factory conditions; that is, the machine-made welt and turn shoes which are supplied to the public today are better shoes than they would be if they were made by hand, and of course they are much less expensive.

I will also state that the industry has been brought to such a point that the saving of a fraction of a cent in the manufacturing cost of a pair of shoes is of the greatest importance to shoe manufacturers, since in a factory of average capacity such a saving would amount to several thousands of dollars a year.

Int. 399. You have been interrogated by counsel for the United States in your cross-examination in regard to machines used for the ornamentation of shoes. Will you please state what, if any, importance the ornamentation of shoes is to the modern shoe manufacturer?

Mr. WEBSTER. Objected to for that the witness has not qualified in a manner to tend to show that he is competent to testify as to the importance of such matters to manufacturers, and as merely calling for the opinion of the witness, and, further, as calling for matter in no wise pertinent to the issues involved in this cause.

Ans. The neatness or finished appearance of a shoe often means the difference between the salability or the unsalability of a product, so that obviously the giving to the shoe of a sightly and pleasing appearance is of great importance to the modern manufacturer. The extensive introduction of American shoes into foreign markets, particularly into the English market, is largely due to their neater appearance.

Int. 400. Were the processes which have been referred to by you in your cross-examination as wholly or partly for the purpose

of ornamentation of sufficient importance to have been performed by hand prior to the introduction of machinery for that purpose?

Ans. Yes; I understand that all of those operations were formerly performed by hand, although I believe in no instance as effectively as they are now performed by machine.

Int. 401. You were asked on cross-examination whether the employment of a burnishing machine or of a blacking or polishing machine added to the wearing quality of a shoe, and whether the indenting and burnishing machine relates to anything but ornamenting a shoe. Please state whether there is anything that you wish to add to that portion of your deposition. If so, will you kindly state it?

Ans. In answering the questions about those machines I should have explained the important work which they do in protecting the shoe against the action of water and moisture. The burnishing operation performed upon the edge of the sole is known in the industry as "edge setting", while the burnishing operation upon the edge of the heel is known as "heel bnrnishing". Before these operations are performed the edge of the sole and the edges of the "lifts" of the heel are raw and porous, and if left in that condition would quickly absorb water when the shoe was worn and would even absorb moisture from the atmosphere. Referring first to the edge-burnishing or edge-setting operation, before that operation is performed the edge of the sole and the edge of the welt in a welt shoe are coated with blacking which contains about twelve per cent of wax. In the operation of the edge-setting machine this blacking is forced into the pores of the leather on the edge of the sole and the edge of the welt, fills up any crack which there may be between the sole and the welt, and when the operation is completed there is a thin film of wax on the combined edge of the sole and welt which effectively prevents the water or moisture entering the pores of the leather and penetrating between the sole and the welt. If the water entered the pores of the leather in the sole it would cause the sole to swell, and when it dried the sole and welt would, in the shrinking of the sole as it dried, pull away from each other or "check", as it is designated in the industry, This would allow

water and fine gravel to enter between the welt and sole, which would penetrate to the outseam and eventually to the inseam, and would result in damage to one or both of those seams, so that one or both would be likely to give way and the shoe come apart.

As to the practical advantages of the heel-burnishing operation, if this were not performed, water and moisture would enter the open pores of the edges of the heel lifts and would penetrate between adjacent lifts, which would cause the lifts to swell, with danger of forcing the top-lift off the heel. When the lifts shrunk or dried the heel would "check", that is, there would be cracks between adjacent lifts which, besides giving the heel an unsightly appearance, would expose it still more to the action of water and moisture, and soon the leather of the heel would rot and its wearing qualities become seriously impaired. It is the practice to burnish heels in one of two ways: either blacking is applied to the heel before the burnishing operation, which, like the blacking applied to the sole edge, as previously stated, contains about twelve per cent of wax; or the heel is first coated with blacking which does not contain wax and then in the burnishing operation clear melted wax is applied to the heel. As the result of a heel-burnishing operation by either of these methods, any cracks in the edge of the heel are filled up and a thin film of moisture-resisting wax is spread over the entire edge of the heel.

The indenting and burnishing machine operates upon a welt in the condition which is illustrated in the shoe which I now produce.

[*Fudge stitched shoe prior to wheeling and burnishing operation is introduced in evidence, and marked "Defendants' Exhibit 201".*]

Mr. WEBSTER. The introduction of the exhibit is objected to as utterly immaterial.

[*Answer to 401 continued:*]

As explained in my previous testimony relating to "Wheeling and Burnishing Machine", an indenting and burnishing machine is used upon shoes which have been fudge stitched, that is, which have had their soles attached by a seam which is sunk in a slit formed in the upper surface of the welt as illustrated in Defendants' Exhibit No. 201. This slit in the welt, if it were not closed

up, would obviously collect water, sand and gravel, which would quickly rot and decompose the outseam. This danger is obviated by the successive use of the wheeling machine and the stitch-burnishing machine. Prior to the operations of those machines the upper surface of the welt is coated with blacking, which is applied to the upper face of the welt at the same time that it is applied to the sole edge, and, as previously explained, that blacking contains about twelve per cent of wax. By the two operations that are then performed upon the upper face of the welt, first a wheeling to form imitation stitch impressions, and secondly the burnishing of those stitch impressions by a rapidly reciprocating tool, the slit in the upper face of the welt is closed and the coating of blacking and wax effectively prevents any water or fine gravel from entering the slit. A further advantage of the wheeling and burnishing operations is that they tend to harden the welt and to crowd it down into firmer and closer contact with the sole, owing to the pressure exerted upon the welt by the wheeling and burnishing tools.

Int. 402. You were asked upon cross-examination, in substance, to explain how the employment of a beading machine adds to the wearing quality of shoes. Will you please consider your answer to this question, and if you desire to make any additions thereto, or corrections therein, will you please do so?

Ans. In my previous testimony I explained that after the upper and lining have been stitched together wrong side out the beading machine is used in the operation of turning the upper and lining right side out and in flattening the seam which unites the upper and lining, and I further stated that if the seam were not properly flattened by the beading machine it would not be as secure and there would be more danger of the seam ripping and the upper and lining coming apart. I should like to add to that answer, that after the upper and lining have been turned right side out and the seam has been hammered and flattened by the beading machine it is the universal practice to stitch the upper and lining together by another seam close to the edge of the lining and upper, the operation of so stitching the lining and upper being known in

the industry as the "second closing". That seam of course adds greatly to the security of the attachment of the upper and lining and insures against their coming apart. It would be entirely impracticable to sew the upper and lining together by this second seam if the first seam, made when the lining and upper were wrong side out, were not properly flattened after they had been turned right side out.

My previous answer was incorrect in the statement that it is the "universal practice" to stitch the upper and lining together wrong side out. Formerly a large majority of shoes, including nearly all women's shoes, were made in that way, but since I made the statement from which I have quoted I have learned that it is now the more common practice to fold the edge of the upper and the edge of the leather "stay piece" which forms the marginal portion of the lining, and then to stitch the upper and lining together right side out. When the upper and lining are sewed together in this manner it is not customary to use the beading machine.

Int. 403. You have been interrogated on cross-examination in regard to the "scouring machine". What operation on the edge of the heel follows that of the scouring machine to make the finished product, and what is the effect of the combined operations of the scouring machine and such later processes, if any, on the durability of the shoe?

Ans. In my answer to the second preceding question I explained how the heel-burnishing operation adds to the durability and contributes to the wearing qualities of the heel. The operation of the heel-scouring machine must be performed before a heel can be burnished. After the operation of heel trimming the shoe is left in the rough condition illustrated in the shoe which I now produce, in which the heel has been trimmed but has not been scoured.

[*Shoe showing heel after heel-trimming operation, and before heel-scouring operation, is introduced in evidence, and marked "Defendants' Exhibit 202".*]

[*Answer to Int. 403 continued:*]

The particular effect of the burnishing operation in protecting the heel from the action of moisture and water would be largely

defeated if the heel were burnished in this condition. I now produce the mate of the shoe of Defendants' Exhibit 202, the heel of which has been scoured and illustrates the smooth condition in which the heel is left after the heel-scouring operation.

[*Shoe with scoured heel is introduced in evidence, and marked "Defendants' Exhibit 203".*]

[*Answer to Int. 403 continued:*]

It will be observed that by the heel-scouring operation all the rough and furry edges in Defendants' Exhibit 202 have been removed and the heel edge is perfectly smooth. The heel of Defendants' Exhibit 203 is in perfect condition to receive the protecting coat of blacking and wax which is applied by the heel-burnishing operation, while the heel of Defendants' Exhibit 202 cannot be properly burnished until it has been scoured.

Int. 404. You have been interrogated in your cross-examination with regard to the introduction of new machines in the shoe manufacturing art, and displacement of former machines and appliances thereby. Please state what difficulties were met with, if any, by the United Company in the introduction of such machines, and what generally, so far as you know, is the difficulty, if any, attendant upon the introduction of new machines in the shoe manufacturing art.

Mr. WEBSTER. The question is objected to because of being general in its scope, not being limited to any particular field, and because it calls for matter in no wise pertinent to the issues involved in this cause, and therefore calls for matter which is immaterial, inadmissible and incompetent.

Ans. Operators who have run machines for years become very familiar with those machines, know exactly what they will do and are able to get from those machines the maximum amount of work of which the machines are capable. When such an operator begins to run a new machine which is radically different in its organization from the old machine he is entirely unaccustomed to the new machine and it frequently takes him a long time to become as familiar with the new machine as he was with the old machine; consequently it often requires a long period before such an operator

becomes sufficiently familiar with the new machine so that he can get from it the amount of work which he was getting from the old machine, and much less the increased output of which the new machine is capable. It often happens that an unskilled operator will learn to run a radically new machine more readily and more quickly than will an old operator who has been accustomed to an old type of machine for doing the same work. Accordingly, considerable opposition has been encountered by the United Company on the part of operators of old machines when the company has attempted to introduce new machines. It is further a fact that shoe manufacturers often partake to some extent of the prejudice of operators, and dislike to make a change in the machines which they are using for fear that such change may intertere with their business. Further, some manufacturers who are using a number of old machines for doing the same work dislike to make any gradual change, but prefer to postpone using any of the new machines until they can change all of the machines for doing that work which they have in their factories.

Mr. WEBSTER. Answer objected to because the same is more in the nature of argument and expression of opinion with reference to matters of which the witness has no personal knowledge, and it is therefore incompetent, inadmissible and immaterial.

Int. 405. You have been interrogated at some length in your cross-examination in regard to the Acme leveler and the Goodyear automatic leveler. Please state the relative amount of skill required upon the part of the operator of an Acme leveler and of a Goodyear automatic leveler, and also state the relative capacity of these machines and how many of each of these machines were put out by the United Company up to March 1, 1913.

Mr. WEBSTER. Question objected to because it does not yet appear that the witness has had any personal experience in operating the machines referred to in the question, and because the question calls for matters occurring since the filing of the bill.

Ans. The automatic leveling machine requires no skill on the part of the operator. The machine is adjusted to impart a predetermined shape to the bottom of the sole of a shoe without any

2777

interference on the part of the operator. The successful operation of the Acme leveling machine, on the other hand, depends entirely upon the skill and judgment of the operator, because the relative inclination of the leveling roll and the sole in the operation of the roll on every point of the sole is determined manually by the operator, and the extent of the inclination depends entirely upon his skill and judgment. If his skill or judgment fails, the operation will not be performed properly. Accordingly, the automatic leveling machine can be operated by an unskilled workman or by a boy, while the Acme leveling machine requires a skilled workman for its successful operation. The capacity of the automatic leveling machine is about twice that of the Acme leveling machine.

As to the number of each of these machines which have been put out by the United Company up to March 1, 1913, the end of the company's last fiscal year, 1033 of the automatic sole leveling machines have been put out, while prior to that date 145 of the Acme leveling machines had been put out. During the year ending March 1, 1913, nine Acme levelers were supplied to manufacturers, while ninety-eight of the automatic levelers were put into shoe factories.

Mr. WEBSTER. Answer objected to for the reasons given in objecting to the question, and especially all reference to anything occurring after the date of the filing of the bill herein is objected to as utterly incompetent, inadmissible and irrelevant.

Int. 406. You have been cross-examined at some length in regard to the looper heater on the Goodyear welt and turn machine of 1899. Will you please describe the construction of the looper heater of that machine, and state whether or not the decision to which your attention was called on cross-examination alters in any way any opinion which you have expressed with regard to the relation of such construction to the subject-matter of any United States Letters Patent?

Ans. The "heated block or plate" which is an element of the claim of patent No. 561,386, June 2, 1896, French, is in the commercial welt and turn swing machine of 1899 a thin composition casting made of copper and zinc. Accordingly this plate may be

easily bent so that the looper carrier will not, in its movement, be put into actual physical contact with the heated plate. When the plate has been so bent, however, it may easily be bent back into its proper position so that the looper carrier will engage it at each operation of the machine; and, however that may be, a welt and turn sewing machine of the 1899 type which is provided with such a plate is always capable of operating as called for by the claim of the French patent No. 561,386. So far as I can see, the decision of the Circuit Court of Appeals for the First Circuit in United Shoe Machinery Company *v.* Greenman, to which decision my attention was called on cross-examination, has no bearing upon my previous testimony in regard to this French patent No. 561,386. That decision merely held that a construction comprising "a spring support keeping the heated block constantly in contact with the looper carrier throughout the movement of the looper carrier" (146 Fed. Rep., page 760) did not infringe the claim of the French patent in question, which calls for "means to move said carrier to put it in contact intermittingly with the said heated block or plate".

Int. 407. In your cross-examination you were asked in regard to the automatic leveler: "Does the condition of the sole as to hardness or softness have anything to do with the automatic stopping of the portion of the machine which operates on the sole?" Your answer to this question, in view of the two following answers, is not quite clear to me. Will you please explain this matter more fully than you have heretofore done?

Ans. The automatic leveling machine is organized to level the sole of any shoe which it is capable of leveling without manual interference on the part of the operator after the shoe has been presented to the leveling mechanism. It is provided with suitable adjustments for adapting it to operate properly upon a shoe of any size which may be presented to it, and it is also provided with an adjustment for varying the amount of pressure which is applied to the soles through the leveling roll, so that a shoe having a hard, thick sole can be leveled under greater pressure than a shoe having a soft or thin sole. The adjustment of the machine for adapting it to shoes of different sizes is made before the jack carrying the

shoe and presenting it for the operation of the leveling roll is brought by the operator into connection with the mechanism which operates the jack. The adjustment for varying the amount of pressure exerted upon the sole is also usually a preliminary adjustment, as it is not customary for the operator to change that adjustment while the machine is in operation. The operation of the machine on each shoe, however, assuming the machine to be running at a uniform speed, takes place in the same length of time whether the sole of the shoe be hard or soft.

Int. 408. In your present deposition you have referred, both in your direct and cross-examination, to many patents of the United Shoe Machinery Company under which it has made and put out machines. If any of those patents are not directly the property of the United Shoe Machinery Company, name the same.

Ans. In my discussion of blacking machine, model A, crest heel, one of the patents to which I referred as setting forth in its claims the organization of that machine was No. 805,763, November 28, 1905, Tuttle. That patent is owned by the United-Xpedite Finishing Company, a majority of the capital stock of which is owned by the United Shoe Machinery Company. The United Company, further, has a license under that patent.

One of the patents which defines in its claims mechanisms embodied in the flexible insole machine, Gem, is No. 609,110, August 16, 1898, Milner. The United Shoe Machinery Company does not own this patent, but has a license under it.

In discussing the patents which set forth mechanisms embodied in lacing machine, Ensign, I mentioned patent No. 855,969, June 4, 1907, Paine and Winkley. The United Company now has a license under that patent, which will eventually be assigned to the United Company.

Two of the patents which I mentioned as setting forth mechanisms embodied in lasting machine No. 5, U S M C, were No. 1,017,124, February 13, 1912, Winkley and Alley, and No. 1,018,025, February 20, 1912, Winkley and Alley. The United Shoe Machinery Company now owns a half interest in each of these

patents. The other half interest will be assigned to the company in due course.

Two of the patents mentioned by me in connection with leveling machine, Atlas, are No. 818,503, April 24, 1906, Winkley, and No. 818,504, April 24, 1906, Winkley. The United Company is entitled to an assignment of both of these patents under the agreement between Winkley and Phillips and the United Shoe Machinery Company which constitutes Plaintiff's Exhibit No. 77, and is reproduced as an exhibit on page 615 of the record. Formal assignment of these two patents has not as yet been made, but will be effected in due course.

In my discussion of the experimental slugging machine, No. 5, I mentioned patent No. 809,160, January 2, 1906, Wingo. After that machine had been constructed it was found that a mechanical movement embodied in it prima facie infringed that Wingo patent, which was owned by the Brown & Sharpe Manufacturing Company, of Providence, Rhode Island. Accordingly, the United Shoe Machinery Company obtained a license under that patent.

Otherwise than as I have above indicated, all of the patents which have been referred to by me in this deposition as containing claims defining mechanisms embodied in machines made and put out by the United Company are directly owned by that company.

Mr. WEBSTER. All testimony with reference to ownership or title to patents is objected to as secondary, and therefore incompetent, immaterial and inadmissible as showing title in, or rights under, patents, it not having been shown that the instruments conveying title cannot be produced. All reference to the ownership or title of, or rights under, any patents issued after the date of the filing of the petition herein is objected to as incompetent, immaterial and inadmissible as having no bearing on the questions involved in this cause.

Mr. PHILLIPS. So far as at present advised, my redirect examination of this witness is closed.

Cross Examination resumed by Mr. WEBSTER.

Cross-Int. 409. You have testified as to the number of rapid out-sole lockstitch machines put out by the United Shoe Repairing Machine Company. Will you kindly state when that company first began to put out rapid out-sole lockstitch machines with cobblers?

Ans. I have not data at hand which will enable me to answer the question accurately, but I think it was in 1908 or 1909.

Cross-Int. 410. And, as I understand you, the United Shoe Machinery Company never put out the rapid out-sole lockstitch machine among cobblers?

Ans. I did not wish to be so understood, and should explain that prior to the formation of the United Shoe Repairing Machine Company the United Shoe Machinery Company had supplied out-sole stitchers to cobblers, and during the fiscal year ending March 1, 1909, such machines as the United Shoe Machinery Company had previously supplied to cobblers were transferred to the United Shoe Repairing Machine Company.

Cross-Int. 411. So that the number given by you, 961 out-sole stitchers, includes those put out by the United Company and those put out by the United Shoe Repairing Machine Company; am I right?

Ans. Yes, sir.

Cross-Int. 412. Will you kindly state when the United Shoe Machinery Company first put out out-sole stitchers among cobblers?

Ans. I have not data at hand which will enable me to answer that question.

Cross-Int. 413. Will you answer it approximately, or as near as you can at the present time, and at the next session give the exact date?

Ans. I shall be glad to ascertain the exact date, and if agreeable would prefer to defer answering the question until I can answer it accurately.

Cross-Int. 414. Do the out-sole stitchers which have been put out by the United Company and by the repair company among cobblers, or in repair shops, differ in construction from the out-sole

stitcher put out by the United Company among shoe manufacturers?

Mr. PHILLIPS. Question objected to as ambiguous and uncertain.

Cross-Int. 415. State whether during the period the out-sole stitchers were being put out among cobblers the machines differed in construction from the machines then being put out with shoe manufacturers?

Mr. PHILLIPS. Same objection.

Ans. Up to the date of the adoption of lockstitch machine, Goodyear out-sole rapid, model K, which became the standard commercial machine of the United Shoe Machinery Company on May 21, 1910, and which was succeeded in January, 1912, by lockstitch machine, Goodyear out-sole rapid, model M, the same machine was supplied to shoe manufacturers and to cobblers, that is, the Goodyear out-sole lockstitch machine of 1899 as subsequently improved. Since the date of the adoption of the model K lockstitch machine the same machine has been supplied to cobblers as before that date, that is, the machine officially known as lockstitch machine, Goodyear out-sole rapid.

Cross-Int. 416. In other words, as I understand your question, out-sole stitchers were adapted for both manufacturers' use and cobblers' use; am I right?

Ans. Yes, sir.

Cross-Int. 417. Are you willing to state whether the out-sole stitchers that are put out in repair or cobbler shops are put out under a lease or are sold outright?

Mr. PHILLIPS. Objected to as relating to nothing referred to either in the direct or redirect examination of this witness, and the witness is instructed that he is not called upon to answer the question unless ordered to do so by the court.

Ans. In view of advice of counsel, I decline to answer the question.

Cross-Int. 418. In your redirect testimony you referred to the case of United Shoe Machinery Company *v.* Greenman, reported in 146 Fed. Rep., page 759, this being a cause in which the interpretation of the claim of patent to French, sewing machine, dated

January 2, 1896, patent No. 561,386, was involved; and I now ask you whether in reaching your conclusion as to the meaning of the claim of that patent you took into consideration the matter quoted by the court, the same being, as I understand it, an extract from the file-wrapper and contents of said patent, which matter, following the remark by the court "Upon appeal to the examiners in chief, it was urged by the complainant", reads as follows: —

"The prime requisite definitely made vital in the above issue is: There must be a heated block or plate and a looper-carrier, and the looper-carrier must move into, and out of, direct contact (*i. e.* touching engagement) with the block or plate, and the looper-carrier must be properly and continuously heated by this intermittent contact with said heated block or plate. . . ."

"The examiner does not base his rejection on any anticipatory device, but rejects it on the general state of the art, the said art being shown in nine patents, five of which are discussed in the examiner's statement. . . ."

"A review of these nine patents of record shows that there is no suggestion of heating any part by 'intermittent contact' thereof with a heated block. . . ."

"Again, each reference either has the heating means in constant contact with the part to be heated (as in Aldrich (2), Ashe, Garton), or it never at any time has the heating means in contact with the part to be heated (as in Wardwell (W14), 262,160, and Brown (D) 498,505). . . ."

"What is claimed is 'intermittent contact', and this only, and this is precisely what is shown and what is novel."

Mr. PHILLIPS. Question objected to as a mere repetition of cross-interrogatory, not relating to any new matter touched upon by the witness in his redirect examination.

Ans. Yes, sir.

Cross-Int. 419. Then do you mean that the word "contact" in the claim of the patent referred to has no meaning?

Mr. PHILLIPS. Same objection.

Ans. No, sir, I don't mean that.

Cross-Int. 420. Does it not mean "touching engagement"?

Mr. PHILLIPS. The same objection, and further objected to because the meaning of the word, in view of the decision referred to, is obviously purely a question of law.

Ans. I prefer to adopt the conclusion of the court that in view of the Patent Office proceedings it means "an intermittent contact as distinguished from a constant contact".

Cross-Int. 421. Well, if the heater plate and looper carrier are not brought in actual physical contact intermittingly, is the mechanism such as is referred to in the claim under discussion?

Mr. PHILLIPS. Question objected to as vague and indefinite, it not appearing what mechanism counsel for the Government has in mind, and the witness not being called upon to speculate as to hypothetical structures.

Ans. I adhere to the opinion which I have expressed in my previous testimony, that the claim of patent No. 561,386 would accurately describe an organization in which the looper carrier was intermittingly moved to a position sufficiently near the heated block or plate so that the looper carrier was heated by that block or plate. Undoubtedly the claim under discussion calls for an organization providing for intermitting movement of the looper carrier toward, and away from, the heated block or plate.

Cross-Int. 422. Is it not a fact that a very much more efficient result is attained in the mechanism under discussion when the heater block or plate comes in actual physical contact intermittingly with the looper carrier than when the parts are only to a position where the plate and carrier are near enough to heat the looper carrier and without being in actual contact?

Mr. PHILLIPS. Same objection.

Ans. The measure of the efficiency of the combination called for by the claims of the French patent is the imparting of a sufficient heat to the looper to prevent chilling the wax on the thread as the thread passes through the looper. If that result is secured, the maximum of efficiency is attained and nothing can be gained by imparting more heat.

Cross-Int. 423. Your answer does not seem quite clear to me, and I will put it in this way: whether actual physical contact intermittingly between the heated block or plate and the looper carrier is necessary for attaining the desired result?

Mr. PHILLIPS. Question objected to as based upon a hypothetical structure which the witness has had no opportunity to examine.

Ans. I think not in all cases. For example, on a cold winter day, when a factory was well heated and the steam under considerable pressure, an operator might very likely find that he would secure better results if the loop carrier did not quite touch the heated plate and he might accordingly find it advisable to bend the heated plate slightly so that the looper carrier would not quite touch it.

Cross-Int. 424. In your redirect examination you have made reference to "modern machines". Will you kindly state just what you mean by the term "modern machines"?

Ans. I mean, as they have been constantly and continuously improved during recent years, that improvement in respect to some machines dating back prior to the formation of the United Shoe Machinery Company. The term "modern machines" must, in view of the rapid development of the industry, be a relative term. Strictly, it means something different today from what it meant a year ago today, and as used a year ago today it would mean something different from what it would have meant if used as of conditions two years ago today.

Cross-Int. 425. Then in your testimony you did not use the term "modern machines" with any well defined meaning, did you?

Ans. Yes, sir.

Cross-Int. 426. I observe in your redirect testimony you say that at present shoes are less expensive than heretofore. Will you kindly point out what particular class of shoes are less expensive than they were a year or two years ago?

Ans. I believe that at no time in my testimony have I compared prices of shoes today with prices of shoes a year or two ago.

Cross-Int. 427. And is that the best answer you can make to the question?

Ans. I can add that I stated that shoes made by modern machines are much less expensive than shoes would be if made by hand processes.

[*Adjourned to 10 A. M., Friday, November 7, 1913.*]

BOSTON, MASS., November 7, 1913.

Cross-Int. 428. If you now have the data with reference to out-sole stitchers put out by the United Shoe Machinery Company among cobblers, as to the number put out by that company and the date when they were first put out, will you kindly spread it on the record?

Ans. The first Goodyear out-sole rapid lockstitch machine supplied by the United Shoe Machinery Company to a cobbler was shipped on February 18, 1899. Up to the time that the business with cobblers was taken over by the United Shoe Repairing Machine Company, in 1908, the United Company had supplied 292 of these machines to cobblers.

Cross-Int. 429. You say in your direct examination that the "extensive introduction of American shoes into foreign markets, particularly in the English market, is largely due to their neater appearance". Please state your authority for that statement.

Ans. It is common knowledge in the industry.

Cross-Int. 430. Where did you get your information?

Ans. I suppose I have been absorbing this information for years from actual contact with manufacturers and machinery men, from trade papers and from consular reports.

Cross-Int. 431. And do you say that shoes, especially welt shoes, as made now in England are not as neat in appearance as similar kinds of shoes made in the United States?

Ans. In view of the acknowledged superiority of American made shoes in respect to their style and appearance, English manufacturers have been striving for years to improve the style and appearance of their shoes, and at the present day there is by no means as great difference between the appearance of an American made shoe and an English made shoe as there was several years ago.

Cross-Int. 432. Is it not a fact that the English manufacturers have, for a considerable number of years, had the same kinds of machines furnished them by the United Company, or some company manufacturing the same machines, that the manufacturers of shoes have had in the United States?

Ans. English manufacturers have used some, but not all, of the machines which manufacturers in the United States use in the manufacture of shoes.

Cross-Int. 433. Could not English manufacturers have the various machines referred to by you for heel burnishing, blacking, edge setting, wheeling, etc., if they desired to use them?

Ans. Yes, sir; they could have had them if they had desired to use them.

Cross-Int. 434. I am endeavoring to fully appreciate the awful condition of things and the danger of shoes coming apart and water and gravel becoming lodged in the edges of the soles and the heels if the machine referred to for treating the edges of heels and the edges of soles were not employed, and I would like you to state whether it is not a fact that all of the various operations referred to by you, relating to the treatment of the edges of soles and the surfaces of heels, in your redirect examination cannot be performed by machines other than the machines furnished by the United Company.

Mr. PHILLIPS. Question objected to as referring to nothing touched upon in the direct examination of this witness, and as being argumentative and utterly immaterial to any issue before this examiner.

Mr. WEBSTER. Counsel for the petitioner respectfully calls attention to the phraseology of the witness found on page 2976 of the typewritten record [printed page 2772], as follows:—

"This would allow water and fine gravel to enter between the welt and sole, which would penetrate to the outseam and eventually to the inseam, and would result in damage to one or both of these seams, so that one or both would be likely to give way and the shoe come apart."

Counsel also calls attention to the frequent reference by the witness to the collection of water, sand and gravel which would quickly rot and decompose the outseam, to avoid which danger the witness certainly seems to say that the employment of wheeling machines, burnishing machines and polishing machines seems to be necessary.

Mr. PHILLIPS. Does the witness anywhere in redirect examina-

tion say that the operations of burnishing and edge setting cannot be performed by hand, or that they require any machines for their proper performance?

Mr. WEBSTER. Counsel states that he believes it does appear in the record that the witness states that all these things could be performed by hand, but the question now propounded is whether the same operations could be performed by machinery other than the machinery of the United Company.

Mr. PHILLIPS. With that understanding, the question is objected to as being improper cross-examination.

Ans. Machines for burnishing heels, machines for burnishing the edges of soles known as "edge setting" machines, and machines for wheeling and burnishing the upper face of the welt are offered to shoe manufacturers by other machinery concerns, in addition to those which are offered by the United Shoe Machinery Company.

Cross-Int. 435. *De bene*, and without waiving objections heretofore made, in your redirect examination you state that opposition was encountered by operators and manufacturers to the introduction of new machines, and that they disliked to make changes in machines they were using. Kindly state what means were employed to bring about the changes desired by the United Company and objected to by operatives and manufacturers.

Mr. PHILLIPS. Question objected to as containing assumptions unwarranted by the record and as being improper cross-examination.

Ans. I have made no reference to "changes desired by the United Company", although, perhaps, I should add to this statement that it is the fixed policy of the company to offer to manufacturers the best machines which can be produced for use in the manufacture of shoes. As a matter of fact, and as I have pointed out repeatedly in my previous testimony in regard to new machines, the facilities of the United Company's manufacturing plant have always been taxed to the limit in building new machines as they have been introduced from time to time, and in the case of every machine the company has always been seriously embarrassed in

supplying the urgent orders of manufacturers, and in each such case has been a long way behind its orders for years after the machines were first introduced. It is undoubtedly fortunate, from the standpoint of the United Company, that all manufacturers do not wish to change their machines immediately upon the introduction of a new and improved machine, as the company's manufacturing facilities would not be adequate to change all machines immediately.

Mr. WEBSTER. Answer is objected to as evasive and non-responsive.

Cross-Int. 436. I observe that you state in your last answer that "it is the fixed policy of the company to offer to manufacturers the best machines which can be produced for use in the manufacture of shoes". Do you mean by that portion of your answer that the United Shoe Machinery Company is the only concern in existence that can furnish "best machines" for the manufacture of shoes?

Mr. PHILLIPS. Question objected to as having no bearing on any matter introduced in the redirect testimony of this witness, or in his direct testimony, and as having no bearing on any issue triable before this examiner, which issue relates purely to patents owned and controlled by the United Company.

Mr. WEBSTER. Counsel for the petitioner respectfully calls the attention of the court to the statement voluntarily inserted in the record by the witness and quoted in the foregoing interrogatory.

Mr. PHILLIPS. Counsel instructs the witness that he is under no obligation to answer any question with regard to what other companies can do, unless so instructed by the court.

Ans. Under advice of counsel, I decline to answer the question, but I should like to state that the statement made by me in my preceding answer, and quoted in this question, was made in the course of my explanation that my testimony had been improperly quoted in the preceding question.

Mr. WEBSTER. In view of the attitude of the witness in declining to answer various cross-interrogatories propounded to him in the taking of his deposition, counsel for petitioner states that he

does not care to proceed further with the cross-examination until the question as to whether the witness shall be required by the court to answer the various questions he has declined to answer has been decided, and states that he is now waiting for instructions from his superior to determine what method of procedure to take to bring the matter to the attention of the court.

NELSON W. HOWARD.

Attest: CHARLES K. DARLING, *Special Examiner.*

[*Adjourned to 10 o'clock* A.M., *Wednesday, November 12, 1913.*]

EVIDENCE FOR THE UNITED STATES IN REPLY.

TAKEN PURSUANT TO ORDER OF COURT, ENTERED JUNE 27, 1913, BEFORE ME,

CHARLES K. DARLING,
Special Examiner.

BOSTON, MASS., November 12, 1913.

Present: ALLEN WEBSTER, Esq., *Special Assistant to the Attorney General, of Counsel for Complainant;*
BENJAMIN PHILLIPS, Esq., *of Counsel for Defendant.*

DEPOSITION OF CHARLES McCORMICK CHAPMAN.

Direct Examination by ALLEN WEBSTER, Esq., *of Counsel for Complainant.*

Int. 1. Are you the same Charles McCormick Chapman who has heretofore testified in this case?

Ans. I am.

Int. 2. The defendant the United Company has offered evidence in the effort or tending to show that a large number of machines were, in the commercial manufacture of shoes, essential (prior to the date of the filing of the bill herein) in the bottoming of shoes by machinery in accordance with the so-called Goodyear process. Have you studied the art of bottoming shoes by machinery sufficiently to enable you to testify what machines were, prior to said date, essential or necessary for the bottoming of welt shoes in the commercial manufacture of shoes by machinery under the Goodyear process. And, if you answer yes, state what machines were so necessary or essential.

Mr. PHILLIPS. Questions objected to as improper rebuttal, and because the witness has not qualified to express an opinion in this matter.

Ans. I have studied the art relating to the bottoming of shoes according to the so-called Goodyear process, and as a result of my

study and research am able to state that there are but two absolutely essential or indispensable machines necessary to the production of a Goodyear welt and turn shoe made in accordance with the so-called Goodyear process. Those machines are the machine which is familiarly known as welt and turn machine and out-sole rapid stitcher.

Int. 3. Now, referring to the machine designated as welt and turn machine, Mr. Howard has testified, among other things, that the welt and turn machine constructed like the welt and turn machine No. 228 at the Whitman factory, and which type of machine has been designated in the record by common consent as welt and turn machine of 1899, was constructed and operated as set forth in the following patents: —

Patent No. 412,704, October 8, 1889, French and Meyer.
Patent No. 488,505, December 20, 1892, LaChapelle.
Patent No. 518,911, April 24, 1894, Briggs.
Patent No. 561,386, June 2, 1896, French.
Patent No. 495,452, April 11, 1893, Cole.
Patent No. 317,759, May 12, 1885, French.
Patent No. 732,729, July 7, 1903, French and Meyer.
Patent No. 461,793, October 20, 1891, Briggs.

Have you examined the above noted patents; do you understand the same; have you compared the same with the welt and turn machine referred to, and can you state which of said patents might properly be termed basic?

Mr. PHILLIPS. Question objected to as improper rebuttal, because it relates to no matter touched upon by the defendants in any testimony submitted by them in their defence. And it is further objected to as calling for a special opinion on the part of this witness on a matter which is purely a matter to be determined by the court.

Ans. I have examined the said patents, some of them being patents to which I referred in my previous testimony, and I have made a comparison of said patents with the said machine. There are but two of the several patents mentioned which I would term basic, viz., the patent to French and Meyer No. 412,704, October

8, 1889, which is referred to and covers a shoe-sewing machine; and the patent to Briggs, method of forming chain stitches, No. 461,793, October 20, 1891, the said method being exemplified in the operation of the said French and Meyer patent 412,704.

Mr. PHILLIPS. Answer objected to as incompetent and immaterial.

Int. 4. State your reasons for reaching your conclusion that the two patents mentioned by you in your answer are the only ones of the group that may properly be termed basic; that is, explain why the others may not also be termed basic.

Mr. PHILLIPS. Question objected to as improper rebuttal, as entirely without the terms of the order under which issues were submitted to this examiner, as leading, inadmissible, incompetent and immaterial, because the word "basic" has no recognized or accepted meaning with reference to the subject-matter.

Ans. The two patents referred to by me, viz., French and Meyer No. 412,704 and Briggs No. 461,793, are basic because the first one refers to the fundamental organization of a welt and turn machine, and the second, because the so-called method thereof exemplifies the fundamental mode of operation of the machine covered by the first patent. The remaining patents referred to by Mr. Howard, instead of being basic or running to the fundamental organization of such machine, relate to and cover by claim mere details of construction, the majority of which may or may not be used in the basic machine, and consequently do not affect the operation of the fundamental structure of said basic machine.

Referring particularly to the patent to French No. 317,759, there is a construction shown and described which relates to needle guide and actuating mechanism, welt guide and actuating mechanism, and a so-called sticker bar and actuating mechanism. With reference to the latter structure, although I have examined a number of welt and turn machines I have never seen the same embodied therein.

Referring to the LaChapelle patent No. 488,505, it will be seen that the same relates to a tension and brake mechanism whereby when the machine is brought to a certain position, determined by a

feature of the driving shaft, the tension may be altered or released. This is a detail which may or may not be used and has no reference to the fundamental organization of the welt and turn machine.

The patent to Cole No. 495,452 refers to a combination of elements including a wax pot, stripper for the thread, and a tension so associated as to produce certain results; also a means whereby the tension may be released and applied according to certain predetermined requirements. These mechanisms may or may not be used in the fundamental machine, and, while under some conditions may be desirable, do not run to the fundamental organization.

The patent to Briggs No. 518,911 has reference to a take-up mechanism including main and auxiliary devices for operating upon the thread during certain periods of the stitch formation. While primarily this take-up mechanism may be effective and in some sense desirable in the machine, its effectiveness is more or less overcome by after conditions of the machine in which it is used, owing to the fact that operation of the auxiliary take-up is impeded, due to clogging of the parts by the wax used on the thread of the machine. In fact, I have seen one or more machines in which this auxiliary take-up was practically out of commission, due to the condition just described by me.

The patent to French No. 561,386 has reference to a heating plate arranged in juxtaposition to the looper or looper carrier and particularly covers a construction wherein the looper carrier is caused to intermittingly contact with the plate or heater block. This particular construction is a non-essential in the machine covered by the basic patent, owing to the fact that intermittent contact between the heating plate and the looper carrier is unnecessary. Furthermore, I have seen machines originally equipped with this heating plate and arranged in juxtaposition to the looper carrier devoid of such plate either because it had been physically removed by the operator, or partially devoid of the plate by reason of the fact that the operator had smashed a portion of it off with a hammer or other implement. The reason for this is that in the machine to which it was applied the heating plate or block was found to be in the way and to be an impediment to the operative in get-

ting at certain parts for the purpose of setting or resetting the same. Furthermore, it has been found that the heating system otherwise applied to the machine, and more or less encompassing the same and applied to the vital parts thereof, is amply sufficient for all the purposes in the machine during its operation.

The patent to French and Meyer No. 732,729 has reference to a thread-waxing device which may or may not be used on the machine, or any machine, and the claims of this patent run to details of construction which clearly are not necessary to the fundamental organization or basic structure of the machine covered by French and Meyer patent No. 412,704.

Mr. PHILLIPS. The answer is further objected to as being argumentative, because of lack of qualification of the witness to express any opinion in the matter in regard to which he assumes to testify.

Int. 5. Are the mechanisms referred to in the claims of the several patents to which you have made reference necessary to the successful commercial operation of the machine described in the patent termed by you basic, namely, No. 412,704?

Mr. PHILLIPS. Question objected to, first, because it is improper rebuttal; second, it is utterly without the terms of the order; third, it is leading, inadmissible, incompetent, immaterial, because the word "basic" has no recognized or accepted meaning with reference to the subject-matter; and, further, because if of any possible materiality it relates to matter to be decided by the court and not testified to by the witness, and because the witness is entirely unqualified to express any opinion as to the matters referred to in the interrogatory.

Ans. They are not.

Int. 6. Referring now to rapid out-sole stitchers, it appears from the testimony offered by the defendant the United Company that the machine designated in the record by common consent as the rapid out-sole stitcher of 1899 was constructed in accordance with patents No. 473,870, April 26, 1892, French and Meyer, and No. 474,774, May 10, 1892, French and Meyer, and in connection with such testimony various patents were introduced and testimony in reference to the same submitted. Will you kindly examine said

two patents referred to in the question in connection with the other patents introduced by the defendants (excluding, however, all reference to any patent issued after December 12, 1911), and state whether the two patents referred to in the question might properly be considered basic as compared with said machine, and as compared with the other patents introduced (exclusive of those issued after the filing of the bill herein), and give your reasons for such statement as you may make?

Mr. PHILLIPS. Question objected to, first, because it is improper rebuttal; second, it is utterly without the terms of the order; third, it is leading, inadmissible, incompetent, immaterial, because the word "basic" has no recognized or accepted meaning with reference to the subject-matter; and, further, because if of any possible materiality it relates to matter to be decided by the court and not testified to by the witness, and because the witness is entirely unqualified to express any opinion as to the matters referred to in the interrogatory.

Ans. The patents No. 473,870, French and Meyer, and 474,774, French and Meyer, are patents to which I have referred in my previous testimony and are respectively Plaintiff's Exhibits No. 212 and No. 210. The first patent, No. 473,870, comparatively speaking, is basic to the present day rapid stitcher. The patent No. 474,774 runs to a detail of construction or mechanism illustrated in the other patent, but not claimed therein in its details. The latter patent structure may be said to be a part of the former patent structure.

Since the testimony of Mr. Howard closed it has been a physical and mental impossibility for me or for counsel to go into the various patents with a view to determining their bearing on the questions at issue, but I will answer the remaining portion of the question to the best of my ability and will refer in order to the other patents which I understand were referred to by Mr. Howard. I may say, however, that I am more or less familiar with a number of these patents and the structures comprehended therein, and many of them have a very familiar appearance, since while I was in the

Patent Office I frequently had cause to examine the same and determine their structure and scope.

Referring, first, to the patent to Hadaway, reissue No. 11,578, reissued December 8, 1896 (original patent No. 549,124, November 5, 1895), which covers a welt-beveling attachment for sole-sewing machines, the combination of elements going to make up the organization of the patent structure, while probably convenient, is not essential to the fundamental organization of the rapid stitcher of patent No. 473,870.

The patent to Smith No. 553,139, January 14, 1896, has reference to details of improvement of a lockstitch machine, and while some of the claimed features might be useful in the rapid stitcher of the patent No. 473,870, provided they could be applied thereto, they are not by any means essential to said rapid stitcher.

The patent to French and Meyer, July 7, 1896, No. 563,471, has reference to a guiding mechanism which is not essential to the rapid stitcher of the patent No. 473,870, and has reference really to a means by which a certain form or shape of sole may be used as a controller in the proper location of the stitches in securing the sole to the welt. This is known in the art as the Baltimore or Scotch edge and the mechanism is more in the nature of a special attachment to machines of the rapid stitcher type.

The same is true of the French and Meyer patent, July 7, 1896, No. 563,472, and also of the patent to Shriner et al., May 11, 1896, No. 582,510.

It might be convenient at this point to refer to Defendants' Exhibit No. 109 as illustrating the Scotch edge or Baltimore type of shoe in contradistinction to such a shoe as is illustrated in Plaintiff's Exhibit No. 261.

The patent to Rush, January 16, 1900, No. 641,330, has reference to needle-lubricating device for sewing machines and is applicable to practically any sewing machine of the curved needle type and is not essential to the rapid stitcher of the patent No. 473,870.

The patent to Meloon, June 4, 1901, No. 675,783, granted on an application filed October 19, 1893, forfeited and then renewed November 22, 1899, has reference to a guiding mechanism similar

to those just referred to by me in connection with the Scotch edge shoe, and belongs in the same category with said two patents mentioned.

The patent to Hadaway, July 8, 1902, No. 704,457, has reference to a welt-beveling mechanism for shoe-sewing machines and runs particularly to means for throwing the welt-beveling mechanism into and out of operation during the operation of the machine. Such a structure, device or mechanism is not essential to the rapid stitcher of patent 473,870, although it may be convenient from a commercial standpoint.

The patent to Hadaway, July 8, 1902, No. 704,458, also refers to a welt-beveling mechanism for shoe-sewing machines and is combined with an edge gage and falls in the category with the patent last mentioned.

The patent to Richardson, October 7, 1902, No. 710,612, has reference to a different type of machine from that illustrated in the patent 473,870, and while it is conceivable that some of the claimed structure might be applied to the machine of the said rapid stitcher, such mechanism is by no means essential to the rapid stitcher structure of the said patent 473,870.

The patent to Richardson, October 7, 1902, No. 710,613, has reference to the same type of machine illustrated in the last patent mentioned and is different in type and structure from the French et al. patent structure No. 473,870. My statements relative to the last mentioned Richardson patent apply in like manner to this patent now under discussion.

The French and Meyer patent, July 7, 1903, No. 732,729, for thread-waxing device for sewing machines, is the one which I have considered in connection with the previous question relating to the welt and turn machine and, as before stated in connection with that machine, the structure of this patent is not essential to either that machine or to the rapid stitcher of the patent No. 473,870, since it has reference to a wax pot and holding and heating means for the wax.

The patent to Haradon, October 13, 1908, No. 900,925, for welt-channeling attachment for sole-sewing machines, covers a detail of

construction relative to mounting the channeling knife in combination with the stitch-forming devices of said machine and is not essential to the rapid stitcher of the patent 473,870.

The patent to Bayard, December 8, 1908, No. 906,092, has reference to a so-called apron and may or may not be used according to desire in connection with the machine of patent No. 473,870. It is by no means essential to the structure of the latter machine.

The patent to Hadaway, May 25, 1909, No. 922,696, has reference to a detail of construction running to a needle-lubricating device. It may or may not be used in the machine of the rapid stitcher type and is not essential to the latter.

The patent to Alley, August 3, 1909, No. 930,115, covers a thread-waxing device and is applicable to various types of machines, may be convenient therein, but is not essential to such a machine as that covered by the patent 473,870.

The patent to Plant, November 16, 1909, No. 940,055, has reference to a particular form of work support and guard in combination therewith, and is not at all essential to the machine of patent No. 473,870.

The patent to Plant, November 23, 1909, No. 940,723, runs to a channeling device for sewing machines, and the details of construction of said device are by no means essential to the rapid stitcher of patent 473,870.

The patent to Plant, November 23, 1909, No. 940,725, has reference to details of construction in a machine for stitching soles, while convenient and possibly desirable, are not essential to the rapid stitcher of patent 473,870.

The patent to Arnold, January 18, 1910, No. 946,591, has reference to details of construction running to the channeling knife and its arrangement with reference to the stitch-forming mechanism and welt-guiding device, and is not essential to the rapid stitcher of patent 473,870.

The patent to Hadaway, July 12, 1910, No. 963,761, refers to a mechanism for channeling the welt to receive the stitches and has reference to nothing which is absolutely essential to the rapid stitcher of patent No. 473,870.

The patent to Thayer, November 1, 1910, No. 974,309, relates to a tension device of a shuttle of lockstitch machines. This structure can be used with only certain types of shuttles used in lockstitch machines and is not essential to the rapid stitcher of patent 473,870.

The patent to Dow, November 1, 1910, No. 974,757, has reference to the same type of device as the last preceding patent, and the same remarks apply to it.

Int. 7. Are the structures or mechanism of any of the claims of any of the patents referred to by you in your last answer necessary to the successful operation of the rapid out-sole lockstitch machine of patent No. 473,870 in the commercial operation of that machine in attaching welts and out-soles in the manufacture of shoes by machinery?

Mr. PHILLIPS. The question is objected to as improper on rebuttal, referring to no matter referred to by the defendants submitting testimony before this examiner. It is further objected to as being leading and incompetent, relating to no matter at issue before the examiner, and, further, because of the utter lack of qualification on the part of the witness to express any opinion on these matters.

Ans. I cannot answer that question with reference to all the claims of all the patents referred to, for the reason that I have been unable to go through the patents in detail sufficiently to give a comprehensive answer. In making my last answer, however, I read and had in mind the structures of certain of the claims of all the patents, and in connection with my prior familiarity with a number of the patents and the structures covered thereby I can state that there is no claimed structure, so far as I have been able to determine, or so far as I know anything of the patents, which is referred to which is absolutely essential or necessary to the structure of the rapid stitcher of the patent No. 473,870.

Int. 8. I neglected in interrogating you with reference to the patents relating to welt and turn machine of 1899 to call your attention to the testimony of Mr. Howard with reference to the Briggs patent, October 20, 1891, No. 461,793, and I will now ask you whether you agree or disagree with Mr. Howard in his statement

with reference to the Briggs patent in comparing the same with the patent to Stickel No. 296,284, dated April 1, 1884, and give your reasons for the same?

Mr. PHILLIPS. Objected to as immaterial to any matter before this examiner in the trial of this cause.

Ans. I have read over hastily, in the very short time allotted to me since the close of Mr. Howard's testimony, that portion of his testimony relating to the Briggs method, the Stickel anticipation as alleged by me, and my construction of the said Stickel patents.

I do not agree with Mr. Howard in his exposition of the Stickel patent and the method of operation disclosed therein with reference to the hand implement thereof, and my disagreement is based upon two general propositions,—the first being that Mr. Howard has clearly misinterpreted the Stickel patent and the mode of operation of the implement covered thereby, and the second being that I have made a practical demonstrattion of the mode of operation of the Stickel instrument in making chain-stitches. In fact, I have used the implement made strictly in accordance with the Stickel patent, have made chain-stitches on a piece of work identical with that of the Briggs patent, and have verified in every particular all statements made by me in my previous testimony.

In order to clearly demonstrate the mode of operation described by the patent to Stickel and make a comparison thereof with the Briggs method as described in the patent No. 461,973, I have prepared a sheet of drawings which I here produce illustrating the precise character of work shown in Figs. 8, 9 and 10 of the said Briggs patent, excepting only the welt, which in that patent is indicated by the reference character *d*.

[*For convenience the sheet of drawing produced by the witness is put in evidence at this point, and marked "Plaintiff's Exhibit 263".*]

Mr. PHILLIPS. The introduction of this exhibit is objected to on behalf of the defendants, it being entirely immaterial to any issue triable before this examiner.

[*Ans. to Int. 8 continued:*]

In this sheet of drawings which I have produced I have illustrated five important positions of the Stickel implement during the

process of making a plurality of chain-stitches in accordance with the Briggs method. As before stated, I have omitted the welt because I found in manipulating the instrument with the shoe placed on a jack it was difficult for me to hold the welt while operating the implement and passing it through the several stitches illustrated by the five figures of the Exhibit No. 263.

It should be noted in passing that Figs. 1 to 7 of the Briggs method patent correspond in point of material substantially with the material or work shown in the Stickel patent, and that the figures of Plaintiff's Exhibit 263 have been made to correspond with Figs. 8, 9 and 10 of the Briggs patent and to show the last, the sole with its channel and lip upturned, the upper and a piece of lining which is usual in making shoes, the lining, however, being omitted from the Briggs drawings. In the figures of Exhibit No. 263 the "between substance" is indicated by words, while in the Briggs patent it is indicated by the reference character *e*.

Now, by comparing the figures of drawings of the Stickel patent with the figures of drawings of Plaintiff's Exhibit 263, and the three Figs. 8, 9 and 10 of the Briggs patent, the following will be apparent: —

Assuming that a plurality of chain-stitches have been made as shown in Fig. 1 of the exhibit, in Fig. 9 of the Briggs patent and in Fig. 7 of the Stickel patent, and that a loop has been drawn through from the channel side of the sole and down through a preceding loop of the finished chain-stitches, we have the implement of the Stickel patent in the position shown in "No. 7" and the position of Fig. 9 in the Briggs patent. Now, by moving the needle laterally the loop on the hook thereof is moved laterally and a new position is located for the penetration of the needle to pass through the upper, and first a welt, if a welt be used as in the Briggs patent, and then through the between substance and into the channel of the sole. In doing so the needle passes from the position of "No. . Stickel patent to the position of "No. 4" and into the position of Fig. 2 of the Exhibit 263, and the position of Fig. 10 of the Briggs patent. At this point the preceding loop indicated by *s* in the exhibit and in the Stickel patent and by *h* in the Briggs

patent is drawn down tightly about the shank of the needle by tension applied to the thread in the direction of the arrow indicated by the numeral 10, Fig. 10, Briggs patent, by the arrow at *z* of the Exhibit 263, Fig. 2, and the extreme end of the thread at "No. 4" position of the Stickel patent, this end of the thread in the other figures, "No. 5", "No. 6" and "7", being indicated by *z*.

[*Answer suspended.*]

Mr. WEBSTER. Counsel for the United States states that, in view of the vast number of patents introduced by the defendants and the utter impossibility of examining the same and preparing to proceed in the limited time given, it is desirable that an adjournment be now taken until the 14th instant to enable counsel and the expert to examine the patents as far as possible during the interval.

[*Hearing adjourned to 10 o'clock* A. M., *Friday, November 14, 1913.*]

BOSTON, MASS., November 14, 1913.

[*Answer to Int. 8 continued:*]

In this position of the parts the preceding loop which has been drawn taut about the shank of the needle is also drawn snugly against the face of the work. It will also be clear that the precise direction of strain or tension upon the thread is not of the essence of the Briggs method, nor of the operation of the Stickel implement. However, such tension or direction of pull for the purpose of drawing the preceding loop or first loop against the surface of the work and around the shank of the needle may be such as will necessarily bring about the result required and, at the same time, or in direct sequence therewith, the thread may be wrapped about the holder *d* of the Stickel instrument and then about the needle thereof so as to place the thread in the hook of said needle and thereby form the second loop indicated by S' in Fig. 3 of Plaintiff's Exhibit (drawing) 263, and in "No. 5" position of the Stickel patent, the corresponding position in the Briggs patent being illustrated in Fig. 8 of the drawings thereof. The implement will now be retracted, referring to Plaintiff's Exhibit (drawing) No. 263, in the direction of the arrow 3, Fig. 4, the thread being held under tension at Z while the instrument is being withdrawn. A corre-

sponding position in the Stickel patent is shown in the "No. 6" position. There is, however, no corresponding position in the Briggs patent drawings.

During the retracting movement of the implement as just described the second loop S' is gradually drawn into the between substance through the lining and the upper and into the position of Fig. 5, Plaintiff's Exhibit (drawing) No. 263, preparatory to the lateral movement of the instrument to assume the position of that figure. This operation results in drawing in the second loop of thread S' of the Stickel patent into the position of No. 7 of that patent, a corresponding position being shown in the Briggs patent at Fig. 9. The thread, during this operation, is, of course, under more or less tension at the point Z, Plaintiff's Exhibit (drawing) No. 263 and Stickel patent, and the result is that the second loop S' is also drawn through the preceding loop S preparatory to shifting the instrument laterally to locate another needle-penetrating position, this latter position being shown in Fig. 5 as well as in Fig. 1 of Plaintiff's Exhibit (drawing) No. 263 and the "No. 7" position of the Stickel patent. In carrying out this method with the implement upon work precisely as illustrated in Plaintiff's Exhibit (drawing) No. 263, I used both unwaxed and waxed thread. Waxed thread being the usual condition in sewing shoes, I used that more frequently, and in each instance found that it was a physical impossibility for the thread at any stage in the manipulation of the instrument to reeve or slide in the hook of the needle. In using unwaxed thread more tension was required at the point Z during the manipulation of the instrument to prevent reeving, but reeving was prevented by the proper manipulation of the thread at all points in the manipulation of the instrument.

Now, with reference to Plaintiff's Exhibit (drawing) No. 263, and in order to nail the Stickel mode of operation fast to the Briggs method, I will read the latter upon said Exhibit No. 263, wherein according to the first step of the Briggs method the loop S, Fig. 1 of the exhibit, has been drawn through the material or a hole therein to the position shown in said figure. The next step is "inserting an instrument through the loop and holding the instru-

ment in a second hole in the materials at the point desired for the next stitch". This is illustrated in both Figs. 1 and 2 of the exhibit drawing wherein the instrument holds the loop S by its hook and in the Fig. 2 position the instrument is inserted and held in a second hole in the materials at the point desired for the next stitch. The next step of the method is "drawing on the supply end of the thread, thus drawing the loop that is now around the instrument against the materials". This step is illustrated by both Figs. 2 and 3 of the exhibit drawing, wherein, first, the tension is applied at the point Z to the thread, Fig. 2, to draw the loop S about the shank of the needle and snugly against the face of the work and, at the same time or by a continuous operation, the second loop S' is formed as shown in Fig. 3. The next step is "forming another loop from the supply thread on the opposite side of the materials", this step being, as before stated, illustrated in Fig. 3, wherein, by the succeeding or continuous operation of drawing in the preceding loop S, the succeeding loop S' is thrown about the holder *d* and into the hook of the needle. The next step of the method is "removing the instrument from the second hole in the materials and from the drawn down loop, and passing the second loop made from the supply thread through the second hole in the materials and through the drawn down loop". Each of these steps, as you choose, is illustrated in Figs. 4 and 5 of the exhibit drawing No. 263, wherein the second loop S' is being drawn into the materials and while the needle or instrument is being removed from the second hole in the materials, and the subsequent portion of this step is shown in Fig. 5, wherein the needle A is shown as having drawn the loop S' through the preceding loop S, by which act the needle has been drawn from the latter or removed from the latter.

It will thus be seen that every word, every step and every action of the Briggs method is exemplified in the drawings of Plaintiff's Exhibit 263, which is an exemplification of the mode of operation described in the patent to Stickel with reference to the implement illustrated therein.

I will here note that in reciting the Briggs method upon the

drawing of Plaintiff's Exhibit 263 I have, for convenience, made less subdivisions of the steps of the method than in a preceding exposition of the said method heretofore given in my testimony, this being because I found it simpler in reading the method upon the drawings of the Plaintiff's Exhibit 263 to follow the steps of the Briggs method in the manner stated by me. I will note in passing that the gist of the Briggs method lies in preventing as much as possible the reeving of the thread against the between substance in the formation of the chain-stitches and, in so doing, drawing the loop or loops of thread snugly against the face of the work and in the channel of the sole and tightly around the needle shank or stock.

Int. 9. In order to have your answer briefly stated, I have to say that it is my understanding that you testify that the method of the claim of the Briggs patent is shown and anticipated in the prior patent to Stickel. Kindly state if I am correct in my understanding.

Mr. PHILLIPS. Question objected to as improper rebuttal, as leading, as immaterial to any issue triable before this examiner, and as calling upon the witness for an expression of opinion on what, if of any materiality at all, would be purely a matter of law for the court.

Ans. You are correct.

Int. 10. Have you knowledge of any statements by way of advertisement or reports of the United Company or its officials which tend to support your statement that welters and stitchers are the only indispensable machines required for the commercial bottoming of shoes by machinery?

Mr. PHILLIPS. Question objected to as improper rebuttal and as immaterial to any issue triable before this examiner, and as calling for secondary evidence, and being incompetent and irrelevant.

Ans. I found in the record, at page 1141 of plaintiff's exhibits, Plaintiff's Exhibit 167, which is, I believe, a portion of the annual report of President S. W. Winslow to the stockholders of the United Shoe Machinery Corporation of June 17, 1911. In this exhibit there occurs the following: —

"In constructing a Goodyear welt shoe which is the highest type of shoe now generally worn, the indispensable machines which the company supplies exclusively are the Goodyear welt machine and the Goodyear stitching machine. These are the machines by which the sole and the upper are sewed together after the manner in which they would be sewed by hand."

By this I understand the welt and turn machine and the rapid stitcher to be referred to.

Int. 11. In the commercial manufacture of shoes by machinery, what machines are of secondary importance in the bottoming of shoes?

Mr. PHILLIPS. Question objected to as improper rebuttal and as having been fully gone into by counsel for petitioner in his opening case before the examiner, and as immaterial and incompetent and outside the scope of the order upon which proofs are being taken before this examiner.

Ans. The machines of secondary importance are a machine for insole channeling, a machine for lasting, a machine for sole laying, a machine for rough rounding and channeling, a machine for heel-seat nailing, and such machines as are ordinarily employed in the heeling operation generically considered, a machine for edge trimming.

Int. 12. I notice you omit from the list machines for leveling or beating soles. Are they properly included in the list of secondary machines?

Mr. PHILLIPS. The same objection.

Ans. They may be considered of secondary importance.

Int. 13. Mr. Howard has testified at some length in behalf of the defendants in reference to insole channeling machines and in reference to patents relating to insole channelers. If you have knowledge of any patents which tend to limit the scope of any of such patents put in evidence by the defendants, will you please specify the same and state the relation of such patents to the patents put in evidence by the defendants, and if patents commented upon by you as anticipatory show any prior structure adapted for channeling insoles, point out the same and in that connection state whether such patents may be considered basic or anticipatory with reference

to the patents introduced by the defendants, and give your reasons for same.

Mr. PHILLIPS. Question objected to as entirely without the scope of the order of the court under which this testimony before the examiner is being taken, and for the further reason that the word "basic" has no proper definition in the art, and, further, because if of any materiality it is a question of law for the court.

Ans. As heretofore stated, I have had very little opportunity to study or go into the prior state of the art having reference to or bearing upon those patents to which Mr. Howard has made reference, but in answer to the question I refer to the patent to Wellington No. 454,631, June 23, 1891, for channeling machine, which shows a structure involving the fundamental principles required for the purpose of insole channeling. This patent, in its claims, calls for details of construction, but those details are embodied in a fundamental organization or structure which, in a generic sense, is essential to all insole channeling machines. The various patents referred to by Mr. Howard also run to details of construction in their claims, and while the claims of such patents may not be specifically answered by this patent to Wellington, or the structure shown therein, nevertheless the Wellington structure is such as to lay the field of insole channeling wide open to the public and prevent any basic claim or generic claim in any of the said patents referred to by Mr. Howard, if such claims existed, from being valid. As before stated, the Wellington machine as illustrated in the patent marks substantially the foundation of the present day insole channelers. By this I do not mean to be understood that the insole channelers of the present day structure are not more effective or more convenient from the commercial standpoint than the Wellington machine, but simply that the latter machine may be taken as an exemplification of a pioneer structure upon which all present day structures are founded.

Mr. PHILLIPS. Answer objected to as involving merely guesswork on the part of the witness, and statements purely of matters which, if of any materiality, would be questions of law for the court.

[*Counsel for petitioner offers the Wellington patent testified to by the witness in evidence, and asks that the same be marked "Plaintiff's Exhibit 264".*]

Mr. PHILLIPS. Please note my objection to this exhibit as immaterial and as having no bearing on any issue triable before this examiner.

Int. 14. Mr. Howard has testified in behalf of the defendant the United Company with reference to lasting machines of the type known as Chase lasters. Will you kindly state whether you have knowledge of any of the art existing prior to the patents introduced in behalf of the defendants under the head of "Chase lasters" and testified to by Mr. Howard, and state how the same affects the scope, etc., of the said patents referred to by Mr. Howard, to the exclusion, however, of any patent issued after December 12, 1911, and in connection with such answer you may comment upon the patents introduced by the defendants dated as late as January 10, 1888, as found in Defendants' Exhibit 150.

Mr. PHILLIPS. Question objected to on the ground that the matter inquired about is beside any issue triable before this examiner, and for the further reason that if of any materiality the question of scope of any of the patents referred to is a question of law for the court and not properly addressed to an expert witness.

Ans. I have found it unnecessary to go outside of, or beyond, the art brought into the case by Mr. Howard as I understand it; that is to say, Mr. Howard has referred to a number of very early patents relating to lasting machines as shown in Defendants' Exhibit No. 150 preceding those patents granted to Chase on such machines, and from which the machine in question takes its name. The various patents referred to by Mr. Howard and granted to Purinton,—

No. 25,673, October 4, 1859;

No. 1,382, reissued January 6, 1863, Purinton;

No. 28,120, May 1, 1860, Wells;

No. 41,967, March 15, 1864, Wells;

No. 44,916, November 1, 1864, Fischer;

No. 90,651, June 1, 1869, Fischer;

all show lasting machines and devices and mechanisms to be used

in lasting machines which are clearly of pioneer character from the mechanical lasting standpoint. These patents clearly constitute a prior state of the art in view of which patents on such structures as are shown in the patents to Chase No. 340,860, April 27, 1886; No. 364,088, May 31, 1887, Chase, and the succeeding patents in the same exhibit, Defendants' Exhibit No. 150, are necessarily limited. Some of these patents referred to by Mr. Howard, and forming the Defendants' Exhibit 150, I have heretofore commented upon in my previous testimony, and it requires but a cursory glance at the claims of the said patents to determine the fact just stated by me with reference to the prior art.

I may note in passing that the patent to Chase No. 571,339, dated November 17, 1896, and entitled "Lasting Machine", contains a claim covering a structure which I have several times carefully examined both on the Chase lasting machines at the factory of the Shoe & Leather Company at Whitman, Massachusetts, and at the Long factory at South Framingham, Massachusetts. This structure has reference to the means by which the sidewise tiltable carriage may be locked from tilting, — said means being indicated at 21, Fig. 1, of the drawings of said patent No. 571,339, consisting of a couple of arms on the ends of a transverse shaft adapted to be raised and lowered for the purpose of engaging and disengaging the bottom of the tiltable carriage. I have been unable to discover that this structure has any real commercial value, and I have been unable to find a single operative who, if he knew the device were in the machine, ever used it for any purpose. In fact, every operative of whom I have inquired, and this runs to all the machines which I have examined, has, in the first instance, been unable to tell me the function of the device, and in each instance has looked with astonishment at the structure when I pointed it out to him. Each in turn said he had never used it, and each in turn would speculate upon its value. I may add that in not one of the machines examined by me did I find this device in actual use, and at no time during the process of lasting a shoe did any of the operatives either use it, or apparently find any use for it.

Mr. PHILLIPS. All that portion of the answer relating to alleged conversation of operatives is objected to as hearsay.

Int. 15. Mr. Howard has testified at considerable length with reference to sole-laying machines, sole-leveling machines, and sole-beating machines, and in connection with such testimony there was introduced, and he has commented upon, the various patents. Have you knowledge of any patents prior to those comprising Defendants' Exhibit 120 (excluding all reference to patents issued after December 12, 1911), showing devices adapted for accomplishing the results testified to by Mr. Howard as shown in said patents? And, if so, state what such prior patents are, and state the relation of the same to patents of said exhibit, exclusive, as before stated, of any patent issued after December 12, 1911.

Mr. PHILLIPS. Question objected to as outside the scope of the order of the court under which this testimony is being taken, and as immaterial and incompetent.

Ans. Within the short time allotted to me I have been unable to make an extensive examination of the arts of sole laying, leveling and beating, but I have found one patent which is long prior to any of those mentioned by Mr. Howard and included within Defendants' Exhibit 120, the same being the patent to Cutcheon No. 384,893, June 19, 1888, entitled "Beating Out Machine".

Preliminarily, I will state that I understand the terms "beating", or "beating out", or "leveling", to be synonymous. The term "laying", or "sole laying", however, does not mean the same thing as beating and leveling.

The patent to Cutcheon shows a structure, however, which may be used as a sole-laying machine, although primarily and fundamentally constructed for the purpose of beating or leveling the sole. This machine is duplex in character, or is what is known in the art as a "gang" machine, and includes the fundamental idea of means of holding the shoe for leveling or beating in position to receive the direct pressure of a die or mold. This patent also includes in its structure the fundamental idea of means of presenting the shoe alternatively to the operator and to the press or leveling device. This patent to Cutcheon No. 384,893 may be described

as a pioneer and as containing a basic claim, and in this connection I refer particularly to claim 1.

Most of the patents referred to by Mr. Howard I note are of the type which may be termed "roller pressure" machines, in contradistinction to the type illustrated by Cutcheon patent No. 384,893, which is of the direct pressure type. Notwithstanding this fact, the fundamental principle involved in the two types of machines is the idea of means of smoothing or rendering uniform the surface of the sole of a shoe, and runs to the idea of reducing the hills of the sole to the dales thereof, which in practice are more or less prominent. It makes no difference in the fundamental operation whether the pressure for this purpose is applied by the rolling or sliding action of the devices employed in the patents referred to by Mr. Howard, or by the direct pressure at a right angle to the sole as in the Cutcheon patent. As before stated, I look upon the Cutcheon patent and the claims thereof as pioneer and basic and as a direct limitation upon all those patents referred to by Mr. Howard and embodied in the Defendants' Exhibit No. 120.

I may note in passing that at the Whitman factory I examined one of the sole-leveling machines and commented on the same in my previous testimony, and found that it involves the fundamental principle of such patents as are referred to by Mr. Howard in the Defendants' Exhibit 120, and particularly the patent to Winkley et al. No. 540,222, May 28, 1895, No. 540,223, May 28, 1895, Winkley et al., and others of similar type, of later date, included in the said Defendants' Exhibit 120.

The machine at Whitman is of the gang type, that, is, it is duplex in that it employs a pair of rollers and a pair of shoe supports operated so as to alternately present the shoe to the operator and to the roller by the leveling operation.

I note that a good deal has been said in some of the patents of Defendants' Exhibit 120 relative to the automatic operation of the roller pressure means which enables the machine to operate so as to come to a stop at certain times, so as to present the shoe for removal, and another one to be placed in convenient position for the operator. The machine at Whitman was so constructed as to

carry out this operation, but the mechanism for doing the work just described was blocked out of operation. By this I mean that, although the clutch and the mechanism for operating the same were in the machine, and capable of carrying out the operation intended, nevertheless the operator had blocked the clutch members into constant contact so that the machine actually continuously operated, thereby eliminating the automatic stopping and starting.

Int. 16. Mr. Howard has testified in behalf of the defendants at considerable length with reference to rough rounding and channeling machines, and in connection with such testimony there was introduced various patents with reference to which Mr. Howard testified. Kindly state whether you have knowledge of any prior art or whether you find in any of the patents forming a part of Defendants' Exhibit 116 any structures of patents containing basic claims or open to a construction of a pioneer or anticipating patent relating to the art as disclosed in said patent. Will you please note that the inquiry eliminates any comment by you with reference to any patent issued after December 12, 1911?

Mr. PHILLIPS. Question objected to as being outside of the order of the court, as being incompetent and immaterial because the word "basic" has no proper definition in the art, and because if the subject-matter of the interrogatory is of any materiality it is a question of law for the court and not a proper subject of interrogatory addressed to an expert witness.

Ans. I have examined all the patents referred to by Mr. Howard and included within the Defendants' Exhibit 116, and find among them a couple of patents to which I referred in my previous testimony, viz., the patent to Briggs, November 24, 1891, No. 463,982, and Briggs et al. No. 511,263, December 19, 1893. Primarily, I look upon these two patents as constituting a state of the art prior to all the other patents referred to by Mr. Howard in the said Defendants' Exhibit 116, in view of which the said other patents are necessarily limited and subordinated in the matter of their structure and their claims.

These two patents run to the fundamental organization of a rough rounding and channeling machine, and the arrangement of

knives or cutters for the purpose of channeling and trimming the sole. The later of the two patents, viz., No. 511,263, also discloses a guiding mechanism of duplex character for the purpose of gauging the operation of the knife or knives relatively to the edge of the sole or the upper of a shoe, and may be interesting from the standpoint of the so-called improvement in guides or gauges for producing the work of the Baltimore edging attachment, or Scotch edging attachment, or extension sole attachment applied to the rapid stitcher.

As anticipating all of these patents, however, because of its prior date and fundamental structure, I note the patent to Turner, dated September 21, 1880, No. 232,382, for a machine for channeling and trimming boot and shoe soles. This patent contains a structure fundamental in character for channeling the sole and trimming the edge thereof, and the claims of this patent are basic or generic in character. In view of this prior patent illustrating an early state of the art, all the patents referred to by Mr. Howard are necessarily subordinate and should or must necessarily, in their claims, run to details of construction and limited features of invention.

[*Patent to Turner, machine for channeling and trimming boot and shoe soles, September 21, 1880, No. 232,382, referred to by the witness, is offered in evidence, and counsel asks that the same be marked "Plaintiff's Exhibit 265".*]

Mr. PHILLIPS. Please note my objection to the exhibit as immaterial to any issue within the order of the court.

Int. 17. Mr. Howard has testified at considerable length with reference to welt beaters, and in connection with such testimony various patents have been introduced and commented upon. Kindly state whether you have knowledge of any patent in the art prior to those commented upon by Mr. Howard and introduced in evidence by the defendants, or whether you find among those introduced by the defendants and commented upon by Mr. Howard, same being shown in Defendants' Exhibit 170, any patent which shows the operative device in welt beaters which is in the nature of a pioneer patent or disclosure containing a claim or claims basic in character, and compare the same with the remaining patents in said exhibit.

Mr. PHILLIPS. Question objected to as outside the order of the court, and for the reason that the term "pioneer and basic" has no proper definition in the art, and if the matter inquired about is of any materiality it is a question of law for the court.

Ans. Among the patents referred to by Mr. Howard, and included within the Defendants' Exhibit 170, I find the patent to Littlefield No. 320,075, June 16, 1885, machine for beating out welts. This patent discloses in the drawings, and describes in the specification, a fundamental organization adapted for beating out welts, now commonly known as "welt beaters". The organization described and illustrated is covered by a very generic claim in the said patent, which is as follows: —

"1. In a machine for beating out welts attached to the uppers and soles of boots and shoes, the work support shaped to enter the space between the upper and its attached welt, combined with an automatically reciprocated hammer to hammer the said welt, substantially as described."

In view of this very broad claim, all other patents referred to by Mr. Howard and included within the said exhibit No. 170 are necessarily directed to subordinate specific structures and are necessarily classed as mere improvements in the art. This patent, with reference to all the other patents referred to by Mr. Howard, is necessarily a pioneer.

Mr. PHILLIPS. Answer objected to as involving expression of opinion on a question which, if of any materiality, would be purely a question of law.

Int. 18. Mr. Howard in testifying in behalf of the defendant the United Company has referred at considerable length to Amazeen skivers, and in connection with such testimony various patents were introduced by the defendants. Will you kindly examine the patents comprising Defendants' Exhibit 130, and state what you find with reference to the prior art as disclosed in those patents, as compared with those which had not expired December 12, 1911.

Mr. PHILLIPS. Objected to as improper rebuttal and outside of any issue triable before this examiner, and as incompetent and immaterial.

Ans. Among the patents referred to by Mr. Howard, and included within Defendants' Exhibit 130, I find the early patent to Amazeen, dated February 26, 1878, No. 200,682. This patent includes in its organization, as shown in the drawings and described in the specification, a structure fundamental in character and adapted for skiving or shaving leather or other materials. The claims of this patent run to the fundamental organization of a leather skiving machine and relate to the arrangement of the cutter, the bed and the feed. This patent embodies in its structure the general principles of the present day Amazeen skiver and other skivers, and the subsequent patents referred to by Mr. Howard in the said exhibit, beginning with the patents of 1898, are necessarily directed to improvements and the claims thereof are necessarily subordinately specific to the claims or claimed structure of the said early Amazeen patent first referred to by me.

Other patents referred to by Mr. Howard in the said Exhibit No. 130 are Dunham, May 26, 1891, No. 452,996, and Bayley, April 24, 1894, No. 518,774. These two patents relate to the same fundamental organization as the early Amazeen patent and contain features of addition with reference to the said Amazeen structure, and claims directed to said additional features are more or less specific. The early Amazeen patent, with reference to the later patents offered by Mr. Howard, is clearly fundamental in character and answers to the term or expression "pioneer".

Int. 19. Mr. Howard in his testimony in behalf of the defendant the United Company has testified at some length with reference to heeling machines and machines for attaching heels, etc., and in connection with such testimony various patents have been introduced upon which he has commented. Will you kindly examine the patents comprised in Plaintiff's Exhibit 251A and 251B, being patents specified in the lease agreement Plaintiff's Exhibit 240, and state what you find with reference to the art of heel attaching, and generally what you find disclosed in the patents of that exhibit as affecting the art testified to by Mr. Howard, and, if convenient, kindly classify the patents of said exhibit briefly?

Mr. PHILLIPS. Objected to as improper rebuttal and outside the scope of the order of the court.

Ans. In the Plaintiff's Exhibit 240 there are listed in Plaintiff's Exhibits 251A and 251B a great many patents relating to heeling machines, and I believe the number is approximately 300. The Plaintiff's Exhibit 240, as I understand it, is a lease conveying to the lessee the right to use two particular machines, one indicated as McKay heel compressing and loading machine and the other indicated as rapid nailing machine, the first machine being given the number in the lease 34 and the second being given the number in the lease 2555. As before noted, there are upwards of 300 patents stated in this lease, and the lease contains the following paragraph: —

"Fifth: The lessee hereby agrees as an essential part of the consideration for this lease and license, that he will not in any way violate or infringe or contest the validity of any of the patents hereinbefore referred to as belonging to the lessors or which may now or hereafter be owned by the lessors, or any reissue or extension of the same, or the title of the lessors to said patents or any of them."

I have examined all of the patents referred to in the lease of Plaintiff's Exhibit No. 240 and have attempted to make a general classification of the subjects-matter of the said patents. I may note in this connection that I have not classified the patents according to claimed structures, but simply according to general subjects-matter. Among the patents I find the following: —

Nineteen patents running to nail making and distributing machines, machines for making nail strips of flexible character, and machines which in structure are more or less allied to nail-making machines or have combined therewith other structures such as driving mechanism. These patents run, in date, from the year 1886 to the year 1889.

Four patents for burnishing tools or heel-burnishing machines or burnishing machines generally, the dates of which run from the year 1883 to the year 1897.

One patent for a machine for finishing heel bottoms, the date of which is in the year 1884.

Twenty-six patents having reference to trimmers or cutters for heeling machines, guards for the cutters, and in most instances rotary heel-cutting devices. These patents range in date from the year 1886 to the year 1893.

One patent for a heel-cutting die, dated in the year 1889.

One patent for a heel-filing machine, dated in the year 1888.

Two patents for a heel-breasting machine, dated in the years, respectively, 1881 and 1893.

Three patents for heel-loading machines, granted in the years 1886 and 1888.

Six patents for so-called top-lift holders, or heeling machines, or holders for such machines, or top-lift plates for use in such machines, the dates of which range through the years 1889 and 1890.

Seven patents for jacks, heeling blocks, last supports and similar devices, ranging through the years 1882 to 1894.

Four patents for nail distributors for heel-nailing machines, some of them also including driving mechanisms, these patents ranging through the years 1885 to 1887.

Four patents for machines for assorting nails, or nail-arranging devices, the dates of which are in the years 1887 to 1893.

One patent for machinery for assorting pieces of leather, dated in the year 1880.

Twenty-four patents for heel-trimming machines and sole-edge trimming machines, these patents running to a more or less general structure and ranging through the years 1882 to 1891.

Two patents for machines for feeding and attaching rands to boots or shoes, dated in the years, respectively, 1889 and 1892.

Two patents for heel-nailing machines, dated in the years, respectively, 1888 and 1892.

Nine patents for heel-attaching machines, ranging through the years 1881 to 1893.

Fifteen patents for heeling machines, so called, and apparently running to general subject-matter with reference to heel-attaching mechanisms, these patents ranging through the years 1882 to 1893.

Two patents on pegging machines, dated, respectively, in the years 1884 and 1888.

One patent for apparatus for assembling heel lifts, dated in the year 1889.

One patent for the method of making heel nail plates, dated in the year 1885.

Fifteen patents for the method of forming and attaching heels, running to different modes or processes for producing the functions stated, these patents ranging through the years 1887 to 1892.

Three patents for the method or process of laying out-soles or attaching soles, or attaching heels, ranging through the years 1885 and 1887.

Three patents for the method of manufacturing heels and for the so-called article spring-heel blanks, these patents ranging through the years 1886 to 1889.

One patent for the method of making rotary-toothed cutters, dated in the year 1893.

Two patents for the method of forming heel rands, dated in the year 1887.

Two patents for the process of making headed nails, or slugs, for shoes, dated in the years 1887 and 1892, respectively.

One patent for the process of manufacturing loaded heel blanks, dated in the year 1888.

One patent for so-called spring-heel boot or shoe, dated in the year 1889.

One patent for a heel blank, dated in the year 1891.

One patent for a machine for forming a pile of heels, or a heel pile, dated in the year 1880.

One patent running to a boot or shoe structure, dated in the year 1886.

Five patents for machines for molding and compressing heels, or for heel forming and attaching machines, ranging through the years 1881 to 1888.

Eight patents for heel forming and loading machines, ranging through the years 1888 to 1894.

Four patents for nail-feeding implements or separating and feeding machines or apparatus, ranging through the years 1888 to 1895.

Seven patents covering nail strips, so called, ranging through the years 1885 to 1892.

One patent for a nail holder or carrier, dated in the year 1885.

Two patents for nail dies to be used in heeling machines, dated in the years 1888 and 1889, respectively.

Eleven patents running to different structures of nails or fastenings for the heels of boots or shoes, and ranging through the years 1885 to 1892.

Three patents for nail distributing and feeding machines, dated in the year 1888.

Ninety patents for heel-nailing machines, including a myriad of structures, arrangements, mechanisms and devices in heel-attaching machines generally.

I have made no attempt, in the short time allotted to me, to determine in any manner the scope of the claims of these various patents, and have directed my attention, in consequence, simply to a general classification of the patents included within the lease of Plaintiff's Exhibit No. 240, and ostensibly running to the two leased machines to which I have heretofore referred.

I may add in this connection that, with the same idea in mind as stated by me in the foregoing, I have also examined some other leases, samples of which have been made exhibits by the petitioner, and note particularly the Plaintiff's Exhibit No. 26. This exhibit is simply a sample of lease and apparently runs to no particular lessee, but seems to be general in form. I have not been able to examine all the patents referred to in this lease, which I believe are upwards of 254, but have been able to obtain, in the short time allotted to me for the purpose of my testimony, only 138 of the patents. I have made the same general classification in connection with these 138 patents of the Plaintiff's Exhibit 26, and find among the same approximately twenty-six congeries of inventions, that is to say, there are twenty-six types or groups of machines or subjects-matter of invention among the said 138 patents of the said exhibit. I will make no attempt at this time to indicate the various groups of patents under their titles, but simply refer to the same as an example of the patents included within

such leases as have come to my notice as having been made between the defendants as lessor and certain purchasers of the defendants' machines as lessees.

Mr. PHILLIPS. Answer objected to as irresponsive to the interrogatory and volunteered on the part of the witness, as relating to matters entirely without the order of the court, and as assuming to construe written instruments, which construction, if of any materiality, would be purely a question of law for the court.

Mr. WEBSTER. This will close the direct examination of this witness unless through inadvertence, accident or mistake counsel for the petitioner has omitted to interrogate the witness, and as to such matters he will pray the indulgence of counsel and of the court, if necessary, at some later period. Counsel for defendant is invited to cross-examine.

[*Adjourned to 10 o'clock* A. M., *Tuesday, November 18, 1913.*]

BOSTON, MASS., November 19, 1913.

Mr. WEBSTER. Counsel for the petitioner states that he was, on Monday last, advised by telephone by counsel for defendant that counsel for defendant did not wish to cross-examine Mr. Chapman, the last witness produced by the petitioner, and that the witness' signature to the deposition will be waived and he need not be produced at this sitting.

Mr. PHILLIPS. Counsel for defendant repeats this statement.

[*Signature waived.*]

Attest: CHARLES K. DARLING, *Special Examiner.*

DEPOSITION OF LAWRENCE BANNICAN.

Direct Examination by ALLEN WEBSTER, Esq., *of Counsel for Complainant.*

Int. 1. Your name is Lawrence Bannican, and you reside in Whitman, Massachusetts?

Ans. Yes, sir.

Int. 2. Where are you now employed?

Ans. At the Commonwealth Shoe & Leather Company, Whitman.

Int. 3. For how many years have you worked in the factory at Whitman?

Ans. Thirty-one years.

Int. 4. Have you during your employment operated machines known as "welt and turn machines"?

Ans. Yes, sir.

Int. 5. For how many years have you operated welt and turn machines?

Ans. Twenty-four.

Int. 6. Please examine the photograph I now hand you, the same being marked "Plaintiff's Exhibit 232", and state whether it is, to your knowledge, a photograph of a machine in the factory in which you are employed.

Ans. [*Witness examines exhibit.*] Yes, sir.

Int. 7. Do you know the number of the machine of which said exhibit is a photograph?

Ans. Yes, sir.

Int. 8. What is the number of the machine?

Ans. 228.

Int. 9. State whether the welt and turn machines operated by you were like said machine 228.

Ans. Yes, sir.

Int. 10. How many welt and turn machines like said machine No. 228 are at the factory of the Commonwealth Shoe & Leather Company at Whitman, Massachusetts, where you are employed?

Ans. Twelve.

Int. 11. Please examine the copy of patent to Z. T. French, sewing machine, dated June 2, 1896, No. 561,386, which I now hand you, and state whether you understand the construction of the looper-heater mechanism shown in the drawings of said patent.

Mr. PHILLIPS. Question objected to as outside the order of the court, and because the witness is not qualified to express any opinion with regard to constructions shown and described in Letters Patent.

Ans. I do.

Int. 12. Please state whether the twelve welt and turn machines

at the factory at Whitman where you are employed are equipped with looper-heater mechanism such as is shown in the drawings of the patent referred to in the last question.

Mr. PHILLIPS. Objection repeated.

Ans. Well, they are, part of them, broken off.

Int. 13. How many are broken off?

Ans. There is five in the twelve.

Int. 14. State, if you know, whether any of the heater blocks or plates in any of the machines at the Whitman factory come in contact, when the machine is in operation, with the looper carrier lever.

Mr. PHILLIPS. Objection repeated.

Ans. No, sir, they don't.

Int. 15. You say in a previous answer that some of the plates of the looper-heater mechanism were broken off; please state what part of the plate was broken off.

Mr. PHILLIPS. Objection repeated.

Ans. Well, it is the front part, facing the machine.

Int. 16. Is the front part referred to by you the part of the heater block or plate that extends to a position to heat the looper carrier if the plate was intact?

Mr. PHILLIPS. Objected to as leading, and for the reasons heretofore stated in connection with the objection to the preceding interrogatory.

Ans. Yes, sir.

Int. 17. State the length of the part of the heater block or plate which has been broken off, as stated by you.

Ans. Well, I should answer that it was possibly an inch or an inch and a half.

Int. 18. State whether you have operated a welt and turn machine having the heater plate complete and not broken off.

Ans. Yes, sir.

Int. 19. State whether you have operated a welt and turn machine having the heater block or plate broken off.

Ans. Yes, sir.

Int. 20. State whether the machine operates any differently with the plate on or off.

Ans. I don't see any difference.

Int. 21. For how long have you operated a welt and turn machine of the kind testified to by you wherein the heater plate was broken off?

Ans. Somewhere in the neighborhood of eight or nine years.

Int. 22. Are the twelve welt and turn machines referred to by you at the Whitman factory provided with any plates upon which there is any marking or lettering?

Ans. There are plates; United Shoe Company plates, and Goodyear Shoe Company plates, I think.

Int. 23. State how many, if you know, are marked with the United Company plates.

Ans. There are four with the United Shoe Machinery plates and no others; five machines with Goodyear plates on and no others; three machines with Goodyear and United Machine plates.

Int. 24. Please examine the copy of patent I now hand you, the same being patent to H. Briggs, take-up shoe sewing machines, dated April 24, 1894, No. 518,911, and state whether you understand the construction as shown in the drawings of said patent, especially with reference to the spring-pressed plunger marked "*d*".

Mr. PHILLIPS. Objected to as improper rebuttal, as outside the order of the court, and because the witness is not qualified to express any opinion with regard to constructions disclosed in Letters Patent.

Ans. [*Witness examines the patent and says:*] Yes, sir; I do.

Int. 25. State whether the twelve welt and turn machines at the Whitman factory are provided with a spring-pressed plunger mechanism like that shown in the drawings of the patent examined by you.

Mr. PHILLIPS. The objection to the preceding interrogatory is repeated.

Ans. No, sir.

Int. 26. State whether any of the twelve welt and turn machines referred to by you were ever, to your knowledge, provided with the spring-pressed plunger mechanism referred to.

Mr. PHILLIPS. Same objection repeated.

Ans. Yes, sir.

Int. 27. State what changes, if any, to your knowledge, have been made with reference to the spring-pressed plunger mechanism in the twelve machines, or any of them, referred to by you.

Mr. PHILLIPS. Please note the same objection.

Ans. In some of them this plunger has been taken out and the front part filled in with a plug or screw.

Int. 28. Have you operated a welt and turn machine which was provided with the spring-pressed plunger mechanism referred to?

Mr. PHILLIPS. Question objected to as improper rebuttal, as outside the order of the court, and because of lack of qualification of the witness.

Ans. Yes, sir.

Int. 29. Have you operated a welt and turn machine which was not provided with the spring-pressed plunger mechanism referred to?

Mr. PHILLIPS. Objection repeated.

Ans. Yes, sir; I have.

Int. 30. For how long a time have you operated a welt and turn machine which was not provided with the spring-pressed plunger mechanism?

Mr. PHILLIPS. Same objection.

Ans. I could not state exactly. I operated the machine before it was ever put on there.

Int. 31. Is the machine now being operated by you provided with the spring-pressed plunger mechanism?

Mr. PHILLIPS. Same objection.

Ans. Yes, sir.

Int. 32. Have you operated any of the welt and turn machines which at one time were provided with the spring-pressed plunger mechanism after such mechanism was removed from the machine?

Mr. PHILLIPS. Objected to as improper rebuttal and outside the order of the court.

Ans. Yes, sir; I have.

Int. 33. State whether the presence or absence of the spring-

pressed plunger mechanism makes any difference in the operation of the machine.

Mr. PHILLIPS. Objected to as improper rebuttal, outside the order of the court, and immaterial, incompetent and irrelevant.

Ans. Not that I can see.

Int. 34. Do you know whether the welt and turn machine No. 228 at the Whitman factory, of which Plaintiff's Exhibit 232 is a photograph, has had a new centre head within the last few years?

Mr. PHILLIPS. Objected to as improper rebuttal, outside the order of the court, as immaterial and incompetent, and because of lack of qualification of the witness.

Ans. It has; about three years ago it had a new centre head.

Int. 35. Is the new centre head which you say was put on machine No. 228 about three years ago provided with the spring-pressed plunger mechanism?

Mr. PHILLIPS. Same objection, and further objected to as being leading.

Ans. No, sir, it is not.

Int. 36. What is the number of the machine operated by you, if you know?

Ans. 2217.

Int. 37. How long have you operated that machine?

Ans. About five years.

Int. 38. State, if you know, what number of stitches the welt and turn machine operated by you and referred to in the last answer makes per minute.

Mr. PHILLIPS. Objected as improper rebuttal, outside the order of the court, and incompetent and immaterial.

Ans. About 400.

Int. 39. Can you state, from your twenty-four years' experience in operating welt and turn machines, what is the fair average capacity of the welt and turn machine like that operated by you, by an average skilled operator in a day of nine hours?

Mr. PHILLIPS. Question objected to as improper rebuttal, outside the order of the court, and because the witness is not qualified

to express an opinion as to the matter inquired about, and as being incompetent and immaterial.

Ans. Four dozen pairs an hour.

Mr. WEBSTER. You may cross-examine.

Cross Examination (de bene esse) by BENJAMIN PHILLIPS, Esq., *of Counsel for Defendants.*

Cross-Int. 40. How long did you say you had been running machine No. 2217?

Ans. I said nearly five years; possibly more. I could not state the exact time.

Cross-Int. 41. The same machine?

Ans. Yes, sir.

Cross-Int. 42. In what condition is that machine now in regard to the looper-heating plate; is there a looper-heating plate on the machine?

Ans. It is broken off.

Cross-Int. 43. Did you break it off yourself?

Ans. Yes, sir.

Cross-Int. 44. How long ago?

Ans. I think very soon after I got the machine.

Cross-Int. 45. How much of the looper-heating plate is broken off?

Ans. From an inch to an inch and a half.

Cross-Int. 46. Do you know what the catalogue number of the looper-heating plate is?

Ans. I could not inform you.

Cross-Int. 47. Who orders the parts in the Commonwealth factory, if you know?

Ans. We tell the foreman if we want parts.

Cross-Int. 48. That is, the operator tells the foreman and then the parts are ordered through the foreman?

Ans. Yes, sir.

Cross-Int. 49. What is the name of the foreman under whom you are now working?

Ans. Harvey D. Reed.

Cross-Int. 50. Is there any system in the Commonwealth Shoe factory in regard to giving out the work to welters?

Ans. Yes, sir.

Cross-Int. 51. What is it?

Ans. It is what we call "passing the buck"; that is, a wire that is hung up in front of each man's machine. As the tacks are pulled and ready for them, he runs the shoes out and marks them, the number of them, and then he removes the buck to the next machine.

Cross-Int. 52. How many pairs of shoes does each operator get in a day, according to that system?

Ans. Twenty-four to twenty-six dozen.

Cross-Int. 53. Will you please explain a little more fully about the system of passing the buck? I do not quite understand.

Ans. The shoes are trimmed and the tacks are pulled. The tack puller gets his case ready and runs it down the line. Wherever this buck is hanging in front of a machine, he marks it to that machine. Then he goes back and removes it to the next machine. The next work that comes out goes to the next machine, and so on down the line, and then it is brought back to number one.

Cross-Int. 54. So that each operator gets a certain number of shoes, and gets them in rotation?

Ans. Yes, sir.

Cross-Int. 55. Do you know how many of the looper-heater plates have been purchased by the Commonwealth Shoe Company within the past year?

Ans. No, sir.

Cross-Int. 56. You do not know, then, to what extent they have been called for by the other operators and by the foreman?

Ans. No, sir; I don't.

Cross-Int. 57. Do you know what an auxiliary take-up is in the welt and turn sewing machine?

Mr. WEBSTER. Objected to as going into matter not touched upon in the direct examination, unless counsel shall specify that he has reference to the spring-pressed plunger mechanism when using the term "auxiliary take-up".

Mr. PHILLIPS. This question, of course, is asked *de bene esse*,

without waiving any objections, but I refer particularly to the language "auxiliary take-up" used in the Briggs patent No. 518,911.

Ans. It is to hold the slack thread.

Cross-Int. 58. What do you mean by that?

Ans. I mean it is slack thread when this take-up pulls it up. When it comes down there is a slack thread and this auxiliary comes down and holds it taut.

Cross-Int. 59. What is the object of holding it taut?

Ans. To keep it from dropping off of your needle; keep it tight on your needle.

Cross-Int. 60. Keep it from mislooping?

Ans. Skipping, as we call it.

Cross-Int. 61. What is the effect on the work done by a machine if this mislooping or skipping occurs?

Ans. It leaves skipped stitches.

Cross-Int. 62. Does it affect the quality of the work any?

Ans. Yes, sir.

Cross-Int. 63. It makes imperfect work?

Ans. Makes imperfect work.

Cross-Int. 64. Do you know what the object is of heating the looper in the machine which you state you have been running?

Ans. Yes, sir; I do.

Cross-Int. 65. What is it?

Ans. To keep it clear from wax.

Cross-Int. 66. Just what do you mean by that?

Ans. A cold looper will collect wax from the thread; stick to it; clog it up.

Cross-Int. 67. And what effect does that have on the operation of the machine?

Ans. It makes the thread draw hard; liable to snap it.

Cross-Int. 68. Liable to make the machine break thread?

Ans. Yes, sir.

Cross-Int. 69. Did you ever see a gas flame used for the purpose of heating the looper?

Ans. A gas flame in the head of the machine; yes, sir.

Cross-Int. 70. Just state briefly how it was heated with the gas flame.

Ans. It was a gas flame in the head of the machine, and I don't know whether you observed that hole in that machine right there. [*Witness points to a hole that appears in photograph, which is at the base of the head of the machine, and immediately in front thereof.*] That originally was intended for a hollow pipe, bent about that shape [*bent in about the shape of a curved finger*]. The heat comes from that, and I have run them, and it always kept it clear; always kept those parts clear. If the heat was there, it was properly heated.

Cross-Int. 71. Didn't the operators find considerable fault with that arrangement, owing to heated air rising in their faces?

Ans. It heated the machine up a great deal more, the whole machine.

Cross-Int. 72. And made it harder to run?

Ans. Not necessarily.

Cross-Int. 73. Hotter?

Ans. Made it hotter.

Cross-Int. 74. Well, isn't it true that you had to breathe the air that came up through the pipe and passed over the looper?

Ans. No; I had to breathe it some, of course, surely; the fumes from it.

Cross-Int. 75. Do you know what is meant by "operator's slip"?

Ans. As I understand, the royalty book.

Cross-Int. 76. Did you keep any record of the number of pairs of shoes sewed by you on the welt machine upon which you said you worked?

Ans. I have put them down every day; supposed to. I have them on a book, and copy them off.

Cross-Int. 77. You put down a written memorandum of the number of pairs?

Ans. Yes; figure them up every day.

Cross-Int. 78. Did you sign those memoranda or slips?

Ans. Yes, sir.

Cross-Int. 79. Will you look at the paper I now hand you and

state whether the signature in lead pencil at the bottom of the paper is your signature? [*Witness examines paper.*]

Ans. Yes, sir.

Cross-Int. 80. And to explain this memorandum, it means that on the 1st of July, 1911, you stitched 140 pairs?

Ans. Yes, sir.

Cross-Int. 81. And on the 2d day six pairs?

Ans. No, sir; that I put down to signify Sunday.

Cross-Int. 82. On the 10th, 191?

Ans. Yes, sir.

Cross-Int. 83. On the 11th, 193?

Ans. Yes, sir.

Cross-Int. 84. On the 12th, 231?

Ans. Yes, sir.

Cross-Int. 85. On the 13th, 218?

Ans. Yes, sir.

Cross-Int. 86. On the 14th, 253?

Ans. Yes, sir.

Cross-Int. 87. And so on, down the column?

Ans. Yes, sir.

Cross-Int. 88. So that the figures in lead pencil under the heading "men" represent the number of welted shoes which you sewed on a date which is given in the opposite column?

Ans. The opposite date; yes, sir.

[*Bannican slip for July, 1911, is offered in evidence, and marked "Defendants' Exhibit 204".*]

Cross-Int. 89. I show you another paper; will you please state whether the signature "L. Bannican" is your signature?

Ans. Yes, sir.

Cross-Int. 90. And that slip is of the same character; the figures in the column marked "men" indicate the number of pairs of welt shoes which you sewed on a day, the date of which appears in the first column?

Ans. Yes, sir.

[*Bannican slip of April, 1911, is offered in evidence, and marked "Defendants' Exhibit 205".*]

Cross-Int. 91. I show you a similar slip for September, 1911; will you state whether the signature that appears at the bottom is your signature?

Ans. Yes, sir.

Cross-Int. 92. That slip indicates the number of pair of men's shoes that you sewed in the month of September, 1911?

Ans. Yes, sir.

[*Bannican slip for September, 1911, is offered in evidence, and marked "Defendants' Exhibit 206".*]

Cross-Int. 93. I show you another slip of January, 1913, and ask you if the signature "L. Bannican" at the bottom of the slip is your signature?

Ans. My signature; yes, sir.

Cross-Int. 94. And this slip indicates the number of pairs of welt shoes that you sewed in January, 1913?

Ans. Yes, sir.

[*Bannican slip for January, 1913, is offered in evidence, and marked "Defendants' Exhibit 207".*]

Cross-Int. 95. I hand you a slip for April, 1913, and ask you if the signature "L. Bannican" is your signature?

Ans. Yes, sir.

Cross-Int. 96. And whether that slip indicates the number of pairs of welt shoes which you sewed in that month?

Ans. It does; yes, sir.

[*Bannican slip for April, 1913, is offered in evidence, and marked "Defendants' Exhibit 208".*]

Cross-Int. 97. I hand you another slip for April, 1912, and ask you if the signature "L. Bannican" is your signature, and whether that slip indicates the number of pairs of welted shoes which you sewed in that month?

Ans. Yes, sir.

[*Bannican slip for April, 1912, is offered in evidence, and marked "Defendants' Exhibit 209".*]

Cross-Int. 98. I show you another slip of August, 1912, and ask you if the signature "L. Bannican" is your signature?

Ans. Yes, sir.

Cross-Int. 99. And that slip indicates the number of pairs of welt shoes that you sewed during the month of August, 1912?

Ans. Yes, sir.

[*Bannican slip for August, 1912, is offered in evidence, and marked "Defendants' Exhibit 210".*]

Mr. PHILLIPS. That is all.

Direct Examination resumed by Mr. WEBSTER.

Int. 100. What kind of shoes do you operate on?

Ans. Men's shoes.

Int. 101. Are they the regular run, or do you work on samples?

Ans. I work on samples altogether when we are running.

Int. 102. Can a man do as much work on sample shoes as on the regular run of shoes?

Ans. I cannot.

Int. 103. What is your age?

Ans. My age is fifty-two last March.

Int. 104. State whether the shoes referred to in the slips which have been introduced in evidence were sample shoes.

Ans. I could not state as to that. Sample shoes and all are put right in together when I figure them up. If I did not have enough samples I took a regular case to fill out my day.

Mr. WEBSTER. Nothing further.

Cross Examination resumed by Mr. PHILLIPS.

Cross-Int. 105. What do you mean by sample shoes?

Ans. The shoes that they send out for samples, and one-pair lots, and I suppose what they call jobbers' samples, eighteen-pair lots and twelve-pair lots, as they come along; also one-pair lots of special shoes, ten days, not sample but special order. That is what I work on.

Mr. PHILLIPS. That is all.

Mr. WEBSTER. This, as at present advised, closes the evidence in rebuttal before the examiner in behalf of the petitioner, with the exception of the introduction of some patents which counsel has not been able to procure up to the present time.

Mr. PHILLIPS. The signature to this deposition is waived. As far as I am at present advised, this closes the defendants' case before the examiner.

[*Signature waived.*]

Attest: CHARLES K. DARLING, *Special Examiner.*

It is stipulated by and between counsel that, if the court assents, the various interrogatories propounded by counsel for the petitioner to the witness Howard before the examiner, and which questions the witness declined to answer under instruction of counsel, may be propounded to the witness at the hearing in open court hereafter, thus avoiding the delay incident to procuring a ruling of the court in the matter and rendering it more convenient for court and counsel.

Hearing closed.

ADDITIONAL EVIDENCE FOR DEFENDANTS.

TAKEN PURSUANT TO ORDER OF COURT, ENTERED FEBRUARY 10, 1914, BEFORE ME,

CHARLES K. DARLING,
Special Examiner.

BOSTON, MASS., February 25, 1914.

Present:

ALLEN WEBSTER, Esq., *Special Assistant to the Attorney General,*
WILLIAM S. GREGG, Esq., *Assistant to the Attorney General, of Counsel for Complainant;*
FREDERICK P. FISH, Esq., and BENJAMIN PHILLIPS, Esq., *of Counsel for Defendants.*

DEPOSITION OF NELSON W. HOWARD (*resumed*).

Mr. WEBSTER. Counsel for the United States gives notice that it reserves its right to insist upon its motion to strike out and suppress; and that the cross-examination of witnesses for the defendants and direct examination of witnesses for the plaintiff will be *de bene esse* and without waiver of objections made or to be made and without waiver of said motion to strike out and suppress. And counsel for the plaintiff gives notice that the plaintiff will especially insist on striking out of testimony with reference to matters and things taken under patents issued after the date of the filing of the bill herein; and to strike out all evidence with reference to machines made in accordance with and as shown in patents issued after the filing of the bill; also as shown in applications which were pending at the filing of the bill. It will also insist upon its motion to remove from the record all patents put in evidence as exhibits by the defendants which were issued after the filing of the bill herein, and also of other exhibits relating to matters taking place after the filing of the bill.

Mr. FISH. Counsel for respondents calls the attention of the

Court to the order of the court entered in the record January 14, 1914.

Cross Examination by ALLEN WEBSTER, Esq., *of Counsel for Complainant.*

Cross-Int. 437. In direct examination you testified at some length with reference to Plant patent for stopping mechanism, dated November 16, 1909, No. 940,052. It is not clear to me whether you intended to testify that the mechanism of the claims of that patent was incorporated in the welt and turn machine and the rapid out-sole stitcher of the United Company. Will you kindly state the fact?

Ans. I do not recall that I have ever referred to patent No. 940,-052 at any point in my testimony.

Cross-Int. 438. In your testimony in chief you, as I recollect it, made reference to the Plant mechanism for stopping the machine. Did you have reference to the Plant mechanism as shown in the patent referred to? Or, in order to shorten the examination, will you kindly state whether as a fact the mechanism of the Plant patent No. 940,052 was incorporated by the United Company in its welters and out-sole stitchers?

Mr. PHILLIPS. Counsel for defendants objects to that as not within the scope of the order.

Ans. That patent No. 940,052 was not the patent which I had in mind in my testimony in regard to the Plant stop motion, and no claims of patent No. 940,052 set forth mechanism which is embodied in the United Company's machines, so far as I am aware.

Cross-Int. 439. In your testimony in chief you have made reference to the Plant patent dated May 17, 1910, No. 958,298, entitled "Sewing Machine", but relating, as I understand it, particularly to a welt-holding, welt-measuring and welt-cutting device. Will you kindly point out on the record what particular claims of that patent define the mechanism which was embodied in the machines of the United Company?

Ans. Claims 1, 2, 3, 4, 5, 6, 7, 13, 15, 16, 17, 19, 21, 27 and 30.

Cross-Int. 440. Will you now kindly state when the mechanisms

defined in the claims referred to by you in your last answer were incorporated in the machines of the United Company? That is to say, whether before or after the Plant acquisition.

Mr. PHILLIPS. Question objected to as not within the scope of the order under which this testimony is to be taken.

Ans. The mechanisms defined in the claims of patent No. 958,-298, May 17, 1910, Plant, were first embodied in commercial machines of the United Company in June, 1911, during which month shoe machine, model K, Goodyear welt and turn, became the standard commercial welting machine of the United Company.

Cross-Int. 441. I observe that the claims referred to by you, or many of them, include "the combination of stopping and starting means". Have you any objection to stating in a general way and briefly what "stopping and starting means" was in fact incorporated in the United machine referred to by you, viz.: "Model K Welter"?

Ans. The starting and stopping machine of the model K welting machine was of the character shown generally in patent No. 1,018,-130, February 20, 1912, Plant, and comprised mechanism for stopping the machine and then reversing it for the purpose of freeing the needle of the machine from the last loop formed by the stitch-forming instrumentalities.

Cross-Int. 442. Do you mean by your last answer to convey the idea that the starting and stopping mechanism incorporated in the United machine contained the spring-acting mechanism as illustrated in Figure 5 of the Plant patent No. 1,018,130?

Ans. No. The specific construction of the mechanism embodied in the model K welter and incorporating the improvement set forth in all four claims of patent 1,018,130 was quite different from the mechanism shown in Figure 5 of that patent.

Cross-Int. 443. For convenience in illustrating the construction of stopping and starting mechanism which is in fact incorporated in the model K United welter, will you kindly state whether there is to your knowledge any patent issued or drawings readily accessible which illustrates such starting and stopping mechanism?

Ans. No patent has as yet been issued which shows in its draw-

ings the exact construction of the starting and stopping mechanism of the model K welter.

Cross-Int. 444. You testified, as I recollect it, that applications for patent for the mechanism referred to in the last question and answer were pending. Have you any objection to producing copies of such applications for inspection and to enable counsel to refer to the drawings for the purpose of illustrating such construction?

Mr. PHILLIPS. Objected to as not within the scope of the order, and as calling for the production of matter which cannot under this order be required.

Ans. I am reluctant to produce and make public drawings of applications pending in the United States Patent Office, but I can do that if necessary. I would like to make a statement on the record, however, to the effect that the model K welting machine has been placed at the disposal of counsel and experts for the United States and that its construction and operation have been fully explained, the explanation being accompanied by taking the machine apart and illustrating in detail the mode of operation of the respective parts.

Mr. WEBSTER. Counsel for the plaintiff admits that the defendants have very courteously afforded counsel for the plaintiff every convenience and facility for the examination of the machine referred to, but in view of the fact that the witness has testified that various machines, including the one referred to, were constructed as shown in the claims, and in some instances in allowed claims, of pending applications for patent, it would seem but fair that counsel for the plaintiff have an opportunity to examine such applications in order to determine whether to proceed with the examination in reference to the claim, or whether to submit evidence to meet the testimony of the witness in reference to such applications; and in order to raise the question at this stage as to all such pending applications, counsel for the plaintiff desires the witness or opposing counsel to state on the record whether such pending applications will be produced for examination by counsel for the plaintiff to enable counsel to proceed with his examination with reference thereto,

and to enable the Court to learn whether the testimony of the witness is in accordance with the facts.

Mr. PHILLIPS. I should like to have you point out the portion of the witness' testimony in which he has testified as to the pendency of any applications for United States Letters Patent involving the mechanism referred to.

Mr. WEBSTER. The question goes generally to pending applications, and counsel for the plaintiff would like very much to learn the attitude of counsel for the defendants with reference to pending applications, thus avoiding spreading upon the record a vast number of interrogatories which seem to be unnecessary.

Mr. PHILLIPS. I recall no such testimony, Mr. Webster. My objection is directed to this specific question. It seems to me that the only proper way to take up the matter is specifically, and not generally.

Mr. WEBSTER. Counsel for the plaintiff states that he is unable at the present moment to refer to the particular portion of the record called for by counsel for the defendants, but will endeavor to ascertain just where it is and call attention of counsel to it at a later stage in this hearing.

Mr. PHILLIPS. In view of the fact that the witness has not testified that there were any pending applications for United States Letters Patent relating to this mechanism, and in view of the fact that a complete disclosure has been made to counsel for the plaintiff of the mechanism involved which has been explained to him by experts and which mechanism is still open for his examination, counsel for the defendants objects to the production of pending applications if there are any relating to said mechanism. Counsel for the plaintiff may have any drawings which he desires prepared from the machine itself, which will be open to his inspection and the inspection of any experts whom he may care to have examine it at any time.

Mr. WEBSTER. Counsel for the plaintiff reserves the right to move to strike out all testimony with reference to pending applications for patents, or machines constructed as shown in pending

applications, on the ground that the defendants decline to submit the machine for inspection on cross-examination.

Mr. PHILLIPS. Counsel for defendants calls attention to the fact that the defendants do not decline to produce pending applications.

Cross-Int. 445. Kindly state whether the model K welt and turn machine as constructed by the United Company contains the mechanism shown in claim 1 of the patent to Plant referred to No. 1,018,130, dated February 20, 1912.

Ans. Yes, sir; it does.

Cross-Int. 446. Then it is a fact, is it, that this machine as constructed contains a member adapted to free the last needle loop from the stitch-forming devices?

Ans. The word "member" does not occur in the claim in question. Adopting the language of that claim, it is a fact that the model K welter embodies "means, acting automatically upon stopping the machine, to free the last needle loop from the stitch forming devices and bring the needle to rest out of engagement with the work".

Cross-Int. 447. Will you kindly define briefly what "means" are employed in the mechanism of the machine in question, model K welter, to free the last needle loop from the stitch-forming devices?

Ans. Generally speaking, the "means" comprises mechanism for stopping the forward movement of the machine at the proper point, and then reversing the machine. That is, running it backward in such manner and in such time relation to the stitch-forming instrumentalities that the needle is freed from the last needle loop formed by the stitch-forming instrumentalities.

Cross-Int. 448. Is it not a fact that in the machine as constructed the retraction of the needle takes place just before the loop would have been formed in the hook of the needle, had the needle continued in its forward motion?

Mr. PHILLIPS. Question objected to as ambiguous.

Ans. No, sir; I should not consider that to be the fact. I will add, however, that what is specifically aimed at in the model K welter, as in the Plant welter, is to free the last loop formed from the needle.

Cross-Int. 449. As a matter of fact, if the machine is stopped just before the loop would be thrown into the hook of the needle had the needle continued its forward movement and the machine is then reversed, the object sought to be obtained by the patent No. 1,018,130 would be accomplished, would it not?

Ans. Yes, sir; because the last loop formed will be freed from the needle if the needle is first moved forward to a point in engagement with the work or any point beyond, provided the forward operations of the machine do not continue to the point where a new loop is taken by the needle, and consequently the needle is then moved back from that point without a new loop. The result of this operation will be the freeing from the stitch-forming instrumentalities of the last loop formed.

Mr. WEBSTER. All that portion of the foregoing answer following the words "Yes, sir", objected to as not responsive, and counsel for plaintiff moves that all that portion of the answer following the words "Yes, sir" be stricken from the record.

Cross-Int. 450. Referring to the paper put in by the defendant and marked "Defendants' Exhibit 342", entitled "United States Patents acquired in the Plant acquisition, the inventions of which have been incorporated in machines of the United Shoe Machinery Company", I note the first patent in the exhibit referred to is No. 944,294, December 28, 1909, Stewart and Hooper. Have you a copy of that patent?

Ans. I have.

Cross-Int. 451. Will you kindly state which one of the claims of said patent defines the mechanism which, as I understand you, you say was incorporated in the machines of the United Shoe Machinery Company?

Ans. All of the twenty-seven claims of that patent.

Cross-Int. 452. Kindly state whether a heel-beading machine for heel seats is a machine such as is known as an auxiliary machine.

Ans. I don't know as I quite understand the question as applied to this machine, but a satisfactory answer may be that this machine is put out by the United Company's general department.

Cross-Int. 453. And it is used for producing an ornamental or beaded edge?

Ans. That is one object, but probably not the principal object, of its use.

Cross-Int. 454. Please state the principal object.

Ans. In addition to forming an ornamental impression on the edge of the out-sole around the heel seat, the machine beads down and rubs waxed blacking into the projecting upper edge of the flesh side of the out-sole in what is known as the Rand crease, thus closing up the open pores of the flesh side of the out-sole, so that it will not so readily absorb moisture. Each of these operations is illustrated in Defendants' Exhibit 110.

Cross-Int. 455. Referring now to finishing and brush cleaning machine, model X, Climax, kindly state what the claims of the patent No. 957,989, May 17, 1910, McLeod, were which were incorporated in the machine of the United Company and when so incorporated.

Ans. All the six claims of patent No. 957,989, May 17, 1910, McLeod, set forth mechanisms embodied in the United Company's finishing and brush cleaning machine, model X, Climax. This machine was adopted in January or February, 1911. I can furnish the exact date if desired.

Cross-Int. 456. Kindly state briefly what the finishing and brush cleaning machine is designed to accomplish.

Ans. This machine is used for polishing by brushing stain or finish applied to the bottom of a shoe. The machine has provision for cleaning the brushes by steam or water.

Cross-Int. 457. And did the finishing and brush cleaning machine of the McLeod patent above referred to take the place of some other machine adapted for a like purpose, or was it entirely new in the art, so far as you are informed?

Ans. It was an improved machine for doing work which had previously been performed by other machines.

Cross-Int. 458. Will you kindly state whether the beading machine of the Stewart and Hooper patent heretofore referred to by

you took the place of some other machine designed to accomplish a like result, or whether it was a distinct improvement in the art?

Ans. I think I can properly answer in the affirmative both questions contained in the last interrogatory.

Cross-Int. 459. Then it did supplant some prior machine adapted for accomplishing a like result; is that right?

Ans. Yes, sir.

Cross-Int. 460. Referring now to your memorandum, grinding machine, model H, Imperial, patent No. 944,238, December 21, 1909, Heys, kindly state what the machine of that patent was used for.

Ans. That machine is used to grind the knives used on the Imperial power heel-breasting machine.

Cross-Int. 461. That is to say, it is a grinding machine for grinding blades; is that right?

Ans. Yes, sir.

Cross-Int. 462. And the novel feature comprised the construction whereby the two opposite edges of the blade could be presented at different angles; is that right?

Mr. PHILLIPS. Objected to as not within the scope of the order of the court under which this testimony is being taken.

Ans. No, sir. The novel improvements embodied in grinding machine, model H, Imperial, were for the purpose of enabling that machine to operate properly upon the transversely-curved knives such as are used in heel-breasting machines, the grinding of which presents peculiar difficulties not ordinarily encountered.

Cross-Int. 463. When did the United Company first put out the grinding machine of the Heys patent No. 944,238, so far as you are informed?

Ans. The machine has embodied the invention of the Heys patent No. 944,238 ever since the date of the Plant acquisition.

Cross-Int. 464. And did that machine take the place of some machine used before that date for accomplishing a like result?

Ans. It is my recollection that before the adoption of that machine it was the practice for the operator to guide by hand, practi-

cally without any aid from the machine, the knife which he was sharpening.

Cross-Int. 465. Grooving and beveling machine, model X, Goodyear welt, patent No. 966,484, August 9, 1910, Stanbon. Kindly state what part of the shoe this machine operated upon.

Ans. This machine operates upon the welt before its attachment to the shoe to prepare it for the attaching operation.

Cross-Int. 466. And does it operate to cut a groove lengthwise of the welt and also to bevel the welt at the same time?

Ans. Yes, sir.

Cross-Int. 467. Did this machine take the place of some machine used before that time to accomplish a like result?

Ans. The machine was an improved machine for performing an operation which had previously been performed by other machines.

Cross-Int. 468. Kindly state whether the machine of the Stanbon patent No. 966,484 was adopted by the United Company and put into use before or after the Plant acquisition.

Ans. After the Plant acquisition.

Cross-Int. 469. If you have the patent before you, will you kindly state whether the mechanism of the grooving and beveling machine put out by the United Company has incorporated in it the mechanism of all the claims of the Stanbon patent referred to?

Mr. PHILLIPS. Question objected to as not within the scope of the order under which testimony is being taken.

Ans. Yes, sir; it does.

Cross-Int. 470. Kindly state whether the grooving and beveling machine of the Stanbon patent referred to as put out commercially is constructed as shown in the Stanbon patent.

Mr. PHILLIPS. Question objected to as not within the scope of the order under which testimony is being taken.

Ans. No, sir; not exactly.

Cross-Int. 471. Referring now to indenting and burnishing machine, model X, Goodyear welt, made as I understand your memoranda under patent to Heys No. 860,377, July 16, 1907, and under an application pending in the name of Heys and McClure,

serial number 631,395, June 5, 1911, will you kindly state whether the patent has yet issued on the application referred to?

Ans. No, sir; it has not.

Cross-Int. 472. Kindly state when the indenting and burnishing machine referred to by you as model X and made under such patent and application went into use or was put out by the United Company.

Ans. It was first put out by the United Company March 31, 1911.

Cross-Int. 473. Did it take the place of some other adapted for accomplishing a like result?

Ans. It is supplied as an alternative machine for performing operations which are performed by other machines.

Cross-Int. 474. State what features of the machine in question are within the terms of the claims of the Heys patent referred to.

Ans. The claims of Heys patent No. 860,377, July 16, 1907, are directed to the general organization of the machine in question, indenting and burnishing machine, model X, Goodyear welt.

Mr. WEBSTER. In view of the fact that counsel for plaintiff has no access to the application referred to by the witness, the statement with reference to said application is objected to and plaintiff moves that it be stricken from the record.

Mr. PHILLIPS. Counsel for defendants calls attention to the fact that complainant's counsel has given no notice that he desired to inspect the pending application referred to or any notice to defendants' counsel to produce it.

Mr. WEBSTER. It is the understanding of counsel for plaintiff that counsel for defendants has refused to produce for inspection any pending applications. Hence the statement made on the record. If counsel for defendants has had a change of heart, he is hereby requested to kindly produce the application referred to in statement by the witness, in Defendants' Exhibit 342, for inspection.

Mr. PHILLIPS. Question objected to because complainant's counsel has given no notice that he desired the application to be produced.

Mr. WEBSTER. Counsel for the plaintiff now gives notice that

he desires to have produced for purposes of inspection and examination, to lay a foundation for interrogatories to be submitted to the witness, the particular application referred to, together with all other pending applications. It is the understanding of counsel for plaintiff that counsel for defendants well knew that these applications would in all probability be called for, and it was not understood that any formal notice was to be required. The same, however, is now given so that there may be no further misapprehension.

Mr. PHILLIPS. With regard to the specific application, inspection of which is requested, counsel for defendants would like to know when it is desired that such application be produced.

Mr. WEBSTER. At the earliest possible moment convenient for the witness and opposing counsel.

Mr. PHILLIPS. Counsel for defendants states that with regard to such application, if it is found to be competent under the order of the Court, it will be produced at the next session. If not, the reason for not producing it will be fully stated. With regard to the general request that all pending applications be produced, it is too vague and indefinite for counsel to take any position in the matter.

Mr. WEBSTER. In the employment of the term "all pending applications", counsel for plaintiff desires it to be understood that he made reference to pending applications testified to by the witness.

Cross-Int. 475. Lasting bench, model X, McLeod application, serial No. 524,952, October 27, 1909. Kindly state if you are willing to produce that application for examination, laying the foundation for submitting cross-interrogatories.

Mr. PHILLIPS. Counsel for defendants has already stated that no notice has been given to produce any pending applications, and for that reason the question is objected to.

Cross-Int. 476. Kindly state whether the lasting bench model X, referred to as made under said application, was adopted by the United Company when it went into use, and what allowed claims of pending applications, if any, covered the construction, and point out what the novel construction comprises.

Mr. PHILLIPS. Question objected to as not within the terms of the order under which this testimony is being taken, and for the

further reason that no notice had been given to produce any pending applications.

Ans. The machine was adopted February 8, 1911, and has been put out since that time. I have not at hand the file of the application or copies of the claims, and shall have to defer answering the balance of the question until I have an opportunity to refresh my recollection by examining the papers of the application.

Cross-Int. 477. Was the lasting bench model X a radically new contrivance, or was it simply an advancement in the art?

Mr. PHILLIPS. Question objected to for the reason that it is not within the scope of the order under which the testimony is being taken.

Ans. I should characterize the machine rather as an improvement upon constructions previously used than as a machine for performing an operation not before performed by machines.

Cross-Int. 478. I observe in your statement, Defendants' Exhibit 342, you refer to this device as a "Lasting Bench", while in your answers now made you refer to it as a machine. Will you kindly state for the information of the Court whether it is a machine or a bench?

Ans. Its name aptly describes it. I used the word "machine" for convenience, or through thoughtlessness.

Cross-Int. 479. Kindly examine the cut on page 45 of Defendants' Exhibit 267, and state whether it properly illustrates the lasting bench model X, made under the application referred to.

Ans. Yes, sir; it does.

Cross-Int. 480. Referring now to your memorandum Defendants' Exhibit 342, under the title "Lasting Machine No. 5, U. S. M. C.", I notice that you appear to say that the No. 5 laster had incorporated in it the mechanisms of patent to Glass No. 957,949, May 17, 1910, reissued No. 13,505, January 7, 1913, and patent to Plant, 958,280, May 17, 1910. Will you kindly state what particular claims of these several patents define the mechanism which I understand you to say was incorporated in the No. 5 laster by the United Company?

Ans. Of reissued patent No. 13,505, January 7, 1913 (original

patent No. 957,949, May 17, 1910), claims 13, 14, 15 and 16 define mechanisms embodied in lasting machine No. 5, U. S. M. Co., and of patent No. 958,280, May 17, 1910, Plant. Claims 46, 47, 49 and 50 define improvements embodied in lasting machine No. 5.

Cross-Int. 481. Can you now very briefly, for the information of the court, point out in a general way what those various mechanisms as referred to in the claims were, so as to avoid necessity of careful analysis of the claims?

Ans. The claims of the Glass patent, reissue No. 13,505, referred to in my preceding answer, are directed to the mechanisms for jacking and unjacking the shoe. The claims of Plant patent No. 958,280 named in my preceding answer are directed to the heel-band operating mechanism of lasting machine No. 5.

Cross-Int. 482. Kindly state when the machine was first put out by the United Company under the head of "No. 5 Laster"?

Ans. January, 1908.

Cross-Int. 483. Kindly state when the heel-band operating mechanism referred to by you as being found in claims 13, 14, 15 and 16 of the reissued patent to Glass No. 13,505, and claims 46, 47, 49 and 50 of the Plant patent No. 958,280 were first, so far as you are informed, incorporated in the No. 5 laster.

Ans. The mechanisms set forth in claims 13 to 16 of Glass reissue No. 13,505 were embodied in the machine when it was first put out in January, 1908, the heel-band operating mechanism defined in claims 46, 47, 49 and 50 of Plant patent 958,280 was first incorporated in the machine in March, 1909.

Cross-Int. 484. Was the No. 5 laster inoperative without having incorporated in it the constructions referred to in your last answer?

Ans. The machine would not be so convenient for the operator, nor would it do so good work without the mechanisms referred to.

Cross-Int. 485. I note you state in Defendants' Exhibit 342, under the head of "Laying Machine, Model X, Apex Welt", that the mechanism defined in the McLeod patent 957,987, May 17, 1910, were incorporated in that machine. Will you kindly state when they were so incorporated by the United Company?

Ans. Laying machine, model X, Apex welt, was a Plant machine which was adopted by the United Company in February, 1911. And the mechanisms set forth in nearly all of the thirteen claims of patent No. 957,987 have been embodied in that machine since that date.

Cross-Int. 486. And was the mechanism of the McLeod patent referred to a radical change and advancement in the art, or was it constructed similar to machines that had previously been used for a like purpose?

Ans. There had been machines previously used for performing the operation which laying machine, model X, Apex welt, is used, but this machine was a distinct improvement upon prior machines, and in its operation did work which was not done by the machines previously used. That is, this machine was organized for severing from the source of supply the welt which had been attached to the shoe. That operation was never before performed by a welt-laying machine.

Cross-Int. 487. Kindly examine the cuts on page 4 of Defendants' Exhibit 267, and state whether or not the one marked "Plant" illustrates the Plant machine made under the McLeod patent, and whether the one on the right marked "Apex Welt Laying Machine — Model A" illustrate the machine previously made by the United Company.

Ans. I answer both questions in this interrogatory in the affirmative.

Cross-Int. 488. Kindly state when the Apex welt-laying machine, model A, was first put out, and when the Plant machine made under the McLeod patent was first put out, so far as you are informed.

Ans. As I previously stated, the laying machine, model X, Apex welt, was adopted in February, 1911. Laying machine, model A, Apex welt, was put out by the United Company in February, 1910.

Cross-Int. 489. And had a machine designed to accomplish a similar purpose been previously put out by the United Company?

Ans. No, sir.

Cross-Int. 490. Had no machine been put out, so far as you know, adapted for laying the welt?

Ans. There had been used for many years a machine for tacking a mock welt to a McKay out-sole; but I do not now recall any machine used before February, 1910, for attaching a mock welt to a McKay out-sole by means of cement, which was the means by which the welt is attached by both laying machine, model A, Apex welt, and laying machine, model X, Apex welt.

Cross-Int. 491. Now, in order to make that matter clear for the court, will you explain when the laying operation took place? Was it after the McKay shoe was stitched or before?

Ans. It was before the stitching operation.

Cross-Int. 492. And the machine operated to cement the welt on the sole, did it?

Ans. Yes, sir.

Cross-Int. 493. I note in Defendants' Exhibit 267, on page 4, the cuts, following the cuts which you have identified, entitled "Fair-stitch Welt Attachment". Do you understand that that has reference to the same machines for laying a mock welt on the edge of a sole of a McKay stitched shoe?

Ans. Yes, sir; the explanation probably being that a McKay welt is almost always "fair-stitched", so that the completed shoe shall resemble in appearance a welt shoe.

Cross-Int. 494. Then am I right in assuming that the laying machine to which reference has been made has no connection whatever with the manufacture of a welt shoe?

Ans. Yes, sir.

Cross-Int. 495. And the apex welt-laying machine which was controlled or manufactured by the United Company prior to the Plant acquisition was adapted to accomplish the same result as the Plant, excepting that the Plant machine cut off the welt at the finishing of the cementing operation; is that right?

Mr. PHILLIPS. Objected to as not within the scope of the order under which this testimony is being taken. The order of the court under which this testimony is being taken reads as follows: —

"With the consent of the parties it is ordered that the United States shall have from February 24 to March 10, inclusive, for the further cross-examination of Nelson W. Howard and the introduction of evidence in rebuttal before the Special Examiner, Charles K. Darling, with reference to matters provided for in the order entered in this cause, on January 14, 1914, and also to introduce evidence before the Special Examiner in rebuttal to evidence submitted by defendants in open court with respect to patents and machines obtained by the defendants from Thomas G. Plant. . . ."

This whole line of cross-examination seems to be directed to the cross-examination of Mr. Howard as to evidence submitted in open court, in connection with Defendants' Exhibit 342, and does not appear that under the order of the court any such cross-examination is authorized. This whole line of examination is therefore objected to.

Ans. I should prefer not to state that the two machines accomplished the same results, as the model X machine was a superior machine throughout. So far as concerns the operations for which the machines were intended, the distinction made in the interrogatory is substantially correct. That is, the model X machine differed from the model A machine in that it cut off the welt at the conclusion of the operation upon each shoe, and that was not done by the model A machine.

Cross-Int. 496. You have referred in your testimony to laying machine, model X, Goodyear channel, made, as I understand your testimony, under patent to Hooper No. 861,179, July 23, 1907, entitled "Channel Flap Layer". Kindly state when, if at all, the machine constructed as set forth in said patent was first put out by the United Company.

Mr. PHILLIPS. Question objected to because it does not relate to any subject-matter referred to by this witness in his testimony before the Special Examiner, and for that reason it is outside the order of the Court under which this testimony is being taken.

Ans. Laying machine, model X, Goodyear channel, constructed as set forth in all of the seventeen claims, excepting claim 13, of patent No. 861,179 was first put out by the United Company on May 5, 1911.

Cross-Int. 497. What machine, if any, had the United Company previously put out for accomplishing the same purpose?

Mr. PHILLIPS. Objected to as outside the order of the Court under which this testimony is being taken.

Ans. A machine known as "laying machine, Goodyear channel".

Cross-Int. 498. Kindly examine the two cuts on page 80 of Plaintiff's Exhibit 267, and state whether the one on the left properly illustrates the Plant machine as put out by the United Company under said patent to Hooper, and whether the one on the right properly illustrates the machine previously put out by the United Company adapted for the same purpose.

Mr. PHILLIPS. Objected to as outside the order of the court and for the reasons already stated.

[*Witness here examines cuts and says:*]

Ans. The two cuts referred to on page 80 of Plaintiff's Exhibit 267 accurately illustrates the two machines referred to in the interrogatory.

Cross-Int. 499. Kindly state whether the laying machine, model X, Goodyear channel, is designed for any purpose other than to turn the channel flap back over the seam after the seam has been laid in the channel.

Mr. PHILLIPS. The same objection.

Ans. The machine was designed to perform that operation, and, so far as I know, for no other operation.

Cross-Int. 500. Is it for use on welt shoes only, or on McKays?

Mr. PHILLIPS. The same objection.

Ans. It was designed particularly for, and is used on, welt shoes.

Cross-Int. 501. You have testified with reference to leveling machine, model B, Hercules, and, as I understand your testimony, it is to the effect that such machine as put out by the United Company was within the terms of some of the claims of patent to Heys No. 684,239, October 8, 1901, and patent to Heys No. 707,414, August 19, 1902. Will you kindly point out which particular claims of those patents include the construction of the machine as

put out by the United Company, and what particular features, stated in your own language, are so covered?

Mr. PHILLIPS. Objected to as relating to nothing touched upon in the prior testimony of this witness before the examiner, and therefore not within the order of the Court authorizing the cross-examination of the witness.

Ans. Leveling machine, model B, Hercules, embodies the mechanism set forth in claims 4, 10 and 13 of patent No. 684,239, Heys, October 8, 1901, and claim 11 of patent No. 707,414, Heys, August 19, 1902.

Cross-Int. 502. Kindly state when the machine was first put out embodying the claims you have referred to in that Heys patent.

[*It is hereby stipulated that the objection heretofore entered on the record by counsel for defendants to this line of examination, because of its being outside the scope of the order, may be hereafter covered in the record by the words "Same objection", without having the objection spread at length upon the record.*]

Ans. In June, 1905.

Cross-Int. 503. That relates to both patents?

Ans. Yes, sir.

Cross-Int. 504. Can you, without inconvenience, state where one of the machines which had incorporated in it the construction set forth in the claims of the two patents referred to and put out in 1905 or 1906 may be found for examination?

Mr. PHILLIPS. Same objection.

Ans. I shall be glad to provide a machine at my office for your inspection.

Cross-Int. 505. Pardon me, but I desire to ascertain the whereabouts of such machine which was put out and put into actual use in 1905 or 1906, and if you can give the information it will very much oblige.

Mr. PHILLIPS. The same objection.

Ans. I cannot state at this time where one of these machines is in operation, but at the next session I shall be glad to submit a list of factories where those machines may be seen in operation.

Cross-Int. 506. Were you not knowing to the fact in 1905 when

the leveling machine, model B, Hercules, was put out by the United Company that it was an infringement upon the Heys patent referred to?

Mr. PHILLIPS. Same objection.

Ans. I was aware of that fact at that time, or soon after that time.

Cross-Int. 507. Did the United Company continue, after acquiring such knowledge, to put out such machine in infringement of those patents?

Mr. PHILLIPS. Same objection.

Ans. Yes, sir.

Cross-Int. 508. Are you not knowing to the fact that counsel advised the United Company that the machine so put out did not infringe the patents referred to?

Mr. PHILLIPS. The same objection, and further objected to because it relates to advice of counsel, which is privileged and cannot be inquired into.

Ans. I am not.

Cross-Int. 509. You have testified with reference to loading and attaching machine, model B, McKay automatic heel, and, as I understand your testimony, such machines as put out by the United Company fell within the terms of the claims of patent to Plant No. 958,281, dated May 17, 1910, and patent to Plant No. 958,282, dated May 17, 1910. Will you kindly state when the loading and attaching machine, model B, McKay automatic heel, was first put out by the United Company containing the constructions set forth in the claims of such patents, or either of them, and point out which particular claims define such construction?

Mr. PHILLIPS. Same objection.

Ans. The loaning and attaching machine, model B, McKay automatic heel, was first put out in November, 1910, after a year or more of experimental factory use. It embodied the improvements set forth in claim 8 of patent No. 958,281, May 17, 1910, Plant, and claims 10 and 11 of patent No. 958,282, May 17, 1910, Plant.

Cross-Int. 510. What machine had the United Company put out

to accomplish the same purpose prior to putting out loading and attaching machine, model B, McKay automatic heel?

Mr. PHILLIPS. Same objection.

Ans. For the attaching of the heels of welt shoes, which was the class of work for which loading and attaching machine, model B, was designed, the United Company had been putting out nailing machine, American Lightning.

Cross-Int. 511. Stated in other words, a loading and attaching machine, as I understand it, is a machine for attaching the heel to the sole of the shoe; am I right?

Mr. PHILLIPS. Same objection.

Ans. Yes, sir.

Cross-Int. 512. And for the information of the Court and counsel, will you kindly state what the designation "loading" means in connection with the rest of the title adopted by your company?

Ans. In loading and attaching machine, model B, McKay, automatic heel, the heel-attaching nails are automatically taken from a mass of nails in a hopper and the proper number of nails for the heel to be attached are arranged with their points all in the same direction; are automatically delivered to a nail transferer, and are deposited by that transferer in the nail block from which they are driven to attach the heel. The word "loading" in the name of the machine has reference to this automatic supplying of the proper number of nails for each operation of the machine.

Cross-Int. 513. There is some evidence on the record in your deposition relating to molding machine, stitch-down upper; kindly state briefly for what character of shoe such a machine is adapted for operation.

Mr. PHILLIPS. The same objection.

Ans. That machine is adapted particularly for the making of stitch-down shoes.

Cross-Int. 514. In other words, will you kindly explain to the Court what kind of a shoe a shoe is which has a stitch-down upper; that is, whether it is a welt shoe, a McKay shoe, or what kind of a shoe?

Mr. PHILLIPS. The same objection.

Ans. In making a stitch-down shoe, during the lasting operation the edge of the upper, instead of being laid over the bottom of the insole or over the feather edge of the insole as in a McKay sewed or welt shoe respectively, is out-turned away from the corner of the last formed by its side and its bottom, and the out-sole is secured to the shoe by stitching passing through the out-turned flange of the upper and the out-sole.

Cross-Int. 515. Do you know whether there is any considerable amount of stitch-down upper shoes made and sold?

Mr. PHILLIPS. Same objection.

Ans. Yes, sir; a large number of stitch-down shoes are being manufactured all the time.

Cross-Int. 516. Are they heavy or light shoes?

Mr. PHILLIPS. Same objection.

Ans. Probably the greater proportion of them are children's shoes, but a considerable number of sandals for both men and women are made in this way, and the proportion of men's and women's shoes made by this method is rapidly increasing.

Cross-Int. 517. I observe that the patents referred to in your list Defendants' Exhibit 342, under the head of "Molding Machine, Stitch-down Upper", are entitled, No. 871,963, November 26, 1907, Stewart, "Machine for making Pad Covers", and that the other patent referred to, namely, No. 871,966, November, 26, 1906, Stewart, is entitled "Method for making Pad Covers". Do the titles quoted from the patents correctly designate the subject-matter of the patents referred to?

Mr. PHILLIPS. Same objection.

Ans. Yes, sir; in that patent No. 871,963 shows and describes a machine primarily intended for making pad covers, and patent No. 871,966 sets forth a method which is described in that patent as practiced in the making of pad covers.

Cross-Int. 518. Did the United Company ever carry out the method of making pad covers defined in patent No. 871,966?

Mr. PHILLIPS. Same objection.

Ans. Its machine known as "Molding Machine, Stitch-down

Upper" practices in its operations the method set forth in claims 1, 2 and 4 of that patent No. 871,966.

Cross-Int. 519. Did the United Company ever carry out the method?

Mr. PHILLIPS. Same objection.

Ans. Yes, sir; to the extent that it builds and supplies to manufacturers machines which can be operated only by practicing the method set forth in the claims named in my last answer.

Cross-Int. 520. Kindly state when the United Company first put out its machines like that set forth in the patent for machine for making pad covers.

Mr. PHILLIPS. Same objection.

Ans. In November, 1907, the United Company first put out a machine embodying mechanism set forth in claims 4, 7, 28 and 37 of patent No. 871,963.

Cross-Int. 521. And had the United Company, prior to November, 1907, put out any machine adapted for accomplishing a like result?

Mr. PHILLIPS. Same objection.

Ans. For a few months before that date the United Company had put out separate machines for molding the toe and the heel of a stitch-down shoe. Molding machine, stitch-down upper, was, in effect, a combination of the two earlier machines and comprises in one machine mechanism for molding both the toe and the heel of a stitch-down shoe.

Cross-Int. 522. And did the United Company continue from November, 1907, to put out molding machine, stitch-down upper, in infringement of the Stewart patents referred to until the purchase of patents from Plant?

Mr. PHILLIPS. Same objection.

Ans. Yes, sir.

Cross-Int. 523. In your testimony you make reference to the Plant patents No. 958,302, May 17, 1910, and No. 958,282, May 17, 1910, the constructions set out in some of the claims of which patents were incorporated, as I understand you, in the United Com-

pany's nailing machine, American Lightning. Will you kindly state when such construction was first embodied in such machine?

Mr. PHILLIPS. Same objection.

Ans. Mechanism embodying improvements defined in the claims of patent No. 958,302, May 17, 1910, Plant, was first used on the nailing machine, American Lightning, in January, 1910, but as it was found to infringe that patent it was discontinued until after the Plant acquisition. On September 29, 1910, after the Plant acquisition, under instructions from the patent department, the mechanism was adopted and a large number of machines have since been put out embodying this mechanism. Mechanism embodying the subject-matter of claims of patent No. 958,282, May 17, 1910, Plant, is incorporated in the reorganized automatic machine which was adopted in July, 1913, after many months of experimental use.

Cross-Int. 524. In order to shorten the record as much as possible, I will ask you to kindly examine the heel having nails driven therein, which heel was kindly delivered to me yesterday by yourself or Mr. Warren, and state whether it properly illustrates the kind of work the machine in question, having the mechanism of the Plant patent referred to incorporated therein, is adapted to perform.

Mr. PHILLIPS. The same objection.

Ans. The heel which you have submitted for my inspection is a "loaded heel" which was loaded on the machine illustrated in patent No. 958,302, May 17, 1910, Plant. The nailing machine, American Lightning, does not use a loaded heel. This heel, however, does illustrate roughly the driving of heel-attaching nails at an inclination, which is done by the Lightning machine.

Cross-Int. 525. The alleged Plant improvement, as I understand it, related to the mechanism by which the nails were fed at an angle to the tread surface of the heel; am I right?

Mr. PHILLIPS. Same objection.

Ans. The improvements defined in the claims of Plant patent No. 958,302, the mechanisms of which are incorporated in the nailing machine, American Lightning, have to do with the driving of heel-attaching nails in directions inclined rearwardly.

Cross-Int. 526. Is it not a fact that nails were previously driven, inclined rearwardly through the heel, prior to the disclosure of the mechanisms set forth in said Plant patents?

Mr. PHILLIPS. Same objection.

Ans. Yes, sir; the mechanism which we have been discussing constituted an improvement upon nailing machine, American Lightning, as it had previously been organized for driving nails inclined rearwardly.

Cross-Int. 527. You have testified with reference to opening machine, model X, Goodyear channel. If the construction of that machine is illustrated in Plaintiff's Exhibit 267, will you kindly point out upon what page such illustration appears?

Mr. PHILLIPS. Same objection.

Ans. That machine is illustrated on page 73 of Plaintiff's Exhibit 267, in the cut at the left.

Cross-Int. 528. Kindly state when the opening machine referred to by you, constructed as set forth in the patent to Hooper No. 947,509, January 25, 1910, was first put out by the United Company.

Mr. PHILLIPS. Same objection.

Ans. In May, 1911.

Cross-Int. 529. I observe that the patent referred to by you under the heading of opening machine is entitled "Channel Lip Turning Machine". Do I understand the two terms mean the same?

Mr. PHILLIPS. Same objection.

Ans. Yes, sir.

Cross-Int. 530. Had any machine been put out by the United Company, previous to the Plant acquisition, designed and adapted to accomplish the same purpose?

Mr. PHILLIPS. The same objection.

Ans. Yes, sir.

[*Adjourned to 10* A. M., *February 26, 1914.*]

BOSTON, MASS., February 26, 1914.

Mr. WEBSTER. The witness having kindly produced the copy of patent to Bertrand of March 7, 1882, containing an illustration of what is known as a stitch-down shoe, counsel for the plaintiff offers in evidence a drawing marked "Fig. 3" of the patent in question.

Mr. PHILLIPS. The introduction of the exhibit is objected to as outside the order of the Court under which this testimony is being taken.

[*Drawing marked "Fig. 3" of Bertrand patent No. 254,594 is marked "Plaintiff's Exhibit 280".*]

Cross-Int. 531. Will you kindly examine the shoe I now hand you, and state whether it is a welt shoe for men?

Ans. The shoe submitted for my inspection appears to be a man's welt shoe.

[*Man's welt shoe examined by the witness is offered in evidence, and marked "Plaintiff's Exhibit 281".*]

Cross-Int. 532. Will you kindly examine the shoe I now hand you, and state whether it is a welt shoe for women?

Ans. The last shoe submitted for my inspection appears to be a woman's welt shoe, unusually heavy and of large size.

[*Woman's welt shoe examined by the witness is offered in evidence, and marked "Plaintiff's Exhibit 282".*]

Cross-Int. 533. Will you kindly examine the cuts on page 108 of Plaintiff's Exhibit 267, and state whether either of the cuts properly illustrate the knife grinding about which you testified yesterday?

Mr. PHILLIPS. Question objected to as outside the order of the court under which this testimony is being taken, there being no authority in said order to cross-examine this witness on any subject-matter not referred to in his testimony previously given in behalf of the defendants before this examiner. It is agreed that an objection noted as "The same objection" shall be equivalent to a repetition of this objection.

Ans. No, sir. Neither of the cuts on page 108 of Plaintiff's Exhibit 267 illustrates the grinding machine, model H, Imperial, about which I testified yesterday.

Cross-Int. 534. Will you kindly give the trade designation, as employed by the United Company, of the cut at the right of page 108 if the same is a machine put out by the United Company?

Mr. PHILLIPS. Same objection.

Ans. The United Company did not adopt the Plant machine shown in the cut at the right of page 108 of this exhibit, and has not put that machine out.

Cross-Int. 535. Do either of the machines illustrated in the cuts on page 108 of Plaintiff's Exhibit 267 show a construction such as is defined in the claims of the patent purchased of Plant, to which you made reference yesterday, Heys No. 944,238, December 21, 1909?

Mr. PHILLIPS. Same objection.

Ans. No; the machine of Heys patent No. 944,238 is intended and adapted for entirely different uses from those for which the machines on page 108 of the Exhibit 267 are adapted.

Cross-Int. 536. If the grinding machine of the Heys patent is illustrated in Plaintiff's Exhibit 267, will you kindly state upon what page it is found?

Mr. PHILLIPS. Same objection.

Ans. I believe that the machine of Heys patent No. 944,238 is not illustrated in Plaintiff's Exhibit 267.

Cross-Int. 537. You testified with reference to polishing machine, model X, Climax, and as I understand it your testimony is to the effect that such machine was constructed by the United Company in accordance with some of the claims of the patent to Plant No. 958,288, dated May 17, 1910, and patent to Plant No. 965,223, dated July 26, 1910. Will you kindly state when a machine was first put out by the United Company constructed as set forth in said claims?

Mr. PHILLIPS. Same objection.

Ans. That machine, polishing machine, model X, Climax, was adopted in February, 1911.

Cross-Int. 538. And had the United Company previously put out a machine adapted for accomplishing the same purpose?

Mr. PHILLIPS. Same objection.

Ans. Yes, sir.

Cross-Int. 539. I note that patent No. 965,223 is entitled "Dust Gatherer for Abrading Machine"; will you state briefly whether that patent relates to anything more than is indicated in the title of the patent, to-wit, a dust gatherer?

Mr. PHILLIPS. Same objection.

Ans. Perhaps I ought to explain that the "dust" in this title means the material which is removed from the stock in the operation of the machine. In the operation of such a machine the air about the machine is constantly filled with this fine material removed in the operation of the machine, unless means is provided for removing it. With this explanation I should state that the title properly designates the improvement as set forth in this patent.

Cross-Int. 540. I note that the other patent, to-wit, patent No. 958,288, dated May 17, 1910, is entitled "Boot and Shoe Buffing Machine"; am I to understand that the terms "polishing machine" and "buffing machine" are used as synonymous terms in this connection?

Mr. PHILLIPS. Same objection.

Ans. I do not understand the question.

Cross-Int. 541. I note that in the title employed by you in the paper marked "Defendants' Exhibit 342" you make reference to "Polishing Machine, Model X, Climax", to refer to the patents noted in the previous question and answers. I note also that in one of these patents the title is stated as "Boot and Shoe Buffing Machine". My question is whether the term "polishing machine" as employed by you in Defendants' Exhibit 342 is a synonymous term with "buffing machine" as employed in the patent?

Mr. PHILLIPS. Same objection.

Ans. No, sir.

Cross-Int. 542. Then am I to understand that the buffing machine of the Plant patent No. 958,288 is not a polishing machine?

Mr. PHILLIPS. Same objection.

Ans. Not as the terms "buffing machine" and "polishing machine" are technically used in the industry. It should of course be understood that improvements which are useful in a buffing ma-

chine may also be useful in a polishing machine, and that is the situation in this case.

Cross-Int. 543. Did it involve any change in the construction of the machine to employ the mechanism of the buffing machine of the Plant patent referred to, to turn it into a polishing machine such as is referred to in the exhibit?

Mr. PHILLIPS. Same objection.

Ans. Yes, sir; it involved some mechanical changes, such as altering dimensions of parts.

Cross-Int. 544. Will you kindly examine Figure 2 of patent to Plant, entitled "Boot and Shoe Buffing Machine", No. 958,288, and state whether it properly illustrates the invention sought to be protected by the claims of that patent?

Mr. PHILLIPS. Same objection.

Ans. Yes, sir; it does.

Cross-Int. 545. Do you know whether the record contains an illustration of the polishing machine, model X, Climax, as put out by the United Company?

Mr. PHILLIPS. Same objection.

Ans. Yes, sir; that machine is illustrated in the cut at the left on page 134 of Plaintiff's Exhibit 267.

Cross-Int. 546. You have testified with reference to pulling-over machine, model B, Rex, and I understand your testimony is to the effect that such machine as put out by the United Company was constructed as set forth in some of the claims of patent to Heys No. 957,955, dated May 17, 1910, and while you have heretofore stated on the record what claims were embodied in such machine, I will ask you to kindly state the same now and also state when that machine was first put out by the United Company constructed as set forth in such claims.

Mr. PHILLIPS. Same objection.

Ans. Pulling-over machine, model B, Rex, was adopted in July, 1910. The improvement defined in claim 55 of patent No. 957,955, May 17, 1910, Heys, was adopted on September 30, 1910, after the acquisition of the Plant patents.

Cross-Int. 547. You have testified with reference to rounding

machine, Goodyear heel seat, and as I understand your testimony such machine was put out by the United Company constructed as set forth in patent to Heys No. 1,005,545, October 10, 1911, and patent to Phelan No. 1,005,573, October 10, 1911. Will you kindly state when such machine was first put out by the United Company containing structures defined in the claims of such patents, and what claims define such structures?

Mr. PHILLIPS. Same objection.

Ans. This machine, rounding machine, Goodyear heel seat, in its first form was put out by the United Company in September, 1906. In view of British patent No. 12,613, May 31, 1907 (priority claimed June 1, 1906), granted to M. D. Phelan, whom we knew to be one of Plant's inventors, we discontinued the first type of the machine, as we assumed that a United States application corresponding to that British patent was pending. Such an application was pending and on it was granted patent No. 1,005,573, October 10, 1911. If the first form of our machine had been continued, it would have infringed that patent. In the endeavor to avoid this infringement the machine was reorganized and was again adopted commercially in August, 1909. The new construction avoided infringement of the Phelan patent, but further difficulty was encountered when, on February 1, 1910, an interference, No. 31,422, was declared between an application on this second form of machine owned by the United Company and an application, serial No. 309,997, filed April 5, 1906, Heys, on which was granted patent No. 1,005,545, October 10, 1911. When this interference was declared we learned for the first time that Plant's inventor, Heys, was prior to Phelan. The issues of that interference were claims 8, 15, 17, 18 and 21 of patent No. 1,005,545, October 10, 1911, Heys. If we had continued to put out this second form of the machine, it would have infringed those claims and also claims 1, 2 and 6 of that patent. Accordingly we discontinued the machine and did not put it out again until after the acquisition of the Plant patent. It was then again adopted and put into extensive commercial use.

Cross-Int. 548. The machine of these patents comprises as one

of its principal novel features a curved flexible knife which moves to cut the surplus stock from the out-sole at the heel portion of the shoe, does it not?

Mr. PHILLIPS. Same objection.

Ans. The machine comprises such a knife, but that is not one of the principal novel features defined in the claims of the Heys and Phelan patents.

Cross-Int. 549. Referring again for a moment to pulling-over machine, model B, Rex, I note that claim 55 to which you have made reference cites, among other things, "a gaging device movable into and out of operative position". Kindly state whether this gaging device is illustrated in Fig. 1 of the patent and point out the marking as indicating such device.

Mr. PHILLIPS. Same objection.

Ans. Yes, sir: the gaging device, which is an element of claim 55 of patent 957,955, is illustrated in Fig. 1 of that patent. The part of the device which engages the shoe is marked "110".

Cross-Int. 550. And this device comprises a pin or rod marked "109", bent downwardly as indicated by 110 and mounted to be moved as desired upon a support, does it not?

Mr. PHILLIPS. Same objection.

Ans. As I have stated, the part of the device which engages the shoe is marked "110" in Fig. 1 of patent No. 957,955. If it be attempted to identify the other elements of claim 55, it will be necessary to name many more parts than are mentioned in the interrogatory.

Cross-Int. 551. Very well. The part 110 is integral of the part 109, is it not?

Mr. PHILLIPS. Same objection.

Ans. No, sir; it is not.

Cross-Int. 552. Is it a separate member mounted upon the end of the part marked "109"?

Mr. PHILLIPS. Same objection.

Ans. Yes, sir.

Cross-Int. 553. But the part marked "109" is the rod upon which part 110 is mounted, is it not?—

Mr. PHILLIPS. Same objection.

Ans. Yes, sir.

Cross-Int. 554. You have testified with reference to rounding and channeling machine, model E, Goodyear Universal, and as I understand your testimony such machine as put out by the United company at one time was constructed as set forth in some of the claims of patent to English No. 878,478, February 4, 1908. Will you kindly state when such machine was first put out constructed as set forth in the claims heretofore referred to, to-wit, 51, 52, 53 and 54 of said patent?

Mr. PHILLIPS. Same objection.

Ans. The machine inquired about, rounding and channeling machine, Goodyear Universal, model E, was first put out by the United Company in December, 1910. The machine as then constructed embodied the improvements set forth in claims 51, 52, 53 and 54 of patent No. 878,478, February 4, 1908, English. Every machine which has been put out has embodied improvements set forth in those claims 51 to 54. The machine as originally designed before it was put out for commercial use also embodied the improvements set forth in claims 18, 20 and 21 of this patent No. 878,478, February 4, 1908, English, but with great difficulty and at much expense the machine was changed to avoid this infringement before it was put into commercial use.

Cross-Int. 555. What was the trade-name or designation of the rounding and channeling machine put out by the United Company previous to such machine which embodied the construction referred to in the four claims 51, 52, 53 and 54?

Mr. PHILLIPS. Same objection.

Ans. Rounding and channeling machine, Goodyear Universal.

Cross-Int. 556. Is it not a fact that in claims 51 to 54, inclusive, a variable speed mechanism is one of the essential elements?

Mr. PHILLIPS. Same objection.

Ans. Claim 51 includes as an element "a variable speed-driving mechanism for the pattern", and an element defined in more or less similar terms is in each of claims 52, 53 and 54.

Cross-Int. 557. In other words, this variable speed mechanism

is a contrivance in which, by the moving of a lever, a high or low speed of the pattern may be attained; is that right?

Mr. PHILLIPS. Same objection, and further objected to as ambiguous and uncertain.

Ans. I prefer to explain the mechanism as I have heretofore explained it in my testimony in regard to this machine. The improvement comprised mechanism never before used in such a machine for controlling the operation of the pattern cam in such manner that the position of the forepart guide which determines the distance of the rounding cut from the edge of the last would be right at any given point in the operation of the machine whatever the size of the shoe.

Cross-Int. 558. That result is attained by changing the speed of the pattern, is it not?

Mr. PHILLIPS. Same objection.

Ans. Roughly speaking, that is correct.

Cross-Int. 559. You have testified with reference to scouring machine, model X, heel, and as I understand you the same was constructed as shown in patent to Bohr No. 883,445, March 31, 1908, and as shown in patent to McLeod No. 957,993, May 17, 1910. Will you kindly state when such machine was first put out by the United Company constructed as shown in said patents and referred to in the claims thereof?

Mr. PHILLIPS. Same objection.

Ans. Scouring machine, Model X, heel, was first put out by the United Company in November, 1911. Its commercial form is shown in the cut at the left, marked "Plant", on page 109 of Plaintiff's Exhibit 267.

Cross-Int. 560. Kindly state what machine was put out by the United Company prior to November, 1911, designed and adapted to accomplish the same purpose as the Plant device.

Mr. PHILLIPS. Same objection.

Ans. The heel-scouring machine which was put out by the United Company in November, 1911, is illustrated in the cut at the right, entitled "Heel Scouring Machine", on page 109 of Plaintiff's Exhibit 267.

Cross-Int. 561. You have testified with reference to splitting machine, Rapid noiseless wonder, which I understand you to say was constructed as shown in patent to Heys No. 844,128; kindly state when such machine was put out so constructed by the United Company.

Mr. PHILLIPS. Same objection.

Ans. This machine was first put out in September, 1910.

Cross-Int. 562. What was the trade designation of the machine before that time put out by the United Company designed for accomplishing a like result?

Mr. PHILLIPS. Same objection.

Ans. The United Company was putting out a machine known as the "Summit Splitting Machine".

Cross-Int. 563. State if you know whether there is in the record an illustration of the splitting machine, Rapid noiseless wonder.

Mr. PHILLIPS. Same objection.

Ans. I don't recall that there is.

Cross-Int. 564. Would it be convenient to produce one?

Ans. Yes, sir; I think I can produce one.

Cross-Int. 565. Will you kindly do so and very much oblige?

Ans. I shall be glad to.

Cross-Int. 566. You have testified with reference to treeing machine, model H, Miller twin, constructed, as I understand your testimony, in accordance with the patent to Hooper No. 944,365, December 28, 1909. Will you kindly state when such machine was first put out by the United Company and what claims of said patent show such construction, and the trade designation of the machine before the time designed to accomplish a like result, put out by the United Company?

Mr. PHILLIPS. Same objection.

Ans. Treeing machine, model H, Miller twin, had been put out for some years prior to the Plant acquisition by the O. A. Miller Treeing Machine Company, a constituent company of the United Shoe Machinery Company. In 1911 this machine was improved

by incorporating in it improvements set forth in the claims of patent No. 944,365, December 28, 1909, Hooper.

Cross-Int. 567. To state it in a homely way, a treeing machine is an apparatus to be inserted in a shoe and stretch the upper to the desired shape, is it not?

Ans. No, sir.

Cross-Int. 568. What is it designed for?

Ans. A treeing machine is intended and adapted for supporting and presenting properly a shoe for the operation of cleaning and finishing the upper at practically the end of the many making operations on the shoe.

Cross-Int. 569. I observe that the patent to Hooper referred to, No. 944,365, is entitled "Boot and Shoe Tree and Stretcher". Is that designation a correct designation for that patent in question?

Mr. PHILLIPS. Same objection.

Ans. Yes; this patent discloses and sets forth in its claims improvements on the portion of the treeing machine indicated in its title.

Cross-Int. 570. You have testified with reference to wetting machine, model X, Crest sole, and as I understand you the same was constructed by the United Company at one time as shown in patent to McLeod No. 957,992. Will you kindly examine that patent, and state whether Fig. 1 of the drawing properly illustrates the construction of such device or machine as put out by the United Company?

Mr. PHILLIPS. Same objection.

Ans. Fig. 1 of the drawings of the McLeod patent No. 957,992, which is a sectional view, shows with substantial accuracy the construction of the United Company's commercial wetting machine, model X, Crest sole, except that in the commercial machine a change has been made in the support indicated at "8" in that drawing, so that that support is now adjustable.

Cross-Int. 571. Kindly state when the United Company first put out a machine constructed as shown in said McLeod patent, and the trade designation as employed by the United Company of the machine or apparatus used before that time for the same purpose.

Mr. PHILLIPS. Same objection.

Ans. Wetting machine, model X, Crest sole, was adopted in February, 1911. The name of the machine previously put out by the United Company was wetting machine, Crest sole.

Cross-Int. 572. You have testified with reference to wetting machine, model X, Economy insole, constructed by the United Company, as I understand you, in accordance with patent to Hooper No. 957,961, May 17, 1910. Will you kindly state when the United Company first put out a machine constructed as shown in said patent, and the trade designation of machine prior to that time put out by the United Company for accomplishing the same result?

Mr. PHILLIPS. Same objection.

Ans. Wetting machine, model X, Economy insole, was adopted by the United Company in February, 1911. The machine previously put out is shown at the right on page 31 of Plaintiff's Exhibit 267, and I believe the official designation of that machine was "Wetting Machine, Economy Insole".

Cross-Int. 573. And does the cut at the left on page 31 of Plaintiff's Exhibit 267 properly illustrate the construction of the machine as put out by the United Company after February, 1911?

Ans. Yes, sir.

Mr. PHILLIPS. Counsel for defendants desires to repeat his objection to this whole line of cross-examination relating to Defendants' Exhibit 342, or to any evidence taken in open court in regard to the same, on the ground that such cross-examination is outside the order of the court under which this testimony is being taken, because such order does not authorize cross-examination of this witness except as to certain matters testified to by him in his testimony heretofore given in behalf of the defendants before this examiner.

Mr. WEBSTER. Counsel for the plaintiff respectfully calls attention to the fact that while in his opinion cross-examination with reference to matters referred to in the Defendants' Exhibit 342 is entirely within the scope of the order, the fact remains, nevertheless, that while that exhibit has been referred to for convenience, the record of the proceedings before the Special Examiner clearly

shows that the witness testified in direct examination with reference to the same devices, machines and patents, and therefore, even within the field conceded by counsel for the defendants, the cross-examination is entirely proper.

[*By subsequent agreement of counsel, hearing to be resumed at 10* A. M., *February 27, 1914.*]

BOSTON, MASS., February 27, 1914.

Mr. WEBSTER. Counsel for the plaintiff inquires of counsel for the defendants whether he is prepared to produce copies of the pending applications for United States patents called for yesterday.

Mr. PHILLIPS. Counsel for defendants states that the cross-examination of Mr. Howard, during which pending applications were called for, was entirely outside of the order of the Court, but that without waving that objection, or without admitting the right of the complainant to call for the production of any applications pending in the United States Patent Office, and saving all defendants' rights in the premises, he is ready to produce the applications identified by counsel for complainant and requested to be produced, and he herewith produces such applications and submits them to counsel for the plaintiff.

The WITNESS. At the session on February 25, 1914, I was requested to produce copies of applications Serial No. 631,395, June 5, 1911, Heys and McClure, and serial No. 524,952, October 27, 1909, McLeod. I now produce for the inspection of counsel for the United States copies of the specifications, claims and drawings, as filed, of each of these applications.

Cross-Int. 574. Will you also produce copies of amendments and Office actions?

Mr. PHILLIPS. Counsel for defendants objects to the foregoing interrogatory and request as outside the order of the Court under which this testimony is being taken, for the reason hereinbefore fully stated and for the further reason that no reference has been made by this witness in any of his testimony to the Office actions upon any pending application; that such actions have no materiality in this cause; that the inventions sought to be patented in the

2836

applications produced are clearly disclosed in the drawings and described in the specifications, and the discussions between the examiner and solicitor prosecuting such applications and any question arising during that prosecution can be of no materiality. The original applications are, of course, all on file in the United States Patent Office and cannot be produced.

Cross-Int. 575. Is there any paper among the papers produced by you, alleging to be copies of pending applications, indicating officially when either or any of said applications were filed, whether they have been acted upon, and what claims, if any, stand allowed?

Mr. PHILLIPS. Objected to for the reasons hereinbefore fully stated.

Ans. As to the first question in the interrogatory, in order that the request of counsel for the United States might be met promptly it was impracticable to obtain certified copies of these applications from the United States Patent Office. Accordingly the copies were made from the file copies of the solicitors in the respective applications.

As to the second and third questions in the interrogatory, the copies submitted are, as I have previously stated, copies of the respective specifications, claims and drawings as originally filed which contain full disclosures of the improvements sought to be patented, but which do not show such subsequent proceedings as have been had in the Patent Office.

Mr. PHILLIPS. With regard to proceedings in the Patent Office, the defendants' counsel desires to add that, in accordance with the well known procedure in the Office, the statements of any examiner in charge of an application for a patent are made as then advised on the art and are no indication of the patentability of any claim referred to, and in practice are frequently altered and reversed; that an application for a patent, even after notice of so-called final allowance, is frequently withdrawn from issue and refused to the applicant on account of interference or for other reasons. For that reason the discussions of the attorney and the examiner can be of no materiality in any issue in this cause.

Mr. WEBSTER. Are we then to understand from the statement

of counsel for defendants that none of the claims of the pending applications to which the witness has testified are in fact allowed?

Mr. PHILLIPS. I am not aware that any claim of a patent is declared to include a patentable subject-matter until the grant of the patent. As my Brother Webster well knows, the refusal of the examiner to admit the patentability of a claim is often reversed by the Board of Examiners-in-Chief, and the Board of Examiners-in-Chief reversed by the Commissioner, and the Commissioner reversed by the Court of Appeals.

Mr. WEBSTER. It is the understanding of counsel for complainant that the statement made by learned counsel for the defendants is correct, and that none of the claims of a pending application may properly be said to be allowed until such time as the application as a whole is allowed and parties finally notified of that fact. The call for the copies of the applications which the witness has testified to was made because of the fact that the witness has frequently referred to "allowed claims" of pending applications, and now in view of the statement of counsel for defendants that no such claims were in fact allowed, counsel for complainant will not ask to examine the applications, but will insist upon the motion to strike out and erase from the record all testimony heretofore entered tending to show that claims of such pending applications were in fact allowed.

Counsel for complainant desires further to state that he did not call upon defendants to produce certified copies of any such applications, but did expect such copies to be presented as in fact formed a part of the application, thus including amendments and letters from the Patent Office; and counsel desires to say that he will be perfectly content with any paper which the witness states is a copy of any paper forwarded to the Patent Office. In view, however, of the statements heretofore made, it now becomes entirely unnecessary to go further with reference to pending applications.

Mr. PHILLIPS. Counsel for defendants calls the attention of the Court to the fact that the copies of the applications submitted to counsel for the plaintiff contain a complete disclosure of the invention for which it was expected to obtain United States Letters Pat-

ent, and that from such disclosure the learned counsel for the Government and his experienced expert can determine what that invention is with as great ease and facility as they could if the invention had actually gone to patent and the patent were presented to them. The statements of plaintiff's counsel as to Office actions and their utility in determining the novelty or patentability of an invention are frivolous.

Mr. WEBSTER. We are well aware that it is common practice among enthusiastic applicants for patents to claim everything possible relating to the art forming the subject-matter of such application, and if we were to rely upon such applications it would be apparent that the defendants might justify under applications covering every conceivable form of mechanism.

Mr. PHILLIPS. The only question of any materiality in this matter being as to whether or not these applications contained patentable subject-matter, that fact can be fully determined on the complete disclosure contained in the copies submitted to counsel for the plaintiff.

Cross-Int. 576. In the printed record on page 2286 you testify with reference to three patents issued after the filing of the bill herein, the same relating to fudge-stitch mechanisms, incorporated in out-sole rapid lockstitch machine. Kindly state whether the mechanisms defined in the claims of such patents are incorporated in the out-sole rapid lockstitch machine of the United Company, and when first so incorporated, and which claims define the mechanisms so incorporated.

Ans. Discussing first the second patent of the group of three to which the interrogatory relates, fudge-stitch mechanisms constructed substantially as shown in patent No. 1,017,397, February 13, 1912, Fletcher and MacLean (application filed March 31, 1905), were first embodied in the rapid out-sole lockstitch machine early in 1905 and this form has been furnished on that machine when desired ever since. That mechanism embodies the improvements set forth in claims 1 to 7 inclusive, 9, 13, 14 and 15 of that patent No. 1,017,397.

Early in 1906 there was adopted the form of fudge-stitch mechan-

ism shown specifically in patent No. 1,017,380, February 13, 1912, Cady and Thayer (application filed October 11, 1907). That form of the mechanism has been the most generally used and has been supplied on the machine ever since its introduction, which, as I have already stated, was early in 1906. That form, known as type A, embodies the improvements set forth in all five of the claims of patent No. 1,017,380.

Another form of fudge-stitch mechanism which has been preferred by some manufacturers is constructed substantially, but not exactly, as shown in the third patent of the group inquired about, namely, No. 1,027,791, May 28, 1912, Allen (original application filed February 8, 1906). This form is known as type B and embodies mechanisms set forth in all of the five claims of this patent No. 1,027,791. The improvements set forth in broad terms of this patent No. 1,027,791 are embodied in all forms of fudge-stitch mechanisms which have been incorporated in the different models of the out-sole lockstitch machine since the fudge-stitch mechanism was first embodied in that machine early in 1905.

Cross-Int. 577. Then, as I understand you, the improvements of said several patents issued after the filing of the bill herein were incorporated in the model M out-sole rapid lockstitch machine; is that correct?

Ans. The form of fudge-stitch mechanism which has always been embodied in the model M rapid out-sole lockstitch machine since it was first put out embodies mechanisms set forth in patent No. 1,017,397, February 13, 1912, Fletcher and MacLean (application filed March 31, 1905), and patent No. 1,027,791, May 28, 1912), Allen (original application filed February 8, 1906). That mechanism on the model M machine also embodies improvements defined in the claims of a number of other patents, but it does not embody the improvements defined in patent No. 1,017,380, February 13, 1912, Cady and Thayer.

While discussing the model M stitcher, I should like to correct my statement in the sixth line on page 2301 of the printed record. I stated there that this machine "was first put out for commercial use as recently as January, 1912". Since making that statement

I have learned that on January 6, 1912, the first leases were executed for eight of these machines, but that two machines had previously been put into commercial use in shoe factories. The first of these was put out in June, 1911, and was continuously used in shoe factories until June 24, 1912. The second machine put out for commercial use was first used in a shoe factory on August 14, 1911, and has been in continuous use in shoe factories from that date to the present time.

Mr. WEBSTER. All the last portion of the answer is objected to as non-responsive. Counsel is, however, quite content that it remain as part of the record by way of correction, as I understand it was intended.

Cross-Int. 578. The subject-matter of these patents, stated in a homely way, is, as I understand it, a provision by which a channel may be cut in the welt in advance of the stitching operation; am I correct?

Ans. Roughly speaking, that is correct, it of course being understood that the channel or groove is automatically formed by the out-sole stitcher itself immediately preceding the formation of the stitch which is to be received in the groove so cut.

Cross-Int. 579. And is it not a fact to your knowledge that the same operation had been performed prior to the applications for said patents?

Mr. PHILLIPS. Objected to as outside the scope of the order.

Ans. Yes, sir; I understand a few fudge-stitch mechanisms constructed specifically as shown in patent No. 1,017,397, February 13, 1912, Fletcher and McLean, were used for a few months prior to the filing of the application for that patent.

Cross-Int. 580. On page 2293 of the printed record you make reference to patent to Hadaway dated June 25, 1912, relating, as I understand, to mechanism by which the presser-foot in an out-sole rapid lockstitch machine operates to force together the layers of stock before the formation of the stitch. Kindly state when, so far as you are advised, such mechanism was first incorporated in the lockstitch machine of the United Company.

Ans. The improvements defined in the claims of patent No.

1,030,582, June 25, 1912, Hadaway (application filed September 29, 1904), were first embodied in a commercial machine supplied by the United Shoe Machinery Company on May 21, 1910. Those improvements were incorporated in lockstitch machine, Goodyear out-sole rapid, model K, which, on that date, became the standard commercial out-sole stitching machine of the United Company. The improvements defined in the claims of that patent were also embodied in lockstitch machine, Goodyear out-sole rapid, model M, which, as appears from my corrected testimony in regard to that machine, was first put out for commercial use in June, 1911.

Cross-Int. 581. In your testimony with reference to out-sole rapid lockstitch machine, model M, you make reference, so far as the printed record is concerned, to the same having been first put out after the filing of the bill. You now, as I understand you, correct that testimony and say that it was first put out prior to the filing of the bill. In view, however, of the printed record, I would like permission to ask of you a general, concise statement of the organization of the model M out-sole stitcher in so far as the stopping mechanism is concerned. I am led to submit this interrogatory because the printed record clearly shows your testimony to the effect that it was put out after the filing of the bill, and although I have no objection to the correction I would like you to describe the stopping mechanism as actually embodied in the model M machine.

Mr. PHILLIPS. Objected to as outside the scope of the order.

Ans. The mechanism for stopping lockstitch machine, Goodyear out-sole rapid, model M, comprises means which, at whatever speed the machine is running at the time the operator wishes to stop it, first reduces the speed of the machine to a predetermined low speed, and then from that predetermined low speed stops the machine always at the same predetermined point in the cycle of its operation.

Cross-Int. 582. You have now stated the result of the operation of the mechanism. I would like to have spread on the record a brief statement or word picture of the mechanism. I desire this especially because I understand from your testimony no patent has

yet been issued which clearly shows such mechanism. I therefore ask you if it is not a fact that the mechanism employed by the United Company, crudely stated perhaps, comprises a shaft having a clutch, which shaft revolves backwardly or in a direction opposite to the forward motion of the shaft of the machine; that when it is desired to stop the machine a brake mechanism operates to check the forward motion of the main shaft of the machine; the clutch then revolving in an opposite direction is brought into engagement with a clutch on the main shaft and such clutch causes the reverse motion of the main shaft to a predetermined point.

Mr. PHILLIPS. Objected to as outside the order of the court.

Ans. No, sir; that is not a correct description of the operation of the stopping mechanism of the model M stitcher.

Cross-Int. 583. Will you kindly spread upon the record a brief description of the stopping mechanism as embodied in the model M machine, but which you say is not shown in any patent yet issued?

Mr. PHILLIPS. The same objection.

Ans. Lockstitch machine, Goodyear out-sole rapid, model M, comprises two mechanisms for operating the driving shaft of the machine. One of these, which may conveniently be termed the "high-speed driving mechanism", operates the driving shaft at the various speeds desired during the operation of the machine, varying from the highest speed on the straight and easy portions of the work, to the somewhat lower speeds generally desired on the more difficult portions of the work, as in the shank. The other driving mechanism may be conveniently termed the "low-speed driving mechanism". When the operator wishes to stop the machine he renders inoperative the high-speed driving mechanism and at the same time renders operative the low-speed driving mechanism. This low-speed driving mechanism first operates to reduce the speed of the machine to a predetermined low speed, and then it operates to drive the machine at that predetermined low speed until the point in the cyle of the machine's operations is reached at which the machine should stop. At that point the machine is automatically stopped, obviously with much less jar and less wear on the machine than would be the case if the machine were stopped

while running at its normal high speed. It is also obvious that by this construction the stopping will always take place at the proper predetermined point in the cycle of the machine's operation, which would probably be impossible if it were attempted to stop the machine while running at any of the varying high speeds at which the machine is normally operated.

Cross-Int. 584. Were the model M machines which you say were put out in 1911 constructed like the model M machine which you kindly showed to me in the building at the corner of Beach and Lincoln Streets very recently?

Mr. PHILLIPS. The same objection.

Ans. The model M stitcher as first put out in 1911 was constructed substantially as it is now constructed, and was substantially the same in respect to the mechanism described in my preceding answer as the machine which was exhibited to you in the Albany Building at the corner of Beach and Lincoln Streets.

Cross-Int. 585. And is the stopping mechanism of the model K welter the same as the stopping mechanism of the model M stitcher?

Mr. PHILLIPS. The same objection.

Ans. The stopping mechanism of the model K welter, officially known as "Shoe Machine — Model K: Goodyear Welt and Turn", embodies mechanisms substantially similar to those incorporated in the lockstitch machine, model M, Goodyear out-sole rapid, but in the model K welter the slow-speed driving mechanism runs in the opposite direction from the direction in which the high-speed driving mechanism operates.

Cross-Int. 586. Is any clutch mechanism employed in the stopping mechanism of either of these machines?

Mr. PHILLIPS. The same objection.

Ans. Yes, sir.

Cross-Int. 587. And is it employed in both?

Mr. PHILLIPS. The same objection.

Ans. Yes, sir.

Cross-Int. 588. And are the high and low-speed shafts driven independently of each other?

Ans. I don't quite understand the question.

Cross-Int. 589. Is an independent belt or driving mechanism employed to drive the low-speed shaft in both machines, or in either?

Ans. There is a separate belt for operating the slow-speed driving mechanism in each machine, if that is what is meant by the question.

Cross-Int. 590. And does the slow-speed shaft revolve continually?

Ans. The slow-speed driving mechanism is being continuously driven by its belt during the normal operation of the machine.

Cross-Int. 591. And the slow-speed mechanism in the welter revolves in a direction opposite to that of the stitcher; is that correct?

Ans. In the model K welter the slow-speed driving mechanism revolves in an opposite direction to that in which the driving shaft of the machine operates; while in the model M stitcher the slow-speed driving mechanism and the high-speed driving mechanism run in the same direction.

Cross-Int. 592. And in both machines is the stopping point predetermined?

Ans. Yes, sir.

Cross-Int. 593. In the model M stitcher is there any reverse movement after the slow-speed driving mechanism is put into operation?

Ans. No, sir.

Cross-Int. 594. And the clutch mechanism referred to in your previous answers is a friction clutch mechanism, is it not?

Ans. The slow-speed driving mechanism in the model M stitcher is so organized and constructed that it may serve, first, to reduce the speed of the machine to a predetermined low speed, and may then drive the machine at that predetermined low speed. It is perhaps proper to designate it roughly as a friction clutch mechanism.

The WITNESS. Referring to the correction which I have previously made in the sixth line of page 2301 of the printed record, I should like, if I may be permitted, to have the same correction

apply in any other instance where I stated that lockstitch machine, Goodyear out-sole rapid, model M, was first put out in January, 1912. The date of June 7, 1911, should be substituted in each such instance.

Cross-Int. 595. On page 2299 of the printed record, in referring to the presser-foot organization of the model M stitcher, you say: "This improved presser-foot organization . . . is not yet shown in a granted patent", and one of the features is set forth in broad terms in patent to Richardson. Can you briefly point out the construction referred to by you in that phraseology which differs from the one feature which you say is set forth in broad terms in the Richardson patent?

Ans. In the model M stitcher the presser-foot is automatically raised when the machine stops, so that the operator can remove the shoe upon which the machine has been operating and substitute another shoe for the operation of the machine without the necessity of twice lifting the presser-foot by hand. When the machine starts in its operation upon a new shoe the presser-foot is automatically lowered into pressing engagement with the work. It should, of course, be understood that there are other important differences in the organization and operation of the presser-foot mechanism on the model M machine, but I understand the one to which I have specifically referred is that to which the interrogatory had reference.

Cross-Int. 596. Am I to understand that you mean by your last answer that the mechanism by which the operation is performed, which you described, is not defined in the Richardson patent?

Ans. No, sir; I did not mean that, because the mechanism which I described embodies the improvement defined in claim 16 of the Richardson patent No. 710,613, October 7, 1902.

Cross-Int. 597. Please explain the difference between the mechanism not covered by patent and the mechanism defined in the Richardson patent as embodied in the model M stitcher.

Ans. Claim 16 of the Richardson patent No. 710,613 does not set forth mechanism for automatically lifting the presser-foot when

the machine stops, nor for automatically lowering the presser-foot into engagement with the work when the machine starts.

Cross-Int. 598. I note on page 2316 of the printed record you make reference to two patents issued after the filing of the bill, and in connection with the same I understand you to say that the model E rounding and channeling machine superseded the 1899 machine, but you do not state when the model E machine superseded the 1899 machine. Will you kindly state?

Ans. Rounding and channeling machine, Goodyear Universal, model E, was first shipped December 8, 1910, and since that date has been the standard commercial rounding and channeling machine furnished to shoe manufacturers by the United Shoe Machinery Company.

Cross-Int. 599. On page 2326 of the printed record you make reference to a patent to Bertrand issued after the filing of the bill, to wit, April 23, 1912, in connection with channeling machine, Goodyear Universal (welt work). Kindly state when such machine containing the mechanism of the Bertrand patent was first put out by the United Company.

Ans. Channeling machine, Goodyear Universal (welt work) was first put out by the United Company September 28, 1907, and the machine at that time and ever since embodied the mechanism set forth in claims of patent No. 1,023,801, April 23, 1912, Bertrand (application filed April 30, 1908).

Cross-Int. 600. For the convenience of Court and counsel, will you kindly state whether the several channeling machines referred to by you in the printed record, beginning on page 2318 and ending on page 2330, are illustrated in any exhibit or exhibits now in the record in this case? I refer particularly to illustrations other than in patents.

Ans. The Goodyear Universal insole channeling machine as it was put out prior to February, 1899, by the Goodyear Shoe Machinery Company, and for a time after that date by the United Shoe Machinery Company, is illustrated in Plaintiff's Exhibit No. 235. The insole channeling machine which was superseded by that machine is illustrated on page 95 of Plaintiff's Exhibit No.

220, which is the Goodyear Shoe Machinery Company's catalogue of January 1, 1897. I do not recall that channeling machine, Goodyear Universal (welt work), or channeling machine, Goodyear Universal (turn work), are illustrated in any exhibits other than certain of the patents which form a part of Defendants' Exhibit 119.

Cross-Int. 601. Would it be convenient for you, for the convenience of Court and counsel, to furnish cuts or illustrations of such channeling machines referred to in your previous answer as do not appear to be illustrated in any of the exhibits other than patents now in the record?

Ans. Yes, sir; I shall be glad to produce such illustrations.

Cross-Int. 602. In the printed record, beginning with page 2339 and ending with page 2345, you testify at some length concerning stitch-separating machines. Will you kindly state whether you understand such designation to indicate the class of machines known as "auxiliary machines"?

Mr. PHILLIPS. Objected to as outside the order of the court.

Ans. No, sir; that expression does not indicate the class of machines known as "auxiliary machines", but the stitch-separating machine put out by the United Shoe Machinery Company is an auxiliary machine of defendants' Goodyear department.

Cross-Int. 693. That is to say, it is a separate and distinct machine designed for stitch separation only; am I correct?

Mr. PHILLIPS. Same objection.

Ans. Yes, sir.

Cross-Int. 604. Will you state whether the stitch-separating machines to which you have made reference in your testimony are shown in any illustrations now in the record other than in patents?

Mr. PHILLIPS. Same objection.

Ans. The first type of commercial machine for separating stitches which was first put out by the Goodyear Shoe Machinery Company in September, 1895, and which is referred to on page 2340 of the record, is illustrated in the cut on page 89 of Plaintiff's Exhibit 220, Goodyear Shoe Machinery Company's catalogue of 1897. There is no illustration of later types of that machine, or of the

present commercial machine now in the record otherwise than in patents, so far as I recollect.

Cross-Int. 605. Would it be convenient for you to produce cuts or illustrations of the several stitch-separating machines with reference to which you have testified, other than the one which you say is already illustrated in one of the catalogues?

Mr. PHILLIPS. Same objection.

Ans. I think I can produce an illustration of the present commercial stitch-separating machine, and will endeavor to find and produce illustrations of the machine in different stages of its development since 1895.

Mr. WEBSTER. Kindly note that I do not ask for illustrations of anything other than machines with reference to which you have testified.

Cross-Int. 606. I note on page 2372 of the printed record you make reference to the Keyes patent issued February 18, 1913. Will you kindly state when, if at all, the mechanisms of the claims of the Keyes patent of 1913 were incorporated in the lasting machine to which you refer?

Ans. The improvements set forth in all of the six claims of patent No. 1,053,612, February 18, 1913, Keyes (application filed December 26, 1908), were incorporated in the Chase lasting machine in December, 1907, and all Chase lasting machines shipped since that date, and I believe all which were then out in shoe factories, have had these improvements embodied in them.

Cross-Int. 607. I do not find in the record a statement made by you as to the mechanisms of this Keyes patent of 1913. Can you conveniently briefly state the subject-matter of the claims?

Ans. It is the universal practice during the lasting operation to secure the lasted upper of welt shoes around the toe by means of wire instead of by means of tacks, as was the practice prior to 1898. The improvements of patent No. 1,053,612 relate to mechanism for supplying such wire for use on lasting machines of the bed type.

Cross-Int. 608. Is it not a fact that the alleged invention of the

Keyes patent of February 18, 1913, No. 1,053,612, relates to reels rather than lasters?

Ans. It is a fact that the patent No. 1,053,612 relates to reels particularly designed for use on lasting machines.

Cross-Int. 609. I observe on page 2377 of the printed record you make reference to patent to Brock, dated February 27, 1912, and as I understand your testimony you say that the mechanism of the claims of such patent were incorporated in the No. 5 lasting machine. Will you kindly state briefly just what the alleged improvements were?

Ans. Improvements set forth in one hundred and ten of the one hundred and sixteen claims of patent No. 1,018,477, February 27, 1912, Brock (application filed October 26, 1907), were incorporated in the No. 5 lasting machine as it was first put out for commercial use in January, 1908, and have ever since been embodied in that machine. These improvements have to do with nearly every part of the machine, but perhaps the most important improvements are those which adapted that machine for the first time in the industry to last satisfactorily shoes made upon modern crooked lasts, such as are shown in Defendants' Exhibit 137. The organization of the machine which enabled it to last shoes on crooked lasts satisfactorily was discussed by me on pages 2376 and 2377 of the printed record, and was also explained by me on pages 4276 to 4278 of the typewritten record [printed pages 4941–4943]. I shall be glad to make further explanations of the advantages of these improvements and of the many others which are set forth in the claims of patent No. 1,018,477, if desired.

Cross-Int. 610. I observe on page 2424 of the printed record, in commenting upon heel-compressing machines, you say: —

"The nail-arranging mechanism was constructed substantially as shown in patent No. 577,211, February 16, 1897, Small, and six of the seven claims of that patent define mechanism embodied in the nail-handling organization of that machine. That mechanism was also defined more broadly in the claims of patent No. 577,212, February 16, 1897, Small."

Will you kindly state whether the record is in error, and, if so, how it should be corrected?

Ans. Yes, that is an error. The number of the patent first mentioned in the quotation should be No. 577,213. The date is correct as it stands.

Cross-Int. 611. I note you say on page 2425: "The McKay Shoe Machinery Company just prior to February, 1899, did not have a satisfactory heel-compressing machine." Do you mean by that statement that the machine that that company had was abandoned and that a new construction was adopted by the United Company?

Mr. PHILLIPS. Objected to as outside the order of the court under which this testimony is taken.

Ans. Yes, sir; an entirely new machine was produced by the United Company.

Cross-Int. 612. Kindly state if a heel-compressing machine is properly designated as an auxiliary machine.

Mr. PHILLIPS. The same objection.

Ans. No, sir; I should not so designate it.

Cross-Int. 613. Is it not, to your knowledge, so designated in the leases of the United Company?

Mr. PHILLIPS. The same objection.

Ans. I do not recall; my duties do not require familiarity with the leases of the United Company.

Cross-Int. 614. Would you say that a machine for compressing top-lifts was an auxiliary machine?

Mr. PHILLIPS. The same objection.

Ans. I should not so regard it.

Cross-Int. 615. Would you say that a nailing machine was an auxiliary machine or a principal machine?

Mr. PHILLIPS. The same objection.

Ans. I should not regard a nailing machine as an auxiliary machine.

Cross-Int. 616. Would you regard it as a principal machine?

Ans. It is certainly a very important machine.

Cross-Int. 617. But you cannot state whether it is a principal machine or not?

Mr. PHILLIPS. The same objection, and further objected to because the witness is not called upon to define abstract terms.

Ans. I don't know that I understand what is meant by the term "principal machine", but I have no hesitation in stating that nailing machines are among the important machines supplied by the United Company.

Cross-Int. 618. And do you say you don't know whether it is designated by that company as one of its principal machines, or not?

Mr. PHILLIPS. The same objection, and further objected to because the witness is not called upon to hazard a guess as to the meaning of such terms, if employed by others.

Ans. I do not recall that in the heeling and metallic departments, through which nailing machines are put out, there is any division of the machines which would justify me in attaching more importance to one than to others.

Cross-Int. 619. Am I to understand from your last answer that from your standpoint each machine put out by the United Company is fully as important as every other machine?

Mr. PHILLIPS. Objected to as outside the order of the court.

Ans. No, sir.

Cross-Int. 620. Is there any line of demarcation between the most important and the less important machines, in your mind?

Mr. PHILLIPS. Objected to as outside the order of the court, and entirely immaterial and incompetent.

Ans. Some of the machines are doubtles more important than others.

Cross-Int. 621. Is there any objection to stating what machines you consider the most important?

Mr. PHILLIPS. Objected to as outside the order of the court under which this testimony is being taken, and immaterial and incompetent.

Ans. I could probably express my views in response to this interrogatory if desired, but should need some time to prepare such an answer as I would be willing to make.

Cross-Int. 622. Will you be good enough to prepare such an answer and submit it at the next session?

Mr. PHILLIPS. Objected to as outside the order of the court under which this testimony is being taken.

Ans. No, sir; because it would require more time than I could devote to it before the next session.

Cross-Int. 623. I notice on page 2467 of the printed record you refer to patent to Casgrain, dated February 13, 1912, in connection with which you say that claim 7 defines improvements embodied in Universal slugging machine. Kindly state when the invention defined in the seventh claim referred to was first embodied in the slugging machine.

Ans. The improvement defined in claim 7 of patent No. 1,017,381, February 13, 1912 (application filed October 24, 1898), was embodied in machines first put out by the United Company in February, 1899, and has been incorporated in all machines put out since that date.

Cross-Int. 624. I note, beginning with page 2473 of the printed record you discuss heel-breasting machines. Will you kindly state briefly whether it is not a fact that a heel-breasting machine is a machine for cutting the face of the heel from the top-lift to the shank, that is, cutting off the surplus stock?

Ans. Yes, sir; a heel-breasting machine is used for removing the surplus stock on the front or breast face of the heel, from the top-lift to the shank of the sole.

Cross-Int. 625. And appliances for accomplishing this result have been in use for twenty-five years, have they not?

Mr. PHILLIPS. Objected to as outside the order of the court under which this testimony is being taken.

Mr. WEBSTER. The attention of counsel is respectfully called to the fact that heel-breasting machines are clearly within the order of the court because they are especially referred to in the motion to strike out.

Ans. Yes, sir.

Cross-Int. 626. And it has been universal, has it not, to accomplish the result by a moving blade or knife traveling down across the breast of the heel?

Mr. PHILLIPS. The same objection.

Ans. No, sir.

Cross-Int. 627. How, then, has it been done?

Ans. In some of the crude foot-power machines, such as were universally used before the introduction of the power machine by the United Shoe Machinery Company, the heel breast was trimmed by moving the shoe into engagement with a stationary knife.

Cross-Int. 628. Then the broad difference between the old type and the new type was that in one the shoe was moved, while in the other the blade moved; is that correct?

Mr. PHILLIPS. Same objection.

Ans. That is not at all correct.

Cross-Int. 629. Does it make any difference in the result of the operation whether the blade moves or the shoe moves?

Mr. PHILLIPS. Same objection.

Ans. The old foot-power machines were of two types. In one type the blade was moved and in the other type the shoe was moved. Manufacturers found one type or the other better suited for certain classes of work. In the power heel-breasting machine now known as "Heel Breasting Machine, Model B: Imperial", the knife moves with relation to the shoe, but that is not a very necessary incident of the very important improvements which characterize that machine.

Cross-Int. 630. The old type of machine was used for a great many years, was it not?

Mr. PHILLIPS. Same objection.

Ans. Yes, sir; the old types were used for many years.

Cross-Int. 631. On page 2493 you refer to channeling machine, Economy insole. Kindly state whether the channeling machine for an insole differs materially from a channeling machine for any other kind of a sole, and point out the difference.

Ans. Channeling machine, Economy insole, is a machine designed particularly and used for preparing the blank for reinforcement by canvas to produce the improved insole known as "Economy" insole. The United Company also supplies to manufacturers another machine known as "Channeling Machine, Goodyear Insole (welt work)", which is designed particularly for, and used for, channeling "all leather" insoles.

Both of these machines operate upon the insole before the insole

becomes a part of the shoe. Neither of them is adapted, nor can either of them be used, for channeling out-soles. It is a general practice to channel and round the out-sole after it has been temporarily attached to the shoe by cement, the machine for this purpose being known as a rounding and channeling machine. In short, the differences between insole and out-sole channeling machines are radical and fundamental.

Cross-Int. 632. Both are channels cut in the sole, aren't they?

Mr. PHILLIPS. Same objection.

Ans. I do not understand what is meant by the word "both" in the interrogatory.

Cross-Int. 633. The channel in an insole is cut in the sole, is it not?

Ans. An insole channeling machine forms two channels on the flesh side of an insole.

Cross-Int. 634. And how many channels does an out-sole channeling machine form?

Ans. The United Company does not put out any machine which may be characterized as an out-sole channeling machine. The rounding and channeling machine supplied by the United Company trims or rough-rounds the out-sole and simultaneously forms a single channel on the grain side of the sole to receive and conceal the outseam.

Cross-Int. 635. Is it not a fact known to you that an out-sole channeling machine was used by some one of the companies that went to make up the United Company after the United Company's organization?

Mr. PHILLIPS. Objected to as entirely outside the order of the court under which this testimony is being taken, and further as being incompetent, immaterial and irrelevant to any issue in this court.

Ans. A machine known as Goodyear out-sole channeling machine was supplied to manufacturers by the Goodyear Shoe Machinery Company prior to the invention and introduction to the trade of rounding and channeling machines, but that machine was obsolete

before the United Shoe Machinery Company was formed in February, 1899.

Mr. WEBSTER. All that portion of the answer beginning with the words "but that machine was obsolete" are objected to as non-responsive, and motion is made to strike the same from the record.

Cross-Int. 636. Through inadvertence yesterday I neglected to have the loaded heel to which you made reference marked as an exhibit. Will you now state to the examiner whether the heel I now hand you is the one you referred to yesterday?

Ans. Yes, sir; it is.

[*Loaded heel is introduced in evidence, and marked "Plaintiff's Exhibit 283".*]

Cross-Int. 637. Kindly examine the strip of welting I now hand you, and state whether it is a fair sample of the welting produced on one of the welt grooving and beveling machines, as testified to by you.

Ans. The piece of welting shown me was grooved, beveled and slashed on the Plant welt slasher and groover, shown on page 82 of the Plant catalogue Plaintiff's Exhibit 266.

[*Strip of welting grooved, beveled and slashed on Plant welt slasher and groover is marked "Plaintiff's Exhibit 284".*]

Cross-Int. 638. Did the United Company put out a machine for manufacturing such welting strips prior to the acquisition of the Plant outfit?

Mr. PHILLIPS. Objected to as outside the order of the court under which this testimony is being taken.

Ans. The United Company put out a machine which grooved and beveled the welt, but did not slash it, prior to the acquisition of the Plant patents.

Cross-Int. 639. Is it common for shoe manufacturers to use strips of welting grooved, beveled and slashed?

Mr. PHILLIPS. Objected to as outside the order of the court.

Ans. The usual practice is to use welting which has been grooved and beveled, and then, after the welt has been attached to the shoe, to slash it around the toe, but not elsewhere, during the welt-beating operation. The two operations of beating out the welt and

slashing it around the toe are performed as one operation on the United Company's machine "Beating and Slashing Machine — Goodyear Welt".

[*Adjourned to 10* A. M., *Monday, March 2, 1914.*]

BOSTON, MASS., March 3, 1914.

Cross-Int. 640. On page 2473 of the printed record you testify with reference to heel breasting machine, model B, Imperial. Kindly examine the illustration I now hand you, and state whether it properly illustrates that machine.

Ans. The cut entitled "Imperial Heel Breasting Machine — Model B", illustrates the United Company's machine known as "Heel Breasting Machine — Model B: Imperial".

Cross-Int. 641. Will you kindly examine the illustration marked "Imperial Heel Breasting Machine — Model B", and mark thereon with the word "knife" connecting same with the cutting blade of that machine?

Ans. I have, as requested, indicated the knife on the cut of the machine in question, by writing the word "knife" at one side of the cut and running a lead line therefrom to the illustration of the knife in the machine.

Cross-Int. 642. On page 2485 of the printed record you testify with reference to "Turning and Slashing Machine, Goodyear Lip". Kindly examine the illustration I now hand you, and state whether it is a correct illustration of that machine.

Ans. Yes, sir; the cut inquired about, entitled "Turning and Slashing Machine, Goodyear Lip", correctly illustrates that machine.

Cross-Int. 643. The machine termed "Turning and Slashing Machine, Goodyear Lip", is a machine employed in connection with the Gem insole, is it not?

Ans. The machine is used in the preparation of the leather blank for reinforcement by canvas to produce the Gem insole, but it is also used upon all leather insoles, which is the use for which it was primarily designed.

Cross-Int. 644. Have you before you an illustration of the Gem insole; and, if so, will you kindly produce it?

Mr. PHILLIPS. Objected to as outside the order of the court.

Ans. I have no illustration of the Gem insole, but samples of Gem insoles constitute Defendants' Exhibits No. 17 and 167.

Cross-Int. 645. On page 2493 you testify with reference to "Channeling Machine, Economy Insole". If you have an illustration of that machine, will you kindly produce it?

Ans. As requested, I produce an illustration of that machine entitled "Economy Insole Channeling Machine".

Cross-Int. 646. On page 2496 you testify with reference to "Beating Machine, Goodyear Universal Welt". If you have an illustration of that machine before you, will you kindly produce it?

Ans. I produce an illustration of that machine entitled "Goodyear Universal Welt Beating Machine".

Cross-Int. 647. On page 2497 of the printed record you testify with reference to "Beating and Slashing Machine, Goodyear Welt". If you have before you an illustration of that machine will you kindly produce it?

Ans. I produce an illustration of that machine entitled "Goodyear Welt Beating and Slashing Machine".

Cross-Int. 648. On page 2512 of the printed record you testify with reference to "Skiving Machine, Goodyear Universal Shank". If you have an illustration of that machine before you, will you kindly produce it?

Ans. I produce an illustration of that machine entitled "Goodyear Universal Shank Skiving Machine".

Cross-Int. 649. On page 2512 of the printed record you testify with reference to "Skiving Machine, Goodyear Shank Welt". If you have before you an Illustration of that machine, will you kindly produce it?

Ans. I produce an illustration of that machine entitled "Goodyear Shank Skiving Machine".

Cross-Int. 650. On page 2514 of the printed record you testify with reference to "Reducing Machine, Goodyear Outsole Channel Shank". If you have an illustration of that machine before you, will you kindly produce it?

Ans. I produce an illustration of that machine entitled "Goodyear Outsole Channel Shank Reducing Machine".

Cross-Int. 651. On page 2517 of the printed record you testify with reference to "Indenting and Burnishing Machine, Goodyear Welt". If you have an illustration of that machine before you, will you kindly produce it?

Ans. I produce an illustration of that machine entitled "Goodyear Welt Indenting and Burnishing Machine".

Cross-Int. 652. On page 2519 of the printed record you testify with reference to "Burnishing Machine No. 2: Goodyear Impression Stitch". If you have an illustration of that machine before you, will you kindly produce it?

Ans. I produce an illustration of that machine entitled "Goodyear Impression Stitch Burnishing Machine, No. 2".

Cross-Int. 653. On page 2522 of the printed record you testify with reference to "Trimming Machine — Model A: Rex Upper". If you have an illustration of that machine before you, will you kindly produce it?

Ans. I produce an illustration of that machine entitled "Rex Upper Trimming Machine — Model A".

Cross-Int. 654. On page 2523 of the printed record you testify with reference to "Trimming Machine — Model H: Rex Upper". If you have an illustration of that machine before you, will you kindly produce it?

Ans. I produce an illustration of that machine entitled "Rex Upper Trimming Machine — Model H".

Cross-Int. 655. Somewhere in the record you make reference to "Assembling Spindle, Rex". Kindly state whether that machine is now in use, and if it was ever abandoned state as nearly as possible when.

Mr. PHILLIPS. Objected to as outside the order of the court.

Ans. The machine inquired about, "Assembling Spindle, Rex", was superseded in September, 1905, by "Assembling Machine: Rex", and "Assembling Spindle, Rex" has been obsolete since 1905.

Cross-Int. 656. Have you before you an illustration of that spindle or machine?

Ans. I have not been able as yet to secure an illustration of

"Assembling Spindle, Rex", although I may be able to get such an illustration in the course of a day.

Cross-Int. 657. On page 2554 you testify with reference to "Assembling Machine: Rex". If you have an illustration of that machine before you, will you kindly produce it?

Ans. The cut which I now produce, entitled "Rex Assembling Machine", is an illustration of that machine.

Cross-Int. 658. On page 2560 you testify with reference to "Pounding Machine: Rex", and "Pounding Machine — Model E, Rex". If you have illustrations of those machines before you, will you kindly produce them?

Ans. I produce an illustration entitled "Rex Pounding Machine —Model E". This machine when it was first introduced was known as "Pounding Machine: Rex", so that the illustration which I now produce shows the machine under both names.

Cross-Int. 659. On page 2562 you testify with reference to "Trimming Machine — Rex Toe". If you have an illustration of that machine, will you kindly produce it?

Ans. I produce a cut entitled "Rex Toe Trimming Machine — Model B", which shows the machine as it was put out after September, 1906, incorporating the improvements referred to at the bottom of page 2563 of the record.

Cross-Int. 660. On page 2564 you testify with reference to "Pounding and Trimming Machine — Rex Rotary", and "Pounding and Trimming Machine — Model B: Rex Rotary". If you have an illustration of that machine, or those machines, if there are two of them, will you kindly produce the same?

Ans. I produce an illustration entitled "Rex Rotary Pounding and Trimming Machine — Model B". This machine, when it was first put out in July, 1908, was known as "Pounding and Trimming Machine — Rex Rotary", so that the illustration which I now produce shows the machine as it was put out under both names.

Cross-Int. 661. Will you kindly examine the illustration entitled "Rex Rotary Pounding and Trimming Machine — Model B", and

indicate thereon the parts which operate upon the shoe by suitable terms, connecting the same with a line?

Ans. As requested, I have written on the illustration the words "ironing", "blocking", "pounding", "toe trimming" and "oiling", connecting these words with lead lines to the appropriate parts as shown in the illustration.

Cross-Int. 662. In order to avoid encumbering the record with repeated interrogatories, I will ask you the following general question: On the following noted pages you testified with reference to the following machines: —

	Page
Separating machine: Hadaway stitch	2340
Compressing machine: Fisher	2423
Compressing machine — model No. 4: automatic heel	2425
Pounding machine — model C: Rex rotary	2570
Pounding and Beating-up machine — model A: Rex rotary	2570
	2570
Jointing machine: Goodyear — model A	2611
Blacking machine — model A: Crest heel	2622
Blacking machine — model B: Crest heel	2624
Repairing machine — model A: patent leather	2628
Assembling machine: Rex turn shoe	2631
Beading machine: Columbia	2632
Beveling machine — model B: Champion strip	2632
Building machine: Pyramid heel — models B, C and D	2632
Cementing machine: Hub lining — models E and F	2633
Cementing machine — model X: Stanbon channel	2633
Cementing machine: Star channel — model D	2634
Cutting and Scoring machine: Insole — models D and E	2635
Embossing machine — model B	2635
Flexible Innersole machine — model X: Goodyear	2637
Fudge Edge machine: Goodyear	2638
Grooving and Beveling machine: Goodyear power welt	2638
Marker: Improved Star sole	2640
Nurling machine — model A	2642
Opening machine — model C: Apex channel	2643

Page
Perforating machine — model B: Royal . . . 2643
Perforating machine — model M: Stanbon . . . 2643
Pincer: U S M C Bench 2644
Pricking machine: Premier heel 2644
Punching machine — model A: Royal tip . . . 2644
Reducing machine — model H: Rotary feather edge and shank 2645
Rounding machine: Goodyear heel seat . . . 2645
Rounding machine: Planet sole — models C and D . . 2645
Rounding and Randing machine: Goodyear heel seat . 2646
Sanding machine — model A: tap and sole . . . 2646
Scarfing machine — model N: tap 2646
Scalloping machine — model B: top piece . . . 2647
Scouring machine — model X: heel 2647
Skiving machine — model A: Champion shank . . 2648
Skiving machine: Eros Rand 2649
Skiving machine: Pluma — models C and D . . . 2649
Skiving and Finishing machine: Monarch counter and box toe 2649
Skiving or Rand splitting machine — model C: Apex tap . 2650
Slashing machine: XX welt 2650
Snipping machine: Goodyear insole toe . . . 2650
Softening machine: Toe — models C and D . . . 2651
Splitting machine: Empire — models C and D . . 2651
Splitting machine: Summit 2652
Stamping machine — model C: Eagle sole . . . 2652
Stamping machine — model C: Eagle upper . . . 2652
Stamping machine: Regent — models B and C . . 2653
Sticking machine — shank piece: model B . . . 2653
Trimming machine: spring heel 2655
Trimming machine: Ultima heel 2655
Turning machine: Goodyear forepart 2655
Turning machine: Goodyear heel 2656
Turning machine: Goodyear lip 2656
Turning machine: Goodyear welt edge 2656
Wheeling machine — No. 2: Goodyear impression stitch . 2657

If you have illustrations of those machines, will you kindly produce them?

Ans. I produce illustrations of the machines inquired about, which are entitled as follows: —

"Hadaway Stitch Separating Machine."
"Fisher Compressing Machine."
"Automatic Heel Compressing Machine — No. 4."
"Rex Rotary Pounding Machine — Model C."
"Rex Rotary Pounding and Beating-up Machine — Model A."
"Goodyear Jointing Machine — Model A."
"Crest Heel Blacking Machine — Model A."
"Crest Heel Blacking Machine — Model B."
"Patent Leather Repairing Machine — Model A."
"Rex Turn Shoe Assembling Machine."
"Columbia Beading Machine."
"Champion Strip Beveling Machine — Model B."
"Pyramid Heel Building Machine — Model B."
"Pyramid Heel Building Machine — Model C."
"Pyramid Heel Building Machine — Model D."
"Hub Lining Cementing Machine — Model E."
"Hub Lining Cementing Machine — Model F."
"Star Channel Cementing Machine — Model D."
"Insole Lip Cutting and Scoring Machine — Model D."
"Insole Lip Cutting and Scoring Machine — Model E."
"Embossing Machine — Model B."
"Flexible Innersole Machine — Model X: Goodyear."
"Goodyear Fudge Edge Machine."
"Goodyear Power Welt Grooving and Beveling Machine."
"Improved Star Sole Marker."
"Nurling Machine — Model A."
"Apex Channel Opening Machine — Model C."
"Royal Perforating Machine — Model B."
"Stanbon Perforating Machine — Model M."
U S M C Bench Pincer."
"Premier Heel Pricking Machine."
"Royal Tip Punching Machine — Model A."

"Rotary Feather Edge and Shank Reducing Machine—Model H."
"Goodyear Heel Seat Rounding Machine."
"Planet Sole Rounding Machine — Model C."
"Planet Sole Rounding Machine — Model D."
"Goodyear Heel Seat Rounding and Randing Machine."
"Tap and Sole Sanding Machine — Model A."
"Tap Scarfing Machine — Model N."
"Top Piece Scalloping Machine — Model B."
"Heel Scouring Machine — Model X."
"Champion Shank Skiving Machine — Model A."
"Eros Rand Skiving Machine."
"Pluma Skiving Machine — Model C."
"Pluma Skiving Machine — Model D."
"Monarch Counter and Box Toe Skiving and Finishing Machine."
"Apex Tap Skiving or Rand Splitting Machine."
"XX Welt Slashing Machine."
"Goodyear Insole Toe Snipping Machine."
"Toe Softening Machine — Model D."
"Empire Splitting Machine — Model C."
"Empire Splitting Machine — Model D."
"Summit Splitting Machine."
"Eagle Sole Stamping Machine — Model C."
"Eagle Upper Stamping Machine — Model C."
"Regent Stamping Machine — Model B."
"Regent Stamping Machine — Model C."
"Shank Piece Sticking Machine — Model B."
"Spring Heel Trimming Machine."
"Ultima Heel Trimming Machine."
"Goodyear Forepart Turning Machine."
"Goodyear Heel Turning Machine."
"Goodyear Lip Turner."
"Goodyear Welt Edge Turning Machine."

In the short time since you requested me to produce these illustrations, I have not been able to obtain illustrations of the two following machines: —

"Cementing Machine — Model X: Stanbon Channel."
"Wheeling Machine — No. 2: Goodyear Impression Stitch."

I may be able to furnish illustrations of these two machines at a later hearing.

Cross-Int. 663. I am uncertain whether the illustration of "Rapid Noiseless Wonder Splitting Machine" has been introduced in evidence. I will ask you therefore to kindly examine the illustration I now hand you, and state whether it properly illlustrates this machine, and if you answer yes, will you kindly write at the bottom of the illustration the proper title of the same?

Mr. PHILLIPS. Objected to as outside the order of the court.

Ans. The illustration submitted to me is a correct showing of the United Company's machine known as "Splitting Machine: Rapid Noiseless Wonder", and I have written that title on the cut.

Cross-Int. 664. I ask you the same question relative to the illustrations I now hand you. I have not in mind, however, the particular page upon which reference is made to these machines; but I will ask you to kindly examine the illustrations and state whether the titles marked thereon correctly identify the respective machines?

Ans. Cuts which have been handed to me correctly illustrate the following machines, the page of the printed record upon which they are mentioned being indicated in the following list opposite each name: —

	Page.
"Briggs Rough Rounding Machine"	2303
"Goodyear Universal Rounding and Channeling Machine — Model E"	2309
"Goodyear Universal Channeling Machine (Welt Work)"	2323
"Goodyear Universal Channeling Machine (Turn Work)"	2327
"Goodyear Outsole Channeling Machine"	2330
"Goodyear Welt Beating Machine"	2495
"Star Channel Cementing Machine — Model A" . .	2633
"Star Channel Cementing Machine — Model C" . .	2633
"Universal Double Clinch Machine"	2634
"Economy Insole Reinforcing Machine"	2491

[*The illustrations identified by the witness at this session are put*

in evidence as a single physical exhibit, and it is requested that the same be marked "Plaintiff's Exhibit 285".]

Cross-Int. 665. You kindly consented to produce a part of a heeling machine adapted to support a wood last. Will you kindly state briefly what the device is, and its employment in a heeling machine?

Mr. PHILLIPS. Objected to as outside the order of the court.

Ans. The device submitted for my inspection is the last support which was used on the Plant "heel attacher on wood lasts" and which is referred to on page 23b of Defendants' Exhibit 273.

[*Last support used on Plant "heel attacher on wood lasts" is offered in evidence, and marked "Plaintiff's Exhibit 286".*

Mr. WEBSTER. Unless through inadvertence, accident or mistake, I have omitted to interrogate the witness with reference to some other matters, the cross-examination is closed, it being stated as at the outset of the cross-examination of this witness that the cross-examination is *de bene* and without waiver of objections, notices and motions.

Direct Examination resumed by Mr. PHILLIPS.

Int. 666. In your cross-examination your attention was called to page 2299 of the printed record and you were interrogated in regard to certain statements made by you in your direct examination before the examiner to the effect that certain mechanisms embodied in the model M stitcher were "not shown in a granted patent". Please state whether or not since that testimony was given by you any United States Letters Patent have been granted to the United Shoe Machinery Company relating to such mechanisms; if so, please produce such patent and point out the claims therein which, in your opinion, describe such mechanisms.

Mr. WEBSTER. Objected to as going into matters relating to patent issued after the filing of the bill herein, and therefore incompetent, inadmissible and irrelevant.

Ans. I produce a copy of patent No. 1,087,602, February 17, 1914, Nash, granted on an application filed June 16, 1906. This patent sets forth in all of its twelve claims mechanism embodied in

the present standard commercial out-sole stitching machine put out by the United Company, officially known as "Lockstitch Machine: Goodyear Outsole Rapid — Model M." The mechanisms set forth in the twelve claims of this patent have been incorporated in this machine since it was first put out it June, 1911. Each of the twelve claims recites the mechanism or features of the mechanism employed in that machine for raising the presser-foot from engagement with the work when the machine stops, and for lowering the presser-foot into engagement with work when the machine starts. A typical claim of this patent is the first, which is as follows: —

"[1] A shoe sewing machine having, in combination, stitch forming devices including a needle, driving mechanism therefor, a presser-foot, means operating automatically to raise the presser-foot at a certain point in each cycle of operations of the stitch forming devices, means under the control of the operator for stopping the machine at another point in the cycle of operations with the needle raised from the work, and mechanism normally inoperative during the sewing of the seam operating automatically to lift the presser-foot as the machine is stopped."

[*A Patent Office copy of the Nash patent referred to by the witness in his last answer is offered in evidence as "Defendants' Exhibit 346".*]

Mr. WEBSTER. The introduction of the exhibit is objected to for the reasons heretofore stated.

Int. 667. Referring to Defendants' Exhibit 346, and for the purpose of further identifying the same, will you state whether or not that is a patent which was issued upon application referred to in Defendants' Exhibit 273 in connection with "Stitcher (Plant catalogue, page 112)", and, if so, whether or not the claims referred to in said exhibit as allowed claims are included among the claims in said patent?

Mr. WEBSTER. The same objection repeated.

Ans. Yes, sir; this Nash patent, No. 1,087,602, was granted on application, serial No. 321,958, filed June 16, 1906, as to which the statement is made on page 17 of Defendants' Exhibit 273 that the allowed claims 3, 5, 7, 10 and 12 of that application were in-

fringed by the Plant stitcher. Those allowed claims were identical, respectively, with claims 3, 5, 7, 10 and 12 of the patent No. 1,087,602.

Int. 668. Please state whether or not, since your testimony in chief before the examiner, United States Letters Patent have been granted to the United Shoe Machinery Company relating to any other of the machines referred to by you in such direct examination. If so, please produce such patents, state to what machines they relate, and point out the claims, if any, therein, which describe mechanisms embodied in said machine.

[*It is stipulated that the objection heretofore made shall have the same force and effect as if repeated at length, wherever objection is made in the form of "Objection repeated", or "Same objection".*]

Mr. WEBSTER. Same objection repeated.

Ans. A number of United States Letters Patent have been granted to the United Shoe Machinery Company since I gave my testimony in chief before the examiner. These patents are as follows:—

SHOE MACHINE, MODEL K, GOODYEAR WELT AND TURN.

No. 1,076,878, October 28, 1913, Eppler [application filed July 27, 1911].

No. 1,079,436, November 25, 1913, Perry [application filed May 2, 1910].

Of these patents, the Eppler patent No. 1,076,878 sets forth in all of its twenty claims improvements embodied in the welt-holding, welt-cutting and welt-measuring mechanisms of shoe machine, model K, Goodyear welt and turn, as that machine has been constructed since it was first put out in June, 1911. Typical claims of this patent are the first, fourth and fifteenth, which are as follows:—

"[1] A sewing machine, having, in combination, stitch forming mechanism, devices for severing and holding the welt at the completion of the sewing, and means for maintaining the holding devices in engagement with the welt during at least one cycle of operations of the machine at the beginning of the sewing operation, substantially as described."

"[4] A sewing machine, having, in combination, stitch forming mechanism, welt severing and holding devices mounted for movement with the shoe, and means for operating the devices to sever and hold the welt at the completion of the sewing operation, substantially as described."

"[15] A sewing machine, having, in combination, stitch forming mechanism, and means for determining the amount of welt drawn forward in the removal of the shoe rendered active by the reversal of the machine, substantially as described."

Perry patent No. 1,079,436 sets forth in broad terms in claims 7, 8, 9 and 10 improvements embodied in the welt-holding mechanism of shoe machine, model K, Goodyear welt and turn, ever since that machine was first put out in June, 1911. A typical claim is the seventh, which is as follows:—

"[7] A welt sewing machine, having, in combination, stitch forming mechanism, a welt holder for holding the end of the welt in the rear of the sewing point, and mechanism for retaining the holder in engagement with the welt and moving it with the shoe independently of this engagement with the shoe during at least one cycle of operations of the machine, substantially as described."

SHOE MACHINE, MODEL G, GOODYEAR WELT AND TURN.

No. 1,076,201, October 21, 1913, Eppler [application filed Novem- 22, 1909].

The improvements set forth in claims 1, 2, 3, 4, 7 and 8 to 11, inclusive, of this patent were embodied in shoe machine, Goodyear welt and turn, model G, from the time of its introduction in October, 1908, until it was superseded by shoe machine, model K, Goodyear welt and turn. Among the improvements defined in these claims, the welt guide and means for operating it were important. The nature of this improvement is well indicated in the first claim of that patent, which is as follows:—

"[1] An inseam shoe sewing machine, having, in combination, stitch forming devices, a welt guide, means acting during the normal operation of the machine in sewing a seam to move the guide toward and from the shoe during each cycle of operations of the machine, and means for holding the guide in advance position during at least one cycle of operations of the machine."

ASSEMBLING MACHINE, REX.

No. 1,076,620, October 21, 1913, Ashton [application filed October 26, 1907].

No. 1,081,872, December 16, 1913, Stiggins [application filed October 13, 1902].

The first of these patents, No. 1,076,620, is the patent on the method practiced in the operation of assembling machine, Rex. On pages 2557 and 2558 of the record I stated that this method was set forth in the claims of an allowed application filed October 26, 1907, and that the patent would be granted on this application October 21, 1913. This patent No. 1,076,620 is the patent which was granted on that application. All of the five claims of that patent define the method which is practiced in the operation of both models of assembling machine, Rex. The first claim of the patent is quoted on page 2558 of the record.

Claims 7 and 15 of patent 1,081,872 set forth in broad terms the organization for supporting the shoe for the operation of the machine and for operating that in proper time relation to the operations of other parts of the assembling machine. The improvement set forth in these two claims, 7 and 15, has been incorporated in assembling machine, Rex, and its successor, assembling machine, model E, Rex, since September, 1905.

NAILING MACHINE: ALPHA WOOD HEEL.

No. 1,081,917, December 16, 1913, Tripp [application filed August 1, 1907].

On page 2464 of the record I stated that this machine was not shown in any patent which had as yet been granted, but that it was shown in the drawings and described in claims of a pending application filed August 1, 1907. This patent, No. 1,081,917, was granted on the application to which I then referred. The improvements set forth in all of the eighteen claims of this patent have been embodied in nailing machine, Alpha wood heel, ever since that machine was first put out in 1907. A typical claim is the first: —

"[1] A heel attaching machine, having in combination, means for pressing a heel upon the heel seat of a shoe arranged to exert

pressure toward the heel seat upon a predetermined portion of the surface of the heel at the rear intermediate its tread surface and its heel seat surface and constructed for adjustment to accommodate heels varying in size or contour, and means for securing the heel to the shoe."

The improvements set forth in the claims of this Tripp patent No. 1,081,917 made it possible for the first time in the industry to attach wooden heels to shoes by a machine.

CEMENTING MACHINE, MODEL F: HUB LINING.

No. 1,080,959, December 9, 1913, Eaton [application filed September 19, 1908].

The improvements set forth in claims 3, 4 and 5 of this patent No. 1,080,959 have been embodied in cementing machine, model F, Hub lining, since the machine was first introduced in October, 1911.

FINISHING MACHINE, U. S. M. C. BUTTONHOLE.

No. 1,080,341, December 2, 1913, Hill [application filed January 24, 1910].

No. 1,080,342, December 2, 1913, Hill [application filed March 7, 1911].

No, 1,080,343, December 2, 1913, Hill [application filed April 1, 1911].

Of these patents, No. 1,080,341 sets forth the general organization of finishing machine, U.S.M.C. buttonhole, in claims 1, 2, 3, 5, 6, 15 to 22, 41, 45, 54, 55 and 59. The starting and stopping mechanism of this machine is set forth in claims 3, 8 to 11 and 15 to 17 of patent No. 1,080,342. The needle-actuating mechanism of this machine is defined in claims 1, 2, 4, 5, 6 and 17 of patent No. 1,080,343.

GROOVING AND BEVELING MACHINE, MODEL X: GOODYEAR WELT.

No. 1,076,073, October 21, 1913, Stanbon [application filed December 9, 1911].

This patent sets forth in all of its six claims improvements which were embodied in the Plant welt slasher and groover, shown on page 83 of the Plant catalogue of Plaintiff's Exhibit 266. While

the application for the patent was not filed until after the Plant acquisition, the improvements were embodied in the Plant welt slasher and groover before the acquisition of the Plant patents by the United Company.

LASTING MACHINE, U. S. M. C., No. 5.

No. 1,085,400, January 27, 1914, Brown [application filed March 1, 1911].

The twenty-eighth claim of this patent sets forth in broad terms an important improvement embodied in the hold-down mechanism of lasting machine, U. S. M. C., No. 5, which was adopted in August, 1910, and has been used continuously on the machine ever since that time.

LOCKSTITCH MACHINE, MODEL M: GOODYEAR OUTSOLE RAPID.

No. 1,080,877, December 9, 1913, Ashworth [original application filed October 3, 1910].

No. 1,087,602, February 17, 1914, Nash [application filed June 16, 1906].

The Nash patent No. 1,087,602 was discussed by me in my answer to a preceding interrogatory.

The Ashworth patent No. 1,080,877 sets forth in each of its five claims an improvement in the needle oiling mechanism which has been embodied in lockstitch machine, model M, Goodyear out-sole rapid, since that machine was first put out in June, 1911, and was also embodied in lockstitch machine, model K, Goodyear out-sole rapid, from the time when that machine was first put into commercial use in May, 1910.

MAKING MACHINE: BUTTONHOLE.

No. 1,080,342, December 2, 1913, Hill [application filed March 7, 1911].

No. 1,088,420, February 24, 1914, Hill [original application filed February 10, 1912].

The first of these patents is one of the patents on finishing machine, U. S. M. C., buttonhole, to which I have already referred.

One claim, the fifteenth, of this patent sets forth mechanism which is also embodied in making machine, buttonhole.

All of the eight claims of patent No. 1,088,420 set forth improvements which are embodied in making machine, buttonhole.

MARKER: IMPROVED STAR SOLE.

No. 1,083,278, January 6, 1914, Gordon [application filed March 2, 1911].

The two claims of this patent set forth improvements which have been embodied in marker, improved Star sole, since the latter part of 1910.

MOLDING MACHINE: AMERICAN TWIN SOLE.

No. 1,084,526, January 13, 1914, Ball [application filed November 14, 1908].

Claims 1 to 5 and 8 to 11 of this patent set forth improvements which have been embodied in molding machine: American twin sole, model B, since September, 1911, and molding machine: American twin sole, model C, since that machine was first introduced in May, 1911. The improvements set forth in these claims are designed to enable an expert operator to run the machines at a higher speed than was practicable before the improvements were incorporated in the machines, while at the same time rendering the machines safe and satisfactory for unskilled operators.

POUNDING AND BEATING-UP MACHINE, MODEL A: REX ROTARY.

No. 1,076,940, October 28, 1913, Ashton [application filed September 11, 1911].

This patent is the one to which I made general reference at the bottom of page 2570 of the record, and sets forth in all of its twenty-three claims improvements embodied in pounding and beating-up machine, model A, Rex rotary. Typical claims of this patent are the first and twelfth, which are as follows: —

"[1] In a machine of the class described, a rotary beater comprising a carrier and a plurality of beating members consisting of spiral coils arranged about the periphery of the carrier and mounted to permit them to move radially with relation to the axis of the carrier."

"[12] A rotary beater comprising a carrier and a plurality of beating members consisting of an annular series of resilient coils arranged about the periphery of the carrier and extending lengthwise thereof to form collectively a normally cylindrical beating surface concentric with the axis of rotation of the carrier."

PULLING AND RESETTING MACHINE, GOODYEAR TACK.

No. 1,081,456, December 16, 1913, MacKenzie [application filed January 11, 1911].

This patent sets forth in all of its fourteen claims, and illustrates in its drawings, the commercial form of the stay tack driving mechanism of pulling and resetting machine, Goodyear tack. The mechanism was referred to near the top of page 2528 of the record.

PULLING-OVER MACHINE, MODELS A, B AND C: REX.

No. 1,082,487, December 30, 1913, Bates [application filed March 2, 1908].

No. 1,082,488, December 30, 1913, Bates [original application filed March 2, 1908].

These two patents set forth improvements which were first embodied in pulling over machine, model A, in June, 1910, which were incorporated in pulling-over machine, model B, Rex, when that machine was first put out in July, 1910, and have been incorporated in pulling-over machine, model C, Rex, since that machine was first shipped in March, 1911.

REDUCING MACHINE, GOODYEAR OUTSOLE CHANNEL SHANK.

No. 1,080,171, December 2, 1913, Ross and Freeman [application filed May 27, 1909].

This patent, which was granted on the application referred to by me near the bottom of page 2514 of the record, shows in its drawings substantially the commercial reducing machine, Goodyear outsole channel shank, and sets forth in all of its twenty claims mechanisms embodied in that machine. Typical claims of this patent are the following:—

"[1] A skiving machine, having, in combination, a work support arranged to support the projecting edge of the sole of a shoe in position to be acted upon by a skiving knife and a feed roll rela-

tively yielding to compensate for variations in the thickness of the sole, and a skiving knife blade maintained in fixed relation to the feed roll with its edge continuously in position to shave a skiving from the lower outer margin of the sole, substantially as described."

"[9] A skiving machine, having, in combination, devices adapted to engage the opposite surfaces of a channeled, attached outsole, for feeding the same, a channel guard and a skiver extending between the devices and terminating adjacent the guard, substantially as described."

ROUNDING AND RANDING MACHINE: GOODYEAR HEEL SEAT.

No. 1,080,191, December 2, 1913, Baxter [application filed April 4, 1912].

The commercial form of this machine is shown in the drawings of this patent and is set forth in claims 4 to 10. This patent, No. 1,080,191, is the application referred to by me on page 2646 of the record. The improvements set forth in these claims have been embodied in this machine throughout its entire period of development, beginning early in 1911.

SCARFING MACHINE — MODEL M: TAP.

No. 1,082,629, December 30, 1913, Hadaway [application filed March 8, 1910].

The improvements set forth in all of the eleven claims of this patent have been embodied in this machine since its introduction in September, 1910.

SKIVING MACHINE — MODELS C AND D: PLUMA.

No. 1,079,462, November 25, 1913, Alexander [application filed November 8, 1909].

The improvements set forth in the first six claims of this patent have been incorporated in skiving machine, model C, Pluma, since the machine was first put out in April, 1909, and in skiving machine, model D, Pluma, since that model was first put out in 1910.

SKIVING MACHINE, MODEL D: PLUMA.

No. 1,076,934, October 28, 1913, Alexander [application filed October 16, 1909].

No. 1,084,521, January 13, 1914, Alexander [application filed February 21, 1913].

The improvements set forth in all six claims of patent No. 1,076,934 were embodied in skiving machine, model D, Pluma, when that machine was first put out in November, 1910, and these improvements have been embodied in that machine ever since that date.

The improvements set forth in all of the four claims of patent No. 1,084,521 have been embodied in skiving machine, model D, Pluma, since November, 1912.

SNIPPING MACHINE, GOODYEAR INSOLE TOE.

No. 1,087,578, February 17, 1914, Hadaway [application filed October 13, 1910].

This machine is illustrated in its commericial form in the drawings of this patent No. 1,087,578, and all of the twelve claims of the patent set forth improvements which have been embodied in the machine since it was first put out in May, 1911. A typical claim is the first:—

"[1] An insole toe cutting machine, having, in combination, a work table, two power driven knives to co-operate therewith, one of said knives being arranged to incise the lip of an insole placed on the work table, and the other of said knives being arranged to incise the channel flap of said insole, engaging means to position the insole with relation to the knives."

Mr. WEBSTER. Answer objected to for the reason that it relates in substantially all its parts to matters not even remotely touched upon in the cross-examination of this witness, and for the further reason that it relates wholly to patents issued after the filing of the bill herein, and for the further reason that the testimony is inadmissible and incompetent, having no bearing whatever on the issues involved herein at the date of the filing of the bill, and counsel for the plaintiff moves that the answer be stricken from the record.

Int. 669. Have you collected in a single volume the patents referred to in your last answer?

Ans. I have and produce a volume of patents entitled "Copies

of Patents recently granted on machines referred to in Mr. Howard's direct testimony before the Examiner."

[*Volume of patents entitled "Copies of Patents recently granted on machines referred to in Mr. Howard's direct testimony before the Examiner" is marked "Defendants' Exhibit 347".*]

Mr. WEBSTER. The introduction of the exhibit is objected to for the reasons stated in the objections to the question and answer.

Mr. PHILLIPS. The attention of the Court is called to the introduction by the plaintiff, during Mr. Howard's present cross-examination, of Exhibit 285, illustrations of machines testified to by Mr. Howard, and also to Mr. Howard's cross-examination as to his statements in his direct examination before the examiner as to mechanisms forming the subject-matter of patents not yet granted.

Mr. WEBSTER. Counsel for the plaintiff states on the record that while it is true that various illustrations were introduced in the record in the cross-examination of this witness, no reference was made at the time with reference to patents issued either before or after the filing of the bill, and attention is called to the fact that among the patents offered in evidence by the defendants and marked "Defendants' Exhibit 347" there appear various patents, the applications for which were filed after the filing of the bill herein.

Int. 670. Please state on the record the number, date and name of patentee of the several patents forming Defendants' Exhibit 347.

Mr. WEBSTER. The same objection repeated.

Ans. DEFENDANTS' EXHIBIT 347.

No. 1,076,073, October 21, 1913, Stanbon [application filed December 9, 1911].

No. 1,076,201, October 21, 1913, Eppler [application filed November 22, 1909].

No. 1,076,620, October 21, 1913, Ashton [original application filed August 15, 1906].

No. 1,076,878, October 28, 1913, Eppler [application filed July 27, 1911].

No. 1,076,934, October 28, 1913, Alexander [application filed October 16, 1909].

No. 1,076,940, October 28, 1913, Ashton [application filed September 11, 1911].

No. 1,079,436, November 25, 1913, Perry [application filed May 2, 1910].

No. 1,079,462, November 25, 1913, Alexander [application filed November 8, 1909].

No. 1,080,171, December 2, 1913, Ross and Freeman [application filed May 27, 1909].

No. 1,080,191, December 2, 1913, Baxter [application filed April 4, 1912].

No. 1,080,341, December 2, 1913, Hill [application filed January 24, 1910].

No. 1,080,342, December 2, 1913, Hill [application filed March 7, 1911].

No. 1,080,343, December 2, 1913, Hill [application filed April 1, 1911].

No. 1,080,877, December 9, 1913, Ashworth [original application filed October 3, 1910].

No. 1,080,959, December 9, 1913, Eaton [application filed September 19, 1908].

No. 1,081,456, December 16, 1913, MacKenzie [application filed January 11, 1911].

No. 1,081,872, December 16, 1913, Stiggins [application filed October 13, 1902].

No. 1,081,917, December 16, 1913, Tripp [application filed August 1, 1907].

No. 1,082,487, December 30, 1913, Bates [application filed March 2, 1908].

No. 1,082,488, December 30, 1913, Bates [original application filed March 2, 1908].

No. 1,082,629, December 30, 1913, Hadaway [application filed March 8, 1910].

No. 1,083,278, January 6, 1914, Gordon [application filed March 2, 1911].

No. 1,084,521, January 13, 1914, Alexander [application filed February 21, 1913].

No. 1,084,526, January 13, 1914, Ball [application filed November 14, 1908].

No. 1,085,400, January 27, 1914, Brown [application filed March 1, 1911].

No. 1,087,578, February 17, 1914, Hadaway [application filed October 13, 1910].

No. 1,087,602, February 17, 1914, Nash [application filed June 16, 1906].

No. 1,088,420, February 24, 1914, Hill [original application filed February 10, 1912].

Int. 671. In your cross-examination you were asked about Plaintiff's Exhibits No. 281 and 282. Have you anything to add to your testimony in regard to such exhibits; if so, state it.

Ans. With reference to Plaintiff's Exhibit 282 I stated, on page 4352 of the typewritten record [printed page 2836 (26)], that the shoe of this exhibit "appears to be a woman's welt shoe, unusually heavy and of large size". I should have added that the shoe of this exhibit is what is known in the trade as a "mannish shoe". On comparing the shoe of Exhibit 282 with the man's shoe of Exhibit 281, it will be noted that the sole of Exhibit 282 is as heavy as the sole of the man's shoe of Exhibit 281, and that the heel of the woman's shoe of Exhibit 282 is of substantially the same height as the heel of the shoe of Exhibit 281.

At no time during the past sixteen or eighteen years has more than a very small percentage of women's shoes been made as heavy or substantially as heavy as the shoe of Plaintiff's Exhibit 282. The reason why relatively few women's shoes have been of this character, that is, of the type known as "mannish shoe", is that it is a shoe which is purchased and worn only by well-to-do women who can afford to have a large number of pairs of shoes for all sorts of occasions. Such a shoe would be worn only occasionally, in stormy weather, or for tramping or mountain climbing. In other words, the shoe of Plaintiff's Exhibit 282 is not at all a typical woman's shoe. I produce three women's welt shoes of different types which I regard as typical women's shoes.

[*Three women's welt shoes are offered in evidence, and marked,*

respectively, "Defendants' Exhibit 348", "Defendants' Exhibit 349" and "Defendants' Exhibit 350".]

Practically every woman has a pair of shoes of the character indicated by Defendants' Exhibits 348 and 349, which are ordinary women's street shoes. Defendants' Exhibit 350 is a more dressy shoe, and nearly every woman provides herself with a pair of shoes of this character for social occasions. The ordinary woman, instead of going to the expense of providing herself with an additional pair of heavy shoes, such as is illustrated in Plaintiff's Exhibit 282, would, in stormy weather, wear a shoe of the character indicted in Defendants' Exhibit 348 and 349, with a pair of rubbers to protect her shoes and feet.

Mr. WEBSTER. All that portion of the foregoing answer, beginning with "at no time during the past sixteen or eighteen years" is objected to as in the nature of argument pure and simple and as in no wise in the nature of testimony responsive to, or to meet any, interrogatories submitted by the plaintiff. Notice is given that motion will be made to strike out all the said argument at some convenient time in the future.

Mr. PHILLIPS. The redirect examination of this witness is closed, unless counsel shall find that by inadvertence he has neglected to ask the witness a question.

[*Adjourned to 10 A. M., March 4, 1914.*]

BOSTON, MASS., March 4, 1914.

Cross Examination resumed by Mr. WEBSTER.

Mr. WEBSTER. The testimony with reference to patents issued after the filing of the bill herein having been seasonably objected to, the recross-examination will be *de bene esse* and without waiver of the objections entered.

Cross-Int. 672. You have now testified with reference to twenty-eight patents, all issued after the filing of the bill herein. Kindly state whether any of those patents were issued upon applications which were acquired in the Plant acquisition.

Mr. PHILLIPS. Objected to as outside the order of the court.

Ans. No, sir; although I ought to explain that patent No.

1,076,073, October 21, 1913, Stanbon, granted on an application filed December 9, 1911, sets forth in its claims improvements which were made by C. P. Stanbon for Plant and which were incorporated in the Plant welt slasher and groover at the date of the acquisition of the Plant patents in September, 1910.

Cross-Int. 673. One would be led to believe from your employment of the term "welt slasher and groover" that the Stanbon patent related to a machine somewhat broadly. Kindly state if it is not a fact that the Stanbon patent referred to relates simply and only to a box for holding rolls of welt, which box might be employed in connection with any machine wherein it was desirable to hold a roll of welting.

Mr. PHILLIPS. Question objected to as containing argumentative statements of counsel, and as improper cross-examination.

Ans. As stated in the interrogatory, patent No. 1,076,073 sets forth and claims "improvements in boxes for holding rolls of welt". Those improvements could doubtless be advantageously used on any machine presenting similar difficulties and problems to those which were encountered in the use of the Plant welt slasher and groover. The improvements were, however, designed for the Plant welt slasher and groover and are illustrated in the drawings of the patent as incorporated in that machine. The improvements of this patent No. 1,976,073 are also illustrated as embodied in the Plant welt slasher and Groover in the cut on page 82 of the Plant catalogue Plaintiff's Exhibit 266.

Cross-Int. 674. And would you say that the welt slasher and groover would be inoperative without having incorporated therein the mechanism of the Stanbon patent about which you have been testifying?

Ans. No, sir; I should not wish to make so strong a statement as that as to the value of the improvements of patent No. 1,076,-073. I should prefer to characterize these improvements as very useful parts of the Plant welt slasher and groover.

Cross-Int. 675. Among the twenty-eight patents issued after the filing of the bill herein, altogether forming the volume of copies of patents Defendants' Exhibit 347, I observe that four, issued on

the applications of Hill, relate to buttonhole finishing. Am I right, that all of the Hill patents in the exhibit relate to buttonholes and buttonhole-sewing machines, and do not relate in any wise to welt and turn machines or rapid out-sole stitchers?

Mr. PHILLIPS. Question objected to as containing argumentative statements of counsel, and as improper cross-examination.

Ans. The statements in the interrogatory not being entirely correct, I will answer the question by stating that three of the Hill patents, namely, No. 1,080,341, No. 1,080,342 and No. 1,080,343, relate to buttonhole finishing machines and one of the Hill patents, No. 1,088,420, sets forth improvements in buttonhole-making machines.

Cross-Int. 676. I note that all the twenty-eight patents issued after the filing of the bill were issued to the United Shoe Machinery Company. Can you state whether the United Shoe Machinery Company had a transfer of these alleged inventions or applications at the time they were filed and had the control and management of the applications during the time they were pending?

Ans. That is true as to nearly all of the applications upon which were granted the patents included in Defendants' Exhibit No. 347. It may be true of all of them, but I am in doubt as to several without examining the files of our assignments.

Cross-Int. 667. I observe the patent issued on the application of E. A. Stiggins, lasting machine, dated December 16, 1913, recites that the application was filed on October 13, 1902. I note also that the drawings are signed by yourself as attorney for the applicants. Have you any objection to explaining to the court the cause of eleven years' delay in the issue of that patent after the filing of the application?

Mr. PHILLIPS. Question objected to as entirely outside the scope of the order of the court under which this testimony is being taken, and as being incompetent, immaterial and irrelevant.

Ans. I have no objection whatever to making the explanation suggested, but I should need to refresh my recollection by examination of the file of the application for this patent, which I have not at hand at this time.

Cross-Int. 678. Is it your opinion that the Plant machines, or any of them, fell within the terms of the claims of any of the patents to which you have testified and which issued after the filing of the bill herein? And, if you answer yes, kindly answer briefly, stating the particular kind of machines, but without going into detail.

Mr. PHILLIPS. Objected to as outside the scope of the order of the court under which this testimony is being taken.

Ans. I fear that I do not quite understand the interrogatory. Of course, as is set forth in detail in Defendants' Exhibit 273, entitled "Infringement by Plant machines of patents and applications of the United Shoe Machinery Company", the Plant machines embodied improvements set forth in the claims of a number of patents owned by the United Shoe Machinery Company which were issued after the filing of the petition in this suit, and which, when issued, contained claims which were allowed in the respective applications prior to September, 1910, the subjects-matter of which claims were incorporated in Plant machines. I am in doubt as to whether I should construe the interrogatory as including those patents.

Cross-Int. 679. Did the Plant welt and turn machine contain mechanism such as is set forth in the claims of the patent to Eppler No. 1,076,201, dated October 21, 1913? I do not ask you for the particular claims, if any, but simply a brief answer, yes or no, if you can answer in that manner.

Mr. PHILLIPS. The same objection.

Ans. No, sir.

Cross-Int. 680. I ask the same question with reference to patent to Eppler No. 1,076,878, dated October 28, 1913, and ask you to consider the question as applying to both welters and stitchers?

Mr. PHILLIPS. The same objection.

Ans. No, sir.

Cross-Int. 681. Did the Plant welt and turn machine contain a mechanism such as defined in any of the claims of patent to Perry No. 1,079,436, dated November 25, 1913?

Mr. PHILLIPS. The same objection.

Ans. No, sir.

Cross-Int. 682. Did any of the Plant machines contain mechanism such as is defined in any of the claims of patent to Baxter No. 1,080,191, dated December 2, 1913?

Mr. PHILLIPS. The same objection.

Ans. No, sir.

Cross-Int. 683. Did any of the Plant machines contain a mechanism such as is referred to in any of the claims of patent to Ashworth No. 1,080,877, dated December 9, 1913?

Mr. PHILLIPS. The same objection.

Ans. No, sir.

Cross-Int. 684. Did any of the Plant machines contain a mechanism such as is referred to in the claims of the patent to MacKenzie, tack-driving machine, No. 1,081,456, dated December 16, 1913?

Mr. PHILLIPS. The same objection.

Ans. No, sir.

Cross-Int. 685. The same question is asked with reference to patent to Stiggins, lasting machine, No. 1,081,872, dated December 16, 1913?

Mr. PHILLIPS. The same objection.

Ans. No, sir.

Cross-Int. 686. The same question is asked with reference to patent to Tripp, heel-attaching machine, No. 1,081,917, dated December 16, 1913.

Mr. PHILLIPS. The same objection.

Ans. Yes, sir; seven claims of the application for that patent No. 1,081,917, December 16, 1913 (application filed August 1, 1907), were infringed by both the Plant heeler and the Plant heel attacher on wood lasts.

Cross-Int. 687. The same question is asked with reference to patent to Bates, machine for use in the manufacture of boots and shoes, No. 1,082,487, dated December 30, 1913?

Mr. PHILLIPS. The same objection.

Ans. No, sir.

Cross-Int. 688. The same question is asked with reference to

patent to Ball, starting and stopping mechanism, No. 1,084,526, January 13, 1914?

Mr. PHILLIPS. The same objection.

Ans. No, sir.

Cross-Int. 689. The same question is asked with reference to patent to Brown, hold-down, No. 1,085,400, January 27, 1914?

Mr. PHILLIPS. The same objection.

Ans. No, sir.

Cross-Int. 690. The same question is asked with reference to patent to Hadaway, insole toe-cutting machine, No. 1,087,578, dated February 17, 1914?

Mr. PHILLIPS. The same objection.

Ans. No, sir.

Cross-Int. 691. The same question is asked with reference to patent to Nash, sewing machine, No. 1,087,602, dated February 17, 1914?

Mr. PHILLIPS. The same objection.

Ans. Yes, sir; as pointed out on page 17 of Defendants' Exhibit 273, the Plant stitcher infringed five allowed claims of the application for patent No. 1,087,602, February 17, 1914, Nash (application filed June 16, 1906).

Cross-Int. 692. Referring now briefly to your testimony with reference to Plaintiff's Exhibits 281 and 282, I understand you to say that at no time during the past sixteen or eighteen years has more than a very small percentage of women's shoes been made as heavy, or substantially as heavy, as Plaintiff's Exhibit 282. Will you kindly state to the court what experience you have had during the last sixteen or eighteen years to qualify you to testify with reference to what kind of shoes women have used during that period?

Ans. Practically all my experience during that period qualifies me to express that opinion.

Cross-Int. 693. Have you sold shoes at wholesale or retail?

Ans. No, sir.

Cross-Int. 694. Do you know what kind of shoes women who are employed on farms wear?

Ans. Generally speaking, I think I do.

Cross-Int. 695. Do you say they do not wear a shoe as heavy as Plaintiff's Exhibit 282?

Ans. Probably no woman employed on a farm ever wears a welt shoe, except possibly a dress shoe.

Cross-Int. 696. I am not asking for probabilities; I am asking for what you absolutely know about it. I apprehend the court is desirous of getting at the facts from someone who has actual knowledge of the facts. Do you say you know of your own knowledge what character of shoe is generally worn by women employed in and about farms throughout the United States?

Ans. I think I may say that I know that women employed as servants on farms usually wear cheaper shoes than welt shoes.

Cross-Int. 697. Now, will you give the court the benefit of your experience, stating how you get the information?

Ans. It is common trade knowledge.

Cross-Int. 698. And are you engaged, or have you been engaged, in the sale of shoes?

Ans. No, sir.

Cross-Int. 699. Do you know what kind of shoes the women wear out in the hop picking regions?

Ans. I know that the shoes which are manufactured for women engaged in employments of that character are not welt shoes.

Cross-Int. 700. Then you have no personal knowledge, have you, as to what the women do wear in the hop picking regions?

Ans. I never observed the shoes worn by women engaged in hop picking.

Cross-Int. 701. Have you any knowledge of the kind of shoe largely worn by the women of northern Vermont and New Hampshire?

Ans. The kind of shoes worn by women in that part of the country, as in other parts of the country, depends largely upon the condition of their purses.

Cross-Int. 702. Then, do you tell the Court that, from your knowledge and experience, none but women who can afford to have several pairs of shoes wear shoes like Plaintiff's Exhibit No. 282?

Ans. Yes, sir; as a general rule that is correct.

Cross-Int. 703. And you make that statement founded on your experience as set out in the record; is that correct?

Ans. Yes, sir; that statement is based upon my experience and upon information which may be characterized as trade knowledge.

Cross-Int. 704. Now, Mr. Howard, is it not a fact that there are very many shoes for women that are fully as heavy, and made of as heavy material, as very many light-weight shoes made for and used by men?

Mr. PHILLIPS. Question objected to as outside the order of the court.

Ans. Yes, sir; it is a fact that many welt shoes of the character of Plaintiff's Exhibit No. 282, which is to all intents and purposes a man's shoe, are made each year; but, as I have previously testified, the number is relatively few as compared with the number of women's welt shoes which are made each year.

Cross-Int. 705. Now, do you say that Plaintiff's Exhibit 282 is a shoe for men or a shoe for women?

Ans. The shoe of Plaintiff's Exhibit 282, which, as I have previously testified, is a woman's "mannish shoe", was undoubtedly meant for women's wear, as the parts of the upper are shaped on the lines of a woman's shoe.

Mr. WEBSTER. In view of the attitude of the witness in declining to answer the questions without incorporating in his answer matter which seems evasive, to which the attention of the Court is respecfully called, counsel for plaintiff will not proceed further with the cross-examination.

The WITNESS. If counsel for the United States will kindly point out any interrogatory which has not been satisfactorily answered, I will endeavor to correct any errors which I have made as indicated by the interrogatory.

Mr. WEBSTER. The attention of the witness is called to the various questions which might have been answered by yes or no, and which, in fact, have been answered by matter in the nature of argument and evasion rather than by a direct answer to the question.

Mr. PHILLIPS. The attention of the Court is called to the fact that the record does dot substantiate any such statement on the part of counsel for the plaintiff. So far as at present advised, there will be no further redirect examination of this witness.

NELSON W. HOWARD.

Attest: CHARLES K. DARLING, *Special Examiner.*

[*Adjourned to 2* P. M., *Thursday, March 5, 1914.*]

ADDITIONAL EVIDENCE FOR THE UNITED STATES.

TAKEN PURSUANT TO ORDER OF COURT, ENTERED FEBRUARY 10, 1914, BEFORE ME,

CHARLES K. DARLING,
Special Examiner.

BOSTON, MASS., March 5, 1914.

Present:

ALLEN WEBSTER, Esq., *Special Assistant to the Attorney General,*
WILLIAM S. GREGG, Esq., *Assistant to the Attorney General,*
of Counsel for Complainant;
FREDERICK P. FISH, Esq., and BENJAMIN PHILLIPS, Esq.,
of Counsel for Defendants.

SECOND DEPOSITION OF CHARLES McCORMICK CHAPMAN.

Direct Examination by ALLEN WEBSTER, Esq., *of Counsel for* THE UNITED STATES.

Int. 19. Are you the same Charles McCormick Chapman who has heretofore testified for the complainant in this cause?

Ans. I am.

Int. 20. Mr Howard has testified that a loading and attaching machine, designated by him as "Model B, McKay Automatic Heel", as manufactured by the United Shoe Machinery Company, in his opinion, infringed claims 10 and 11 of patent No. 958,282, May 17, 1910, Plant. Kindly state whether you have had pointed out to you the machine referred to by Mr. Howard, and by whom pointed out, and whether you have examined the same in connection with said claims of said patent, and whether you find in such machine the mechanism defined and referred to in said claims.

Ans. I saw the machine referred to in the question at the general office of the United Shoe Machinery Company, 89 Beach Street, the machine having been shown me by Mr. Warren of that company. I made a comparison of claims 10 and 11 of the patent to

Plant No. 958,282, May 17, 1910, with the said machine, and in my opinion said claims 10 and 11 are not infringed by said machine. My opinion is based upon the fact that claim 10, among other elements, calls for "nail driving devices sustained by the cross-head", this element not being found in said machine.

As to claim 11, the element "nail drivers carried by the cross-head" is not found in said machine. Because of these two differences set up in the two claims respectively, I cannot see upon what the allegation of infringement is based.

Int. 21. Mr. Howard has testified that a certain nailing machine, designated by him as "American Lightning", in his opinion infringed claims 15 and 16 of patent to Plant No. 958,302, dated May 17, 1910. Kindly state whether this machine has been pointed out to you, whether you have examined the same and compared the mechanism with said claims 15 and 16, and whether you find the mechanism of said claims incorporated in said machine.

Ans. I examined the said machine referred to, which has thereon number 3070, at the same place, the same having been shown me by Mr. Warren, and made a comparison of the same, with claims 15 and 16 of the said patent to Plant No. 958,302, May 17, 1910. In my opinion, claims 15 and 16 of said patent are not infringed by said machine, for the following reasons: —

Claim 15 includes as an element "and a support adjacent to path and movement of said devices", which I could not find in said machines. Furthermore there is a limitation included within the clause of claim 15, "said moving parts and support having, one, a slot parallel with the apertures in said block", which limitation I was unable to find in the machine.

As to claim 16, I was unable to find in the combination of said machine "devices for operating on a heel", coupled with the further clause or element of the claim "of means for guiding said devices and apertures into alignment".

In the matter of the two above quotations the machine referred to is clearly not covered by the said claim 16 of the patent.

Int. 22. Mr. Howard has testified with reference to indenting and burnishing machine designated by him as Goodyear welt, and

that the work-supporting mechanism of that machine, in his opinion, infringed claims 1, 2 and 6 of the Plant patent to Heys No. 860,377, dated July 16, 1907. Please state whether that machine has been pointed out to you, and by whom, whether you have examined the same, have compared the mechanism with the claims in question, and what you have to say with reference to the mechanisms being the same as those referred to in the claims.

Ans. Mr. Warren showed me the machine referred to at the same place as stated by me, and I made a comparison of the structure of the same with claims 1, 2 and 6 of the said patent to Heys No. 860,377, July 16, 1907. In each of claims 1 and 2 there is a limitation in the matter of an element, "means also to tip it", this referring to the work table upon which the work is supported and in connection with which the work is fed or moved. The machine lacking this particular element of the two claims is clearly not an infringement of said claims.

With reference to claim 6 I failed to find the "means to tip it", referring to the work support, and also the element "a worm and worm wheel connections geared to rotate said table in any of its positions". Lacking these two statements of means, or rather lacking in elements answering to such statements, the claim is not infringed by said machine.

Int. 23. Mr. Howard has testified with reference to pulling-over machine, designated by him as "model B Rex", and has testified that the United Company were anxious to put out a pulling-over machine having a tip-measuring device, and that the United Company could not put out such a machine containing such device because it would infringe claim 55 of Plant patent to Heys No. 957,955, dated May 19, 1910. Kindly state whether one of the United Company's pulling-over machines was pointed out to you by anyone, and by whom, which contained in its make-up a tip-measuring device, and state whether such mechanism is that that is referred to and specified in claim 55 of the patent in question.

Ans. Mr. Warren showed me a machine allegedly the one infringing the said patent to Heys No. 957,955, May 17, 1910, in the matter of said claim 55. I compared the said claim with the

said machine and found the latter lacking in the element of the claim "and a gaging device movable into and out of operative position and co-operating with the pulling-over means to properly position the upper of the shoe".

In the machine referred to, and which I examined, there is a device which is capable of being thrown over into engagement with the shoe under-hand manipulation. There is, however, no co-operation of said device with the pulling-over means as called for by the said claim 55 of the patent. Therefore, it is my opinion that the claim is not infringed by such machine.

Int. 24. Mr. Howard has testified with reference to wheeling machine, designated by him as "No. 2, Goodyear Impression Stitch", and that the machine in question as manufactured by the United Company infringed, in his opinion, claims 2 and 5 of patent No. 784,263, dated March 7, 1905, issued to Heys, and which patent was the property of the Bresnahan Shoe Machinery Company. Kindly state whether the machine referred to was pointed out to you by anyone, whether you examined the same and compared the mechanism with the mechanism defined and referred to in the claims in question, and what you have to say with reference to the same.

Ans. The machine was shown me by Mr. Warren at the same place, and I noted thereon a name plate indicating Booth Brothers, with the number 986. I made a comparison of the claims 2 and 5 of the Heys patent No. 784,263, March 7, 1905, with the structure of said machine, and reached the conclusion, as the result of my comparison, that claims 2 and 5 of the patent are not infringed by said machine. My reason for this opinion is that the machine is lacking in the elements of claim 2, as follows: "Movable means for supporting the tool", in combination with "mechanism for automatically moving said supporting means to inactive position and operating said clutch to effect a cessation of rotation of the heel".

As to claim 5, the machine lacks the element "a movable head therefor", referring to the movable head of the patent for supporting the rotary tool. The machine also lacks the element of claim 5, "means for simultaneously unclutching the clutch mechan-

ism from the shaft to stop the rotation of said tool and moving the said head toward inoperative position".

Int. 25. Mr. Howard has testified with reference to lockstitch machine designated by him as "Model K, Goodyear Outsole Rapid", but states that that machine as put out by the United Company in 1910, in his opinion, in so far as the fudge-stitch mechanism was concerned, infringed claims 1, 2, 4, 5 and 9 of patent to Plant No. 940,723, dated November 23, 1909, and infringed claims 9 and 10 of patent to Plant No. 940,725, dated November 23, 1909. Will you kindly state whether the machine in question was pointed out to you by anyone, whether you examined the same and whether the mechanisms defined and referred to in said claims were found by you in the machine in question.

Ans. Mr. Warren showed me a machine at the same place, which he stated was lockstitch machine, model M, and on which I found the number 927 and in connection with which he alleged that all the structure allegedly infringing said two patents of the question would be found in said machine. I made a comparison of claims 1, 2, 4, 5 and 9 of patent to Plant No. 940,723, November 23, 1909, with said machine and found that the latter contained apparently all the elements called for by said claims in substantially the relation noted, and apparently for the same purpose or purposes.

It should be noted in this connection, however, that in each of the claims there is a clause, which is substantially the closing clause of each claim above referred to, calling for the movement of the slitting device to initial position to cause the said device to slit the work, this being on the return movement of the said device. From my knowledge of the art, this would seem to be the distinguishing element, if such it may be called, lending alleged patentability or patentable novelty to each of the claims. The said clause in each of the claims having reference to a mere mode of operation or particular timing of a device whereby to bring about the slitting of the work is, in my opinion, a trivial limitation and hardly important enough to impart patentable novelty to the several claims of the patent under discussion, in view of the prior art.

Regarding patent to Plant No. 940,725, November 23, 1909, I

found substantially the same condition with reference to claims 9 and 10 when compared with the structure of the said machine, and also the same condition with reference to the limitation of said claims wherein the material or work is slit or cut on return movement of the slitting knife.

Mr. PHILLIPS. All portions of the answer relating to the prior art are objected to as outside the order of the court, incompetent, irrelevant and immaterial.

[*Adjourned to 10 A. M. Friday, March 6, 1914.*]

BOSTON, MASS., March 6, 1914.

Mr. WEBSTER. The witness is submitted to opposing counsel for cross-examination, counsel for the complainant reserving the right to call the witness again with reference to matters not gone into in this examination, and counsel states that if the witness is again called the examination with reference to such other matters will be very brief.

Cross Examination by BENJAMIN PHILLIPS, Esq., *of Counsel for Defendants.*

Cross-Int. 26. Did you ever see the loading and attaching machine designated as "Model B, McKay Automatic Heel", in regard to which you testified, in operation?

Ans. If you have reference to the machine in connection with which I examined the patent to Plant No. 958,282, my answer is in the negative, with the further statement that it was not necessary to see it in operation for the purposes of claims 10 and 11 of the said patent, which I examined.

Cross-Int. 27. Will you try to confine your answers to matter responsive to my interrogatories during the rest of your examination?

Ans. I will, to the extent that such questions as you may ask will not, if answered categorically, compel me to qualify in order that my answers may be properly understood.

Cross-Int. 28. Will you please describe what you understand to be the "cross-head" in loading and attaching machine, model B, McKay automatic heel?

Ans. In the machine referred to there are two parts sliding relatively to each other, one part having sleeves at opposite ends working on rods at opposite ends of the other parts. One of these parts I took to be the cross-head since it was nearly like, and answered more nearly to, the element 5 of the Plant patent No. 958,282.

Cross-Int. 29. Did you consider that the part which carried the nail block was the cross-head of the machine referred to?

Ans. What element do you call the "nail block" in that machine?

Cross-Int. 30. The element which contains the apertures in which the nails are inserted and which the drivers enter to drive the nails.

Ans. I did.

Cross-Int. 31. Would you say that the uprights secured to each side of the part which carries the nail block were parts of the cross-head?

Ans. My recollection is that they are.

Cros-Int. 32. To what is the bottom of those uprights secured?

Ans. In the machine I examined, a heavy piece of casting extending transversely of the machine.

Cross-Int. 33. Would you say that the heavy piece of casting was part of the cross-head?

Ans. Not necessarily part of the cross-head, but a part of the cross-head frame.

Cross-Int. 34. Then you make a distinction between the cross-head and the cross-head frame?

Ans. Yes; because the cross-head must be carried by something.

Cross-Int. 35. Isn't it true that the part which carries the nail block is a heavy casting connecting the upper ends of the vertical rods to which you have referred?

Ans. According to my recollection, yes.

Cross-Int. 36. Isn't it further true that the lower heavy casting and the upper heavy casting are both actuated by the toggle at the sides of the machine to cause the compression of the heel?

Ans. Just at this moment I do not recall whether the toggle

mechanism in that machine actuated the cross-head or whether it actuated the nail drivers.

Cross-Int. 37. Was there more than one toggle mechanism in the machine, according to your vivid recollection?

Ans. There is another mechanism for actuating the other part to which I have referred, and I do not recall whether it was toggle mechanism or not.

Cross-Int. 38. In the machine which you examined did the nail-driving devices have a movement independent of the cross-head movement?

Ans. Yes.

Cross-Int. 39. By what instrumentality was that movement caused?

Ans. Either the toggle mechanism referred to by you or the other mechanism referred to by me.

Cross-Int. 40. As a matter of fact were not there two toggle mechanisms, one actuating the cross-head and the other the nail-driving device?

Ans. I have just stated my best recollection of the matters to which you referred.

Cross-Int. 41. You do not know then upon what the nail-driving device rested when in its lowermost position, do you?

Ans. No.

Cross-Int. 42. Do you know how the nail-driving mechanism was raised in so far as in its upward movement it moved with the cross-head?

Ans. No, for I did not see the machine in operation.

Cross-Int. 43. You have stated that you examined a certain nailing machine known as the American Lightning, and have compared the same with the mechanism set forth in claims 15 and 16 of patent to Plant No. 958,302. Will you examine the patent to Pope No. 1,072,986, September 9, 191°, which patent is one of the patents included in Defendants' Exhibit No. 164, and state whether or not that patent illustrates in the drawings and describes in the specification any features of the American Lightning machine examined by you?

Mr. WEBSTER. Question objected to for that it does not relate to the patent inquired about in direct examination, and for the further reason that the patent now inquired about was issued after the filing of the bill herein, and any evidence in reference thereto is therefore incompetent, inadmissible and irrelevant.

Mr. PHILLIPS. Counsel for defendants desires to state that this patent is shown to the witness for the purpose of identifying the structure in regard to which he has claimed to testify in his direct examination.

Mr. WEBSTER. Counsel for the complainant replies that counsel can hardly expect the witness to identify the structure of a machine and compare the same with such machine unless he has the machine before him at the time of examining the illustration as requested.

Ans. Without reading the specification of this patent, and upon merely cursory inspection of the drawings, I will state that in some respects the Figures 1 and 2 of said patent resemble the structure of the machine referred to in the question. That is to say, the machine examined by me and referred to in the question (if they are the same) is provided with a sliding nail driver supported upon and sliding relatively to a vertically reciprocating member or cross-head. In the rear of the cross-head of the machine I examined there is a depending spindle similar to the one indicated by "32", Fig. 1 of the patent to Pope, of the question, on which slides a lug indicated by "30" in said patent carried by the sliding nail driver. In the machine I examined, as well as in the patent to Pope of the question, the nail drivers are inclined to the vertical toward the rear of the machine and in the bed below through which the nail drivers work are a series of apertures similar to those indicated at "13" in the patent to Pope in which the nail drivers operate and which are correspondingly inclined. If the above does not satisfy the question, I will take the time to read the specification and amplify my answer.

Cross-Int. 44. Assuming the parts of the machine which you examined to be in a position such as is indicated in Fig. 1 of the drawings of the Pope patent which I just showed you, are the

drivers in or out of alignment with the apertures which you state were similar to the apertures 13 disclosed in the patent?

Ans. Presumably in alignment.

Cross-Int. 45. Will you examine the drawings a little more carefully and see if you do not desire to correct your answer?

Ans. I qualified my answer by saying "presumably in alignment", the reason for which is that the view or figure is a perspective, in consequence of which it is impossible to state that the drivers are actually in alignment with the respective apertures with which they co-operate.

Cross-Int. 46. If the drivers maintain the positions in which they are shown in said Fig. 1, I mean their lateral position with reference to the cross-head, and were moved down vertically without any lateral movement, would they register with the apertures when they came in contact with the nail block?

Ans. Under your question, obviously if the drivers came in contact with the nail block they could not register with the apertures.

Cross-Int. 47. If they were moved in vertical lines from the positions which they now occupy in Fig. 1 of the Pope patent, would such movement bring the nail drivers into engagement with the apertures in the nail block?

Ans. For the reason stated in the previous answer, compelling the qualification I made, it is impossible to answer that question in either the affirmative or the negative, owing to the fact that the view is a perspective view.

Cross-Int. 48. Didn't you observe the machine with sufficient care to answer such question with regard to the machine?

Ans. I have understood all your questions to refer to the patent to Pope, and not the machine I examined.

Cross-Int. 49. You have evidently misunderstood my questions. Referring now to the machine which you examined, and assuming that the nail drivers were in their raised positions, would a vertical movement of such drivers in a straight line cause them to engage the apertures in the nail block?

Ans. As an actual fact, under the impelling power imposed upon the machine by Mr. Warren, the nail drivers did actually descend

and enter the apertures in the bed of the machine, said apertures being similar to those indicated by "13" of the patent to Pope.

Cross-Int. 50. Did you observe the machine with sufficient care to be able to state by what mechanism the result which you have just stated was accomplished?

Ans. My recollection is that in the machine the nail drivers were maintained in a given position during the entire descent of the cross-head until the lug at the rear of the driver carrier parted from the vertical spindle. At that time the nail drivers were all in register with the apertures in the bed and descended into the respective apertures in said bed.

Cross-Int. 51. That is to say, the machine was provided with means arranged to lose control of the moving parts after the nail drivers and apertures had become engaged?

Ans. Your expression "lose control of the moving parts" is a little broad, but if you intend to confine that expression to the driver carrier, the lug, the spindle and the bed with the apertures, my answer is in the affirmative.

Cross-Int. 52. Will you kindly read upon the record that portion of the Pope specification commencing with line 107 on page 1 and ending with the end of the sentence in line 8 on page 2?

Ans. It is as follows: —

"To this end another feature of the invention consists in providing guiding means for controlling the position of the driver block and drivers upon the head when it is moved sufficiently from the work pressing members to carry the ends of the drivers out of the passages, said means being arranged to release the driver block and leave the drivers free to follow the path of the passages when the head is again moved sufficiently to enter the ends of the drivers in the passages."

Cross-Int. 53. The specification of the Pope patent further states at the bottom of the first claim on page 2, line 65: "suitable means are provided for guiding the drivers in a vertical path while they move towards or from the driver passages in order that the ends of the drivers may be properly located to enter the ends of the driver passages when the cross-head moves downwardly". Please

state whether or not you found in the machine which you examined the means referred to in the statement which I just read you.

Ans. Yes.

Cross-Int. 54. Now, assuming that the drivers have the vertical movement referred to when they are in their raised or most elevated position, are they in alignment or out of alignment with the apertures?

Ans. I should say they are in alignment with the apertures, unless some element in the machine has shifted the base in which the apertures similar to 13 are located.

Cross-Int. 55. Would you say that the two pencils which I now show you were in alignment?

Ans. In accordance with the question, you are holding two pencils inclined to the vertical, end to end, and supposedly in identically the same inclined plane. My answer is yes.

Cross-Int. 56. Now, assuming that I raise the point of one of these pencils vertically, would you say that the pencils were still in alignment?

Ans. Under the question you have shifted the pencils into parallelism.

Cross-Int. 57. Would you say they were in alignment?

Ans. No; not if they are in parallelism.

Cross-Int. 58. Now, is not that precisely what occurs in the case of the drivers and the apertures through which the drivers pass in the machine which you examined?

Ans. It may be so, and it may not be so. My recollection is that the head carrying the drivers or the plate carrying the drivers similar to the one with the lug 30 thereon in the Pope patent, while capable of movement relatively to the bed, with the apertures 13 therein in the Pope patent did not move relatively to said bed.

Cross-Int. 59. Isn't it true that the lower ends of the drivers were moved in a vertical line from the upper end of the apertures in the upward movement of the cross-head?

Ans. Yes.

Cross-Int. 60. How could that be done without moving the aper-

tures and drivers out of alignment, assuming that the nail block remained stationary?

Ans. In the first place, the entire movement, as I observed it in the machine under discussion, of the driver and its head was vertical, and no change whatever took place between the relation of the drivers and the apertures in the bed under the vertical movement.

Cross-Int. 61. Isn't it true that the lower ends of the drivers moved upward in a vertical line after they were disengaged from the apertures?

Ans. Yes.

Cross-Int. 62. How could that movement take place without throwing the drivers and apertures out of alignment?

Ans. By maintaining the same relation between the drivers and the bed with the apertures therein; that is, by avoiding any shift laterally of either of the parts.

Cross-Int. 63. Could the points or lower ends of the driver move in that way and avoid a lateral movement of the drivers with reference to the apertures?

Ans. Yes; provided the guiding devices were maintained in co-operative relation until the pins or drivers were caused to register with the apertures.

Cross-Int. 64. You do not dispute, do you, that the lower ends of the drivers during the upward movement of the cross-head move in vertical lines?

Ans. No.

Cross-Int. 65. It is true, then, is it not, that every point on every driver moves along a vertical line?

Ans. Yes.

Cross-Int. 66. If that is true, how can such vertical movement be accomplished without throwing the drivers and the apertures out of alignment?

Ans. The points of the drivers might move through a myriad of different planes and yet maintain the aligned relation of the pins with the apertures in the bed, under the proper operation of the machine.

Cross-Int. 67. I will put my question a little differently. It is true, is it not, that if the drivers were in alignment with the apertures when the cross-head was in its raised position, that a movement of the drivers in the direction of their longitudinal axis would cause them to register with and pass through the apertures?

Ans. Of course the question is purely suppositional, but if I understand the meaning of it my answer is in the affirmative. I can see, however, that counsel and I have been working at cross purposes in connection with the machine and the structure thereof in question, and in order to place counsel on the same plane with me in the matter of my answers I will suggest the following: at times the questions have referred to the points of the drivers with reference to the apertures; at times with reference to the entire length of each driver or considering the drivers as a whole and not merely their points, and at times with reference to the alignment of the drivers and the apertures, the latter may be, or may be not, being considered in their entirety.

Now, with reference to these differences, and as I have caught the meaning of the questions, I will state that both in the machine I examined as well as the patent it is quite obvious that when the driver carrier is raised so that the guiding devices co-operate to control the carrier, the drivers are bodily moved in a vertical plane, and throughout their length are not in alignment obviously with the entire length of the apertures, considered as passages through the base. The drivers, however, in any position which they might assume with reference to the base, are necessarily in alignment with the apertures considered merely as holes at or around the surface of the base. Possibly that explanation will place counsel and the witness on the same basis of understanding.

Cross-Int. 68. In view of your present understanding, just what is meant, according to your interpretation, in claim 15 where it is stated that "one, a slot parallel with the apertures in the block"? I am referring to patent to Plant No. 958,302.

Ans. The apertures referred to in the matter quoted from claim 15 of said Plant patent means the entire passage or passages such as are indicated by "13" in the base of the Pope patent, the pas-

sages being of considerable length. This is also true in the machine I examined, that is, the apertures are of considerable length, and are passages into which the drivers pass and in which they operate. The slot referred to in claim 15 of the patent to Plant is the slot "104", shown clearly in each of Figures 13 and 14 of the Plant patent, sheet 10 of the drawings. In the Plant patent referred to the slot "104" in the upright of the member "52" which co-operates with the pin apparently carrying an anti-frictional roller "106" is parallel with the passages or apertures in which the drivers and cutters or punchers operate, the said passages or apertures being in the member "44" in the same figures of the Plant patent. The corresponding passages or apertures in the Pope patent are inclined to the vertical and are consequently at an angle, not only to the passage or aperture in the lug "30" but also to the pin "32", which co-operates with said lug.

Cross-Int. 69. Do you give the word "apertures" as used in claim 16 of the same Plant patent No. 958,302 a different meaning?

Ans. No.

Cross-Int. 70. What element was it which, in your opinion, was included in the description of claim 16 which is not found in the machine which you examined? I am referring to the nailing machine, American Lightning.

Ans. The element included within the expression "with devices for operating on a heel", coupled with the element included within the clause "of means for guiding said devices and apertures into alignment".

Cross-Int. 71. Wouldn't you call the drivers in the American Lightning machine devices for operating on a heel?

Ans. Yes; but not within the terms of this claim of the Plant patent, that is, claim 16.

Cross-Int. 72. Isn't it true that the Plant specification refers both to awls and drivers?

Ans. Yes; and the said sixteenth claim includes them both.

Cross-Int. 73. Under what expression?

Ans. In the expression "with devices for operating on a heel".

Cross-Int. 74. In the Plant machine does the guiding means,

that is, the slot and the roll, act in connection with more than one set of devices at a time?

Ans. No.

Cross-Int. 75. And when one set of devices is in operation the other is absolutely inoperative?

Ans. Not inoperative, but out of operative position.

Cross-Int. 76. It is performing no operation?

Ans. Correct, as just stated.

Cross-Int. 77. And in so far as the action of the slot and roll is concerned when operating in connection with the drivers, in so far as its operation is concerned the awls might as well be off the machine?

Ans. Why, no; certainly not. You are assuming an inoperative machine in contradistinction to an operative machine including devices which are at all times capable of operation and performing a function when brought into the proper relation with other devices in the machine.

Cross-Int. 78. What effect, if any, upon the operation of a slot and roll in the machine of the Plant patent, when acting as a guide for the nailing devices, does the existence of the puncturing awl on a machine have?

Ans. None.

Cross-Int. 79. It is true, is it not, in the Plant machine that the slot which acts as a guiding slot is a vertical slot?

Ans. I assume you refer to the slot "104" in Figures 13 and 14. My answer, therefore, is yes.

Cross-Int. 80. It is true, is it not, they are parallel to the apertures simply because the apertures are vertical?

Ans. That may be a condition, but I could not say that it is "simply because", since, as I understand the Plant machine and the idea of invention thereof, the arrangement of the apertures or passages for the drivers and awls parallel with the slot "104" was intentional and not merely because.

Cross-Int. 81. Isn't it true in the Plant machine that when the drivers have registered and engaged with the apertures in the nail block the roll "106" passes out of the slot "104", so that the

motion of the drivers is no longer controlled by the slot, and it is absolutely immaterial whether the slot is parallel with the drivers or not, provided it is suitably shaped and in a suitable position on the machine to guide the drivers into engagement with the apertures?

Ans. The condition suggested by the question is undoubtedly true. The supposition of the question being merely a reference more to the idea of the inventor, I cannot answer.

Cross-Int. 82. Isn't it true that both the vertical slot "104" in the Plant machine and the vertical rod in the nailing machine, American Lightning, act to guide the drivers in their downward movement and to cause them to engage the apertures in the nailing block?

Ans. Yes

Cross-Int. 83. Isn't it true of both devices that when the drivers are thus engaged they are released from the guiding devices and left to move free from the control thereof?

Ans. Yes.

Cross-Int. 84. Isn't it true that the vertical pin which is referred at "32" in Pope patent No. 1,072,986 is adjacent to the path of movement of the drivers?

Ans. Oh, yes; it may be so considered.

Cross-Int. 85. Referring now to wheeling machine No. 2, Goodyear impression stitch, with regard to which you have testified, did you examine that machine with sufficient care to be able to state whether or not it comprised a rotary tool?

Ans. Yes; I found it to contain a rotary tool.

Cross-Int. 86. Did the machine last referred to, as far as you are able to state, also comprise a shaft connected with the rotary tool and having a clutch mechanism thereon?

Ans. I think so.

Cross-Int. 87. Is it not further true that said machine comprises means for relatively moving the tool and the work support so that the tool is out of operative engagement with the work?

Ans. Not precisely as stated by the question. I found in the machine a work support which could be depressed relatively to the

operative position of the tool. The result of that condition in the machine is that when the work support is depressed relatively to the tool the work may be taken away from the action of the tool. You will note that this is not precisely in the language of the question, the latter stating it in such a way that I was compelled to qualify.

Cross-Int. 88. Is it not true that when the work support has been depressed to permit removal of the work, as you have stated, that the tool is out of operative engagement with the work?

Ans. Not necessarily; you may depress the work support and still hold the work in engagement with the tool.

Cross-Int. 89. But it is true, is it not, that if the work continued to rest upon the work support, the work support may be depressed so that the tool is out of working engagement with the work?

Ans. It is.

Cross-Int. 90. Isn't it also true that in the machine of the Heys patent No. 784,263, if the operator continues to hold the work against the tool when the tool is raised, it will not be out of working engagement with the work?

Ans. Yes, and no. Physically the shoe would be in engagement with the tool when the latter is elevated. Considering it from an operative or operating standpoint, when the tool is lifted it goes out of action, since the clutch mechanism is thrown out of action. Hence we may consider the shoe as not in operative engagement with the tool.

Cross-Int. 91. Isn't it true of wheeling machine No. 2, Goodyear impression stitch, that it comprises means for simultaneously unclutching the clutch mechanism of the shaft to stop the rotation of the tool and relatively move the tool and work support so that the tool is out of operative engagement with the work?

Ans. I would say may be out of engagement with the work, and with the qualification of my foregoing answer, my answer to the last question is yes.

Cross-Int. 92. Your theory is, as I understand it, in wheeling machine No. 2, Goodyear impression stitch, the work might be held by the operator against the tool after the work support had

been depressed. Isn't it true, however, that the tool at this time would not be in rotation, so that while there might be physical contact between the work and tool, the tool could not be said to be in operative engagement with the work?

Ans. Correct.

Cross-Int. 93. Referring now to indenting and burnishing machine, Goodyear welt, did you examine that machine with sufficient care to state whether or not it comprised a tool for acting upon the sole of a shoe?

Ans. Yes; I did.

Cross-Int. 94. Did it?

Ans. It did.

Cross-Int. 95. Did it also comprise a work table for supporting and moving the work?

Ans. Yes.

Cross-Int. 96. Did it also comprise worm and worm wheel connections geared to and to rotate said table in any of its positions?

Ans. No.

Cross-Int. 97. What mechanism referred to in my last question did it lack?

Ans. All the mechanism stated by the question.

Cross-Int. 98. That is, you mean the gear and the gear wheel connection?

Ans. No; I mean the worm and worm wheel connection as stated by your question.

Cross-Int. 99. Are you sure that you examined the machine with sufficient care to answer that question?

Ans. I think so.

Cross-Int. 100. And you feel as positive in this matter as you do with regard to your other statements which you have made as to machines which you examined?

Ans. Yes.

Cross-Int. 101. Will you please describe the mechanism by means of which the table was rotated?

Ans. Ordinary driving gear; that is, a gear wheel arranged in a horizontal plane with its teeth in a vertical plane, co-operating with

a gear on the table or support arranged at an inclination to the first named gear; this in contradistinction to the mechanism referred to in your question, viz., worm and worm wheel connection, etc.

Cross-Int. 102. Isn't it true that in the machine of the Heys patent the table is rotated by means of a bevel gear, arranged in substantially horizontal position, which meshes with another bevel gear arranged in a vertical position, which in turn meshes with a bevel gear on the lower portion of the work table?

Mr. WEBSTER. Objected to for that it calls for matter foreign to the direct examination.

Mr. PHILLIPS. Counsel for defendants calls attention to the fact that this witness has assumed to understand a machine of the Heys patent No. 860,377 sufficiently to express an opinion on the question of infringement of certain of its claims.

Mr. WEBSTER. The attention of the Court is respectfully called to the fact that the question here at issue is with reference to a comparison of certain claims with a certain machine and not with reference to the whole Heys patent.

Mr. PHILLIPS. It is evident from this expert's testimony that he seems to have considered the claim without reference to the patent, if that is what is meant by my brother Webster.

Ans. Yes, that is true; but I direct attention to the fact that the teeth of the several gears vary in depth.

Cross-Int. 103. Which one of those gears would you call a worm?

Ans. Neither of them.

Cross-Int. 104. Isn't it true that means are provided in the indenting and burnishing machine, Goodyear welt, whereby it is possible to tip the table into any desired angular or oblique position at any level without in any manner disturbing the driving connections to rotate it?

Ans. The machine I examined has co-operating parts such that the table may be tilted to any desired position, within limits, relatively to the rotary tool, but such means of co-operating parts are what may be called "set" means; that is, a bolt in one part working through a slot in another, the bolt being capable of being loos-

ened and tightened for the purpose of shifting the table. This, however, is not the means referred to in claims 1, 2 and 6 of the Heys patent No. 860,377, and embraced within the terms "means also to tip it", claim 1, "means to tip it", claim 2, and a similar clause in claim 6.

Mr. PHILLIPS. Answer objected to as utterly irresponsive after the words "This, however, is not the means referred to".

Cross-Int. 105. Isn't it true that the machine of the Heys patent is provided with what you have chosen to term "set" means for tilting the table into any desired position, within limits?

Mr. WEBSTER. Objected to for that the inquiry goes to the machine of the Heys patent, while the direct examination went only to a comparison of claims 1, 2 and 6 of that patent with the machine examined by the witness.

Ans. Yes, and also with the other means referred to in the several claims above referred to in the clauses quoted by me therefrom.

Cross-Int. 106. The means to which you have referred in your last answer, aside from what you have termed the "set" means, for adjusting the angularity of the table, are the treadle and connections between the treadle and the table which simultaneously change its elevation and the pitch of the table, are they?

Ans. Yes, and includin the set means.

Cross-Int. 107. Means to which I referred in my last question are the means stated in claim 2 of the Heys patent No. 860,377, are they?

Ans. Yes; as I understand it, it is the mechanism or devices by means of which the table may be tilted relatively to the tool at the same time that it is elevated or depressed relatively to the tool.

Cross-Int. 108. For the information of the Court will you kindly read claim 2 upon the record?

Ans. It is as follows: —

"[2] In a machine of the class described, the combination with a working tool, of a work table for moving the work with relation to said table and the tool, means to raise and lower the table, means to tip it, and means to rotate it in any elevated or tipped position."

Cross-Int. 109. Will you kindly read upon the record claim 3 of the Heys patent?

Mr. WEBSTER. Objected to for that claim 3, or the structure referred to therein, is not involved in this inquiry and no reference was made to the same on direct examination.

Ans. It is as follows: —

"[3] In a machine of the class described, the combination with a working tool for acting upon the sole of a shoe, of a work table for supporting the work for the action of said tool, a treadle and connections between said treadle and table for simultaneously changing the elevation and pitch of the table."

Cross-Int. 110. Do you find in either claim 1 or claim 2 any express limitation as to any simultaneous change of the elevation and pitch of the table?

Ans. Just what you mean by "express limitation" I do not now grasp. An express limitation may be by words in the claim, or by necessity of the prior art, in view of which the claim was written, amended or changed, or in view of which it was originally written. Therefore I am compelled to ask what you mean by the expression in your question which I have quoted above.

Cross-Int. 111. Do you find in claim 1 or 2 any language requiring the simultaneous change in the elevation and pitch of the table?

Ans. My answer must be the same as the last, for the reasons stated.

Cross-Int. 112. What language do you find in either claim 1 or 2 which refers to any simultaneous change in the pitch or elevation of the table?

Ans. As I have before stated in answer to the last two preceding questions, the question as to whether there is a limitation to a structure within the meaning of the word "simultaneous" of the question, depends entirely upon the prior art and other conditions stated by me, and in this connection I may state that I have not considered the prior art nor the history of the claims referred to, nor any of the reasons leading up to the use of the language of the two particular claims mentioned. I am, therefore, not able to answer the question in the precise way in which it is asked.

Cross-Int. 113. I was not inquiring about the prior art; I was asking you concerning the language of the claim as stated in the patent as a matter of mechanical definition.

Ans. I so understood the question and my answer now is identically the same as before, for all the reasons stated. And I might add that "mechanical definition" of any of the elements of the claims must necessarily be dependent upon standards and conditions in view of which the words were used, or the terms were employed, in defining the invention of the patent.

Cross-Int. 114. Prior to your direct examination had you read the specification of the Heys patent No. 860,377?

Ans. Partially.

Cross-Int. 115. Then, as I understood you, your construction of the claim in regard to which you testified was not based on the prior art and was given after only a partial reading of the specification; is that correct?

Ans. Yes; with this qualification, that by "partial" I mean in contradistinction to studying it in the way that I would with file-wrapper and contents in view, prior art, etc.

Cross-Int. 116. Prior to your giving your testimony in this case just what portion of the Heys specification in patent No. 860,377 had you read?

Ans. I may say that I skimmed hurriedly over the entire specification, but particularly I read portions beginning with line 105, page 1, down through the paragraph ending on line 34, page 2, and those portions on page 3 beginning line 74 and ending with line 100.

Cross-Int. 117. Now, will you kindly read upon the record the portion following line 34 on page 2, at which you say you stopped carefully reading the Heys specification? I refer to matter from lines 35 to 41, inclusive.

Ans. It is as follows: —

"Not only is the driving engagement with and to rotate the table maintained in all vertical positions of the table, but because the said table is tipped about the axis of the double bevel-gear *c* (see Fig. 2 and 3), it is possible to tip the table into any desired

angular or oblique position, at any level, without in any manner disturbing the driving connections for rotating it."

Cross-Int. 118. Isn't it true that to bring the table into any desired angular or oblique position at any level it is necessary to make use of what you have called the set tipping means disclosed in the Heys patent?

Ans. Why, yes, in the sense that said means in accordance with the Heys construction is manipulated to first give the supporting table a^5 a predetermined arrangement relatively to the rotating tool indicated at *e*, Fig. 3. This done, manipulation of the treadle a^{10} to which is connected two rods a^9 and b^1, will bring about the double function referred to in the several claims to which I have particularly referred.

Cross-Int. 119. Do you find in any portion of the specification of the Heys patent any reference to varying the pitch of the work-supporting table?

Ans. Yes.

Cross-Int. 120. In what part of the specifications?

Ans. In the part beginning line 105, page 1, and ending line 3, page 2; and also in the matter beginning line 76, page 3.

Cross-Int. 121. In the machine which you examined, to wit, indenting and burnishing machine, Goodyear welt, is any means provided for changing the elevation of the table or work support?

Ans. Yes, as heretofore stated by me in answer to previous questions.

Cross-Int. 122. How is such change in elevation accomplished?

Ans. Through the medium of a treadle, connecting rod and connection of the latter with the table.

Cross-Int. 123. Is the table mounted upon a swinging lever?

Ans. As I remember it, yes.

Cross-Int. 124. Is the arrangement of gearing such that in any position to which the table is swung by the action of the swinging lever the driving mechanism is still effective to rotate the table?

Ans. Within the limits of that machine as I saw it operated, yes.

Cross-Int. 125. Do you find any reference in either claims 1, 2

or 6 of patent to Heys No. 860,377 to any mechanism for changing the pitch of the table; I mean in direct language?

Ans. Yes; in the means which I have heretofore quoted from each of said claims.

Cross-Int. 126. Of course you do not find the word "pitch" used in either of the claims referred to?

Ans. Why, no.

Cross-Int. 127. And it is a matter of opinion on your part, is it, that the word "tip" and changing the pitch are used synonymously?

Ans. In the Heys specification and claims; yes.

Cross-Int. 128. In claim 3 where the treadle mechanism is referred to it is true, is it not, that the language employed to designate the angular movement of the table is "changing the pitch of the table", while in claims 1, 2 and 6, which make no direct mention of the treadle mechanism, the means for changing the angular position of the table are described as "means also to tip it"?

Ans. In the first place, if you intended to quote from claim 3, or if you intended your quotation above to be from claim 3, it is inaccurate, no such expression or language as that quoted by you appearing in the claim. The language is, if you had reference to claim 3, "a treadle and connections between said treadle and table for simultaneously changing the elevation and pitch of the table".

Now, answering the question, the means for changing the angular position of the table, which is your language, or substantially your language, necessarily includes the combination of devices and elements beginning with lever a^{10} and extending to rods a^{9} and b^{1} and connections of said rods at their upper ends with the said table. In the operation of the Heys machine of the said patent 860,377 the angular position of the table is brought about, as well as changes in that position, by the connections just described.

In the static condition of the machine the angular position of the table and changes in that angular position are brought about by the means which I have stated as set means, through the medium

of which the lever a^4 of the patent may change the position of said table indicated as a^5. Hence in claims 1 and 2, in order to give any meaning to the language thereof, "means also to tip it" and "means to tip it" necessarily have reference to the combined mechanisms and their combined effect to which I have just referred. Of course I appreciate the fact that by dissecting either of these claims, as well claim 3 or even claim 6, it may be possible to cause the language thereof as expressing individual mechanisms or devices to apply to most anything and be wholly senseless in the claims in so far as the structure of the patent is concerned and the true intendment of the language or above claims and specification.

Cross-Int. 129. Then, as I understand your testimony, you would deem it a senseless construction of a claim if the claim was construed to cover mechanisms specifically disclosed in the drawings and pointed out and described in the specification of a patent, without also including all the other mechanisms shown and described in said patent?

Ans. Oh, no; you have inverted my meaning. What I said was, and the meaning which I intended to convey is, that in construing the particular expressions of the claim they must be given meaning with reference to the specification and the particular cooperation of the part stated for the purposes of the machine structure covered by the patent.

Cross-Int. 130. Isn't it one of the purposes of the machine structure covered by the patent to provide means whereby it is possible to tip the table into any desired angular or oblique position at any level without in any manner disturbing the driving connections for rotating it?

Ans. Surely, if you understand the word "disturbing" of your question to mean changing the driving relations of the parts.

Cross-Int. 131. What do you understand it to mean in view of the Heys specification?

Ans. What I stated in the last past of my last answer.

Cross-Int. 132. Referring to pulling-over machine, model B, Rex, with regard to which you testified, did you examine it with

sufficient c[illegible] to be able to identify any of its features in the drawings and specification of United States Letters Patent?

Ans. Assuming that your question is directed to a patent which possibly illustrates the particular machine shown me by Mr. Warren, I will say that in so far as I examined that machine I believe I would be able to identify like parts in any patent allegedly covering the same.

Cross-Int. 133. To what features in the machine was your attention particularly directed when you examined the same with Mr. Warren?

Ans. Shoe-supporting means, pulling-over means arranged at the side and toe of the shoe, and a hand-operated gaging means capable of movement independently of, but relatively to, the pulling-over means and the shoe-supporting means.

Cross-Int. 134. What do you mean by "gaging means"; means for gaging what?

Ans. I mean the device which I found in that machine consisting of a pivoted, bent lever, having in one end an aperture through which had been thrust a nail. The apparent function of the device is, as I understood the machine, to enable the operative to determine whether the upper is properly positioned on the last and maintains that proper position during the operation of the pulling-over means.

Cross-Int. 135. Had you read, prior to your direct testimony in this case, specification of Letters Patent to Heys No. 957,955?

Ans. Yes.

Cross-Int. 136. Will you please examine the United States Letters Patent granted to the United Shoe Machinery Company on the application of O. Ashton, No. 1,030,763, and state whether or not it illustrates in the drawings and describes in the specifications any features of the pulling-over machine examined by you and in regard to which you testified in your direct examination?

Mr. WEBSTER. Objected to as outside the scope of proper cross-examination, nothing of this kind having been referred to in the direct examination.

Ans. I do not recognize in the patent anything of the construc-

tion of the machine which I examined as stated by me in my direct examination.

Mr. PHILLIPS. The Patent Office copy of the Ashton patent No. 1,030,763, June 25, 1912, is offered in evidence.

[*Patent Office copy of Ashton patent No. 1,030,763, June 25, 1912, is marked "Defendants' Exhibit 351, Ashton Patent".*]

Mr. WEBSTER. The introduction of the exhibit is objected to as incompetent, inadmissible and irrelevant, both on the grounds that it has no relation to the matter inquired about on direct examination and for the further reason that it is a copy of a patent issued after the filing of the bill herein.

Cross-Int. 137. Will you please describe the gauging device of the Heys patent and the means of moving it into and out of operative position?

Ans. You mean the Heys device of patent No. 957,955, granted May 17, 1910?

Cross-Int. 138. Yes.

Ans. I believe it is fair to assume that the description of the Heys patent referred to by you of the gauge and means for operating the same is correct, and I therefore refer you to the said description. If, however, there is anything in the description or in the illustration of the Heys patent which strikes you as being obstruse, I will be glad to attempt to explain it.

Cross-Int. 139. Will you kindly describe in your own language, as you understand it from your study of the patent, the operation of the gauging device of the Heys patent and the means for moving it into and out of operative position?

Ans. Referring to Fig. 1 of the drawings of the Heys patent No. 957,955, the numeral 106 refers to a frame portion of the machine at the top of which is pivoted a member carrying a rod 109, the latter being adjustable in said member by means of thumb nut 111. The forward end of the rod, or more properly the lower end of the rod, which co-operates with the upper on the shoe is downly bent and is provided with an anti-frictional ball. A spring 113 tends to normally depress the gauging end of the rod 109, and an arm 112 connected by rod or link 114 is operated to manipulate the

rod 109 through the medium of cam 116 on lever 104 journaled at 92. The foregoing briefly is the construction referred to in the question, detailed description of which will be found in the specification of the Heys patent in the second column of page 5.

Cross-Int. 140. Please describe how, by means of mechanism which you have just referred to, the gauge 110 on the rod 109 is thrown into and out of operative position.

Ans. Normally the gauge rod 109 is elevated through the medium of the weight of the rod 114 connected to the arm 112 of the member 108 and, in the language of the specification in column on page 5 referred to by me, when the operative depresses the handle 104 to push the last back into the heel portion of the upper the cam 116 of the hub of said handle lever is turned upward and acts upon the roller stud 115 to lift the rod 114, and through the spring 113 throw the tip gauge downward into yielding contact with the upper and in full view of the operative looking down upon the shoe from above.

Cross-Int. 141. What is the function of the gauge 110 in the machine illustrated and described in Letters Patent to Heys No. 957,955?

Ans. Primarily to enable the operative to cause the tips of the uppers as stretched upon the last to be uniform in position on the last throughout any number of uppers and tips so placed; that is, to bring about uniformity of product of the machine with reference to a given style of shoe.

Mr. PHILLIPS. Cross-examination closed.

Direct Examination resumed by Mr. WEBSTER.

Int. 142. State whether or not the cross-examination has brought to your attention anything which leads you to change your opinion as expressed in your direct examination.

Ans. It has not.

Mr. WEBSTER. Redirect examination closed.

[*Signature waived.*]

Attest: CHARLES K. DARLING, *Special Examiner.*

Adjourned subject to call.

BOSTON, MASS., March 16, 1914.

Mr. WEBSTER. It having been heretofore stipulated and agreed by and between counsel for the respective parties, and to accommodate counsel for both parties, that the introduction of the following exhibits might be delayed until the coming in for the purpose of taking evidence in surrebuttal, therefore the complainant now offers in evidence a certified copy of the file-wrapper and contents in the matter of Letters Patent to Thomas G. Plant, dated January 28, 1908, No. 877,858, entitled "Improvement in Welt and Thread Cutting Means for Sewing Machines", and the same is marked "Plaintiff's Exhibit 287".

[*The complainant also offers in evidence printed Patent Office copies of the patents referred to in said file-wrapper, the same being:*

Patent to Coombs, stay-cutting attachment for sewing machines, dated July 28, 1891, No. 456,692;

Patent to Marsh, stay-cutting attachment for sewing machines, dated March 7, 1905, No. 784,220;

Patent to Harris, inseam trimming machine, dated March 30, 1897, No. 579,751;

Patent to Arnold, attachment for applying welts or rands, dated December 24, 1901, No. 689,532;

Patent to Roberts, thread holder and cutter for buttonhole sewing machines, dated August 12, 1890, No. 434,181;

Patent to Hawes, thread-trimming device for sewing machines, dated May 10, 1898, No. 603,688;

Patent to Allen, thread-cutting device for sewing machines, dated January 5, 1904, No. 749,012;

Patent to Folson, sewing machine, dated May 24, 1864, No. 42,846,

which patents are marked "Plaintiff's Exhibit 288".

It is agreed that said file-wrapper and patents now introduced may have the same force and effect in all respects as if introduced during the time assigned in the order of the court under which this testimony is being taken, and is subject to the following objection by

the defendant: that the introduction of said exhibit is unauthorized by and outside the order of the court under which this testimony is being taken, and that all of said exhibits are incompetent, irrelevant and immaterial.

Counsel for complainant states that he has no further evidence to offer in rebuttal.]

ADDITIONAL EVIDENCE FOR DEFENDANTS.

TAKEN PURSUANT TO ORDER OF COURT, ENTERED FEBRUARY 10, 1914, BEFORE ME,

CHARLES K. DARLING,
Special Examiner.

BOSTON, MASS., March 16, 1914.

Present:

ALLEN WEBSTER, Esq., *Special Assistant to the Attorney General,*
WILLIAM S. GREGG, Esq., *Assistant to the Attorney General, of Counsel for Complainant;*
FREDERICK P. FISH, Esq., and BENJAMIN PHILLIPS, Esq., *of Counsel for Defendants.*

DEPOSITION OF ARTHUR S. BROWNE.

Direct Examination by BENJAMIN PHILLIPS, Esq., *of Counsel for Defendants.*

Int. 1. Please state your name, residence, occupation and what experience you have had which enables you to testify as an expert in this case.

Ans. Arthur S. Browne; Chevy Chase, Maryland; occupation, patent solicitor and expert. I was graduated from Dartmouth College in 1881, and have been actively and continuously engaged in my present profession for the past thirty-two years. I have had a great deal to do with shoe machinery for twenty-five years last past. My experience has been in examining machines of this character, in preparing and prosecuting applications for patents on such machines, in studying patents in regard thereto, and testifying in patent suits on patents involving such machines.

Int. 2. Have you read the direct and cross-examination of Mr. Charles McCormick Chapman, a witness produced in behalf of the petitioner, in rebuttal, under the order of the court under which this testimony is being taken?

Ans. Yes.

Int. 3. Have you read and do you understand the several Letters Patent of the United States referred to by Mr. Chapman in his said testimony?

Ans. Yes.

Int. 4. Mr. Chapman has testified in regard to pulling-over machine, model B, Rex, which he states that he examined and compared with claim 55 of Heys patent No. 957,955, May 17, 1910, that such machine did not, in his opinion, infringe said claim 55. Please state whether or not you agree with Mr. Chapman; if not, whether you find in pulling-over machine, model B, Rex, the devices set forth in said claim 55, and if you do, state what errors, in your opinion, led to Mr. Chapman's stated conclusions as to infringement.

Ans. I have examined pulling-over machine, model B, Rex, which I will refer to as "model B Rex machine". I do not agree with Mr. Chapman.

Mr. Chapman when he testified evidently had forgotten the construction of the model B Rex machine. In answer to one of the cross-questions, he identified this machine by stating that it had "a pivoted, bent lever, having in one end an aperture through which had been thrust a nail". This is not true of the model B Rex machine.

In order to illustrate the exact construction of the model B Rex machine in this respect, I here produce two photographs of it. One of these photographs shows a shoe in position in the machine, and the other photograph shows the machine with no shoe in it.

[*Photograph of pulling-over machine, model B, Rex, with shoe in, is marked "Defendants' Exhibit 352".*

Photograph of pulling-over machine, model B, Rex, without shoe in, is marked "Defendants' Exhibit 353".]

I have indicated in these photographs the tip-gaging device by the letter "A". Manifestly, this tip-gaging device bears no resemblance to a bent nail.

In further illustration of this model B Rex machine, I refer to the Ashton United States patent No. 1,030,763, June 25, 1912,

which is Defendants' Exhibit 351. This patent illustrates several forms of tip-gaging devices. The form illustrated in Fig. 2 of the drawings of this patent is substantially like the tip-gaging device of the model B Rex machine. The tip-gaging device itself is shown at 16 in Fig. 2 of this patent.

As I understand Mr. Chapman's evidence, he does not dispute the presence of the several elements of claim 55 of the Heys patent No. 957,955 in the model B Rex machine, but his contention is that there is no "co-operation of said device" (namely, the tip-gaging device) "with the pulling-over means as called for by the said claim 55 of the patent".

In this Mr. Chapman is in error, because in the model B Rex machine there is exactly the same co-operation between the tip-gaging device and the pulling-over means as there is between the corresponding characteristics of the machine of the Heys patent No. 957,955.

The purpose of the machine of the Heys patent No. 957,955 is to pull the upper tightly over the shoe last preparatory to securing the upper to the last so that the upper will be in proper condition for the subsequent operations of securing the upper to the sole of the shoe. It is highly important that the upper should be exactly fitted to the last and in proper relation thereto.

The object of the tip-gaging device shown at 110 in various figures of the drawings of the Heys patent No. 957,955, such as Figs. 1 and 3, is to afford a guide to enable the operator to so adjust the shoe upper to the last that he knows that it is in just the right relation.

The tip-gaging device of model B Rex machine has exactly the same function and office.

In both machines, after the shoe has been placed in the machine the workman swings the tip-gaging device into position over the forepart of the shoe. If the tip-gaging device then registers accurately with the tip seam of the shoe, the operator knows that the shoe upper is properly related to the last.

If this proper relation does not exist, then in both machines the workman makes the proper manipulation to secure relative move-

ment between the last and the upper so that the tip gauge will register with the tip seam of the shoe upper.

In both machines this adjustment which is determined by the tip-gaging device puts the shoe upper in the proper position for the further action of the pulling-over means.

Accordingly, there is exactly the same co-operation in the two machines between the tip-gaging device and the pulling-over means. In both machines there is a true co-operation between those instrumentalities because the proper action of the pulling-over means is determined by the tip-gaging device.

Accordingly, I do not agree with Mr. Chapman. The entire subject-matter of claim 55 of the Heys patent No. 957,955 is present in the pulling-over machine, model B, Rex.

Int. 5. Mr. Chapman also referred to indenting and burnishing machine, Goodyear welt, which he said he compared with claims 1, 2 and 6 of patent to Heys No. 860,377, June 16, 1907, and that, in his opinion, said machine did not infringe said claims. State whether or not you have examined this machine, and, if you have, state whether you agree with Mr. Chapman as to his conclusion as to infringement, and, if not, state whether or not you find in such machine the mechanism set forth in said claims and point out, in your opinion, what are the errors which led Mr. Chapman to the conclusions as to the infringement which he stated.

Ans. I have examined this indenting and burnishing machine, Goodyear welt, which I will hereafter refer to as indenting and burnishing machine. I do not agree with Mr. Chapman.

The purpose of the Heys patent No. 860,377 is to make indentations in the upper surface of the projecting edge of the shoe. The work is done by the co-operation of an indenting and burnishing tool shown at *e* in the drawings of the Heys patent and a work table a^5. When the shoe is being acted upon the sole rests on the work table and the projecting edge extends below the indenting and burnishing tool *e*. This work table is rotated by suitable driving gear so that it acts to feed the shoe along during the indenting and burnishing operation.

Mr. Chapman gives one reason which, in his opinion, excludes

indenting and burnishing machine from each of claims 1, 2 and 6 of the Heys patent No. 860,377, and he gives a second reason why, in his opinion, the indenting and burnishing machine does not have the subject-matter of claim 6 of said patent.

I will take up this second reason first. With respect to the second reason given by Mr. Chapman, he is in error as to the construction and mode of operation of the indenting and burnishing machine.

Mr. Chapman says that this indenting and burnishing machine lacks "a worm and worm wheel connections geared to, and to rotate, the said table in any of its positions" as defined in claim 6.

The worm and worm wheel thus defined in claim 6 are shown at c^4 and c^3 in Figures 1 and 2 of the drawings of the Heys patent No. 860,377.

The indenting and burnishing machine has a similar worm and worm wheel, which Mr. Chapman evidently overlooked in his examination of this machine.

In order to illustrate the indenting and burnishing machine I here produce drawings thereof, comprising two sheets.

[*Drawings, in two sheets, of indenting and burnishing machine, Goodyear welt, are marked "Defendants' Exhibit 354".*]

As shown in these drawings, 10 is the rotary work table. It receives its rotation from a power shaft 5. This power shaft carries a worm 20, shown in Fig. 2, and this worm co-operates with a worm wheel A shown in Fig. 3. Accordingly, indenting and burnishing machine has "a worm wheel connection geared to rotate said table in any of its positions", as called for by claim 6 of the Heys patent 860,377. Indeed, the driving gearing for the work table in the indenting and burnishing machine is substantially identical with that of the Heys patent.

Heys has the main shaft c^5, the worm c^4, the worm wheel c^3, the pinion c^1 (see Fig. 7), the double-tooth pinion c, gear teeth on the work table a^3, together with the shafts and spindles therefor. Similarly the indenting and burnishing machine has the main shaft 5, the worm 20, the worm wheel A, the pinion 18, the double-tooth

pinion 17, 15, the gear teeth 14 on the work table, and the shafts and spindles carrying said gears.

Mr. Chapman's other reason is applicable to each of claims 1, 2 and 6 of the Heys patent No. 860,377. Each of these three claims recites "means to tip" the work table, and Mr. Chapman denies that this feature is present in the indenting and burnishing machine.

The work table tipping means of the Heys patent 860,377 is best shown in Fig. 3 of the drawings. As there shown, the work table a^3 is carried by a table lever a^4, which is pivoted at a^5 on the upper end of a supporting rod a^2. At its outer end this table lever a^4 has a fork which embraces a double flanged adjusting nut b^4, which can be screwed up and down on the rod b. By adjusting this nut, the table lever a^4 can be swung up and down, thus tipping the table more or less, thereby adapting the machine to the particular character of work for which it is for the time being intended.

The indenting and burnishing machine has means for giving the same tip to the table, for the same purpose. As shown in Figs. 1 and 2 of the drawings, Defendants' Exhibit 354, the work table 10 is supported by, and turns upon, a bracket 11, which in turn is adjustably connected to arm 12. This bracket has an elongated slot and the arm 12 carries an adjustable clamping bolt 13 which passes through this slot. By loosening this bolt 13 the work table can be tipped to any desired extent within the range of adjustment and can be maintained in any adjusted position by tightening up the clamping bolt 13.

Accordingly, the indenting and burnishing machine has "means to tip" the work table as specified in each of claims 1, 2 and 6 of the Heys patent, and this table-tipping means is from a mechanical viewpoint identical with the corresponding table-tipping means of Heys patent No. 860,377, which I have just described, and has the same purpose and effect.

Mr. Chapman's contention of lack of infringement of these claims is based upon the circumstance that the Heys patent No. 860,377 has a second means for tilting the work table. He refers to the table-tipping means which I have just described as "set" means,

meaning thereby, I assume, that by this tipping means the work table can be set to any tipped position which the attendant may desire.

He contends, however, that the essential characteristic of the table-tipping means defined in claims 1, 2 and 6 demands the presence of the other tilting mechanism shown in the patent.

It will be noted on reference to the patent that the rod a^2 which supports the table lever a^4 is connected through a coupling a^{12} and a rod a^9 to a treadle a^{10}. Likewise, the rod b which supports the adjusting nut b^1 for tipping the work table is connected by a link b^4 with the same treadle. The connections between these respective rods and the treadle are at different distances from the pivot a^{11} of the treadle. Consequently, as the treadle is depressed these respective supporting rods are moved to different extents and with the result of giving a tilt to the table as it is raised and lowered.

Mr. Chapman endeavors to include these instrumentalities in claims 1, 2 and 6 under the expression "means to tip" the work table.

This contention is negatived by the patent itself.

The Heys patent refers to this tilting action not as tipping the table, but as varying its pitch. For example, beginning at line 76, page 3, the specification says: "I will now explain why I have provided the means for varying the pitch of the work-supporting table simultaneously with the depression of the same." This makes it unmistakable that the pitch-varying means is operative when the work-supporting table is depressed, which is not true of the table-tipping means, which is a "set" means for maintaining a desired operative adjustment.

When Heys wanted to claim his pitch-varying means he did so by appropriate language. Claims 3, 4, 5 and 14 of the patent include this changing of the pitch of the table. For example, claim 3 refers to "connections between said treadle and table for simultaneously changing the elevation and pitch of the table".

It is therefore certain that Heys does not refer to this pitch-varying means when he recites "means to tip" the work table in claims 1, 2 and 6.

Accordingly, I find the subject-matter of each of these claims 1, 2 and 6 of the Heys patent No. 860,377 in the indenting and burnishing machine made by the defendant.

Indeed, it would be interesting to know how Mr. Chapman would draw a claim different from claims 1, 2 and 6 if he wished to define the "set" table-tipping means of the Heys patent to the exclusion of the pitch-varying means. Obviously these identical claims would have been appropriate in a patent specification describing indenting and burnishing machine.

Int. 6. Mr. Chapman, a witness called on behalf of the petitioner, was interrogated in regard to loading and attaching machine, model B, McKay automatic heel, as manufactured by the United Shoe Machinery Company, and states that he examined that machine and compared the same with claims 10 and 11 of patent to Plant No. 958,282, May 17, 1910, and that, in his opinion, said claims 10 and 11 are not infringed by said machine. Please state whether or not you have examined the machine referred to by Mr. Chapman and whether you agree with him in the conclusions which he has stated in regard to said claims 10 and 11 of patent to Plant No. 958,282. If not, state whether or not, in your opinion, said machine embodies the mechanism set forth in said claims, and point out briefly what, in your opinion, are the errors, if any, in the premises whereby Mr. Chapman reached his stated conclusion as to infringement.

Ans. I have examined the loading and attaching machine, model B, McKay automatic heel, and I will refer to it as the loading and attaching machine, model B. Mr. Chapman is in error as to the construction and operation of this machine.

Mr. Chapman states that loading and attaching machine, model B, does not have "nail driving devices sustained by the cross-head" as recited in claim 10 of Plant patent No. 958,282, and that it does not have "nail drivers carried by the cross-head" as recited in claim 11 of said patent.

Mr. Chapman is wrong as to the facts.

In the machine of this Plant patent the main functional office of the cross-head is to compress a heel prior to driving nails into the

heel. The cross-head rigidly sustains a nail block having apertures for the nails. After the heel has been compressed by the cross-head then the nail-driving devices, carried and sustained by the cross-head, have an independent movement of their own, and as a result the nail drivers registering with the holes in the nail block drive the nails into the heel.

All of this is true of the loading and attaching machine, model B. To illustrate this machine I produce a photograph of it, to which I have added reference letters to indicate the parts to correspond to those recited in claims 10 and 11 of the said Plant patent No. 958,282.

[*Photograph of loading and attaching machine, model B, McKay automatic heel, is offered in evidence, and marked "Defendants' Exhibit 355".*]

As shown in this photograph, the loading and attaching machine, model B, has an open frame cross-head comprising two horizontal bars A and B rigidly connected to each other by means of two vertical rods C. Only one of these two rods C is shown in the photograph, the second one being concealed by the intervening mechanism. The upper bar A carries the nail block with its apertures in which the nails are placed preparatory to being driven into the heel.

The gang of nail drivers is shown at D. These nail drivers, constituting nail-driving devices, are mounted upon a horizontal bar E, which has rigidly connected with it two depending sleeves F. Each of these sleeves F surrounds one of the vertical rods C, upon the frame cross-head.

When the machine is at rest these sleeves F rest upon the lower bar B of the cross-head. Accordingly, the cross-head sustains and carries the nail drivers or nail-driving devices.

In the action of the machine the cross-head is first moved for the purpose of compressing the heel. This movement is effected by toggles which are shown at G in the photograph. After the heel has thus been compressed, the nail drivers or nail-driving devices have a movement of their own independent of the cross-head, this movement being effected by the toggle shown at H in the photo-

POOR

graph. As a result of this independent movement of the nail drivers the nails are driven into the heel.

As pointed out, Mr. Chapman's contention of non-infringement is based upon the supposition that the nail-driving devices or nail drivers are not sustained or carried by the cross-head. In this he is wrong.

Loading and attaching machine, model B, contains and embodies the entire subject-matter of each of claims 10 and 11 of Plant patent No. 958,282.

Int. 7. Referring to lockstitch machine, model M, No. 927, which Mr. Chapman states was shown him by Mr. Warren, Mr. Chapman testified in substance that he finds therein all the elements called for by claims 1, 2, 4, 5 and 9 of patent to Plant No. 940,723, November 23, 1909, and all the elements called for in claims 9 and 10 of patent to Plant No. 940,725 in substantially the relation noted and apparently for the same purpose. He also states that each of said claims calls for the movement of a slitting device to initial position to cause said device to slit the work, this being on return movement of the said device, and states that this feature is a distinguishing element lending alleged patentability or patentable novelty to each of the claims. He also referred to this feature as a trivial limitation and hardly important enough to impart patentable novelty to said claims. What have you to say in regard to these statements by Mr. Chapman?

Ans. I have examined lockstitch machine, model M, No. 927, which I will refer to as "lockstitch machine — model M". I agree with Mr. Chapman that this machine has the subject-matter of the claims of the two Plant patents No. 940,723 and No. 940,725 as enumerated in the question. I do not agree with Mr. Chapman's assertion that the improvement, consisting of the slitting knife and its adjuncts, is a triviality. On the contrary, it is a valuable and important improvement upon the character of lockstitch sewing machine shown in the two Plant patents and exemplified by the lockstitch machine, model M.

These lockstitch machines are used to sew the out-sole to the shoe, the stitches passing through the out-sole and through the projecting welt extending outwardly from the insole of the shoe.

OPY

The purpose of the movable slitting knife is to cut a slit in which the stitches may be concealed.

One of these lockstitch machines is a very intricate and complicated machine involving a large number of operative instrumentalities working within a small space. Such a machine involves a needle, a looper, a shuttle, a take-up, a movable presser-foot, a work table, a pull-off, a thread-measuring finger, and feeding mechanism which comprises an awl and awl carrier. These parts must co-operate together in making the stitches, and many of them have to be grouped right close to the stitch-making point.

One of the important factors in the machine resides in the awl-feeding mechanism. This awl is a slender instrument which has to pierce the welt and the out-sole, then feed the shoe along, and then retire from the leather and move backwardly to its initial position ready for again feeding the shoe. After the awl has completed its feeding movement the presser-foot clamps the shoe in place.

On account of the slender nature of the awl, it is important that its labor should be minimized in the case of a high-speed machine.

The inventions of the two patents to Plant in question include a slitting knife, the purpose of which is to make a slit in advance of the stitching. The knife is a movable one, and it is so organized that it performs its slitting movement at a time when the shoe is clamped against the work table by the presser-foot and when the awl is performing its idle return movement and not doing any mechanical work.

As the result of this organization the knife performs its work at the right place, and at the right time, and without burdening the awl. It performs its cutting stroke when the shoe is clamped in place, so that the cutting stroke is of a uniform depth and uniform length.

In the organization of these two Plant patents, and in the lockstitch machine, model M, the movable slitting knife is applicable to high-speed machines and does not involve any cutting down of the speed thereof.

I do not understand on what ground Mr. Chapman characterizes

2836

this improvement as a trivial one. It can only be compared with a stationary knife. Obviously, if the knife were stationary it could slit the leather only when the leather was being fed along by the awl, thus imposing additional labor upon the awl, which, already, has the maximum mechanical work to perform in the machine. Also, the cutting of the stationary knife would be accomplished when the shoe was not clamped in place by the presser-foot and work table, since the feeding of the shoe demands that it shall not be clamped in place. Accordingly, the depths of the slit would be variable.

In the case of a high-speed machine, the slitting work accomplished by a stationary knife would be the result of the movement of the slender awl and the result inevitably would be to flex the awl more or less and accordingly to make stitches of variable lengths.

There is no justification for belittling the importance of this improvement. It is an advantage and a very meritorious improvement.

Int. 8. Have you examined the machine officially known as "Lockstitch Machine, Model K, Goodyear Outsole Rapid"? If so, how does the fudge-stitch mechanism of that machine compare with that embodied in the model M machine?

Ans. I have examined the model K machine, and so far as the fudge-stitch mechanism, namely, the movable slitting knife and its adjuncts, is concerned the model K is like the model M.

Int. 9. Mr. Chapman, a witness called in behalf of the petitioner, testifies that he examined nailing machine, American Lightning, No. 3070, and made a comparison of the same with claims 15 and 16 of patent to Plant No. 958,302, May 17, 1910, and that, in his opinion, said claims 15 and 16 are not infringed by said machine. Please state whether or not you have examined said machine, whether or not you agree with Mr. Chapman in his conclusions, and whether or not you find in said machine the mechanisms set forth in said claims 15 and 16 of said Plant patent No. 958,302.

Ans. I have examined the nailing machine, American Lightning, No. 3070, which I will refer to as the "American Lightning ma-

chine". I do not agree with Mr. Chapman. This machine does embody the subject-matter of each of claims 15 and 16 of the Plant patent No. 958,302.

Concerning claim 16, Mr. Chapman states that its subject-matter is not in the American Lightning machine, because that machine lacks "devices for operating on a heel", coupled with the further clause or element of the claim "of means for guiding said devices and apertures into alignment".

In this Mr. Chapman is mistaken. The purpose of the machine of this Plant patent No. 958,302 is to drive nails into a heel at an angle to the outer or tread face of the heel, as shown in Fig. 14 of the patent drawings. This diagonal driving is especially useful in connection with heels which are inclined forwardly at the rear, as is conspicuously true of the heel of a lady's shoe, and to some degree in practically all shoes.

As shown in the Plant patent, there is a stationary nail block 44, having apertures in which the nails are inserted preparatory to being driven into the heel. The driving of the nails is accomplished by a plurality or gang of nail drivers 56, which move in and out of the apertures of the nail block 44. These nail drivers are carried by a suitable reciprocating support.

It is highly important in this organization that when the nail-driving devices or nail drivers descend for the purpose of entering the holes in the nail block and driving the nails that they should accurately register with the nail holes as they approach them. This is particularly important, as any lost motion or loose joints may result in the nail drivers hitting the nail block and not entering the holes. Accordingly, the Plant patent provides means for guiding the devices which operate on the heel. These guiding means comprise a guide 104, shown in Fig. 14, which co-operates with the roller 107, carried by the nail drivers' support at one side. As a result, the nail drivers are brought into proper registration with the nail holes in the nail block.

Also the organization is such that just as soon as registration is effected the guiding means lose control of the nail drivers so that

thereafter they are free to accommodate themselves to the nail block as occasion may demand.

The American Lightning machine has the same guiding means as called for by claim 16 of the Plant patent No. 958,302. In order to explain the American Lightning machine I refer to the Pope patent No. 1,072,986, September 9, 1913, which constitutes one of the patents included in Defendants' Exhibit 164. This Pope patent illustrates the pertinent mechanism of the American Lightning machine.

As shown in the drawings, there is a stationary nail block 12 having nail holes 13, into which the nails are introduced preparatory to their being driven into the heel of the shoe. These nail holes extend at an inclination, as is desired in nailing the class of heels to which I have referred.

Above the nail block is a reciprocating cross-head 14, which carries the support for the nail drivers 26, which in this Pope patent constitutes the means for operating on the heel. The support for the nail drivers is a slide composed of a block 24 and a plate 22. The nail drivers are guided into proper registration with the nail holes 13 by means of a guide rod 32, and an aperture in the outer end of the slide plate 22. This guide rod 32 is mounted upon a fixed support 36.

When the heel-operating devices, namely, the drivers, are in their raised position, the guide rod 32 enters the hole in the driver slide, as shown in Fig. 1. As the drivers descend, this guiding means accurately guides the drivers until their lower ends are in register with the holes in the nail block beneath. As soon as this registration is secured, the guiding means loses control of the nail drivers, because the aperture in the slide passes below the end of the guide rod 32. Thereafter the guiding means no longer controls the nail drivers, which are free to accommodate themselves to the holes in the nail block.

Mr. Chapman's contention is that this American Lightning machine does not have the subject-matter of claim 16 of the Plant patent No. 958,302, because it has no "devices for operating on a heel". Obviously this is wrong, because the American Lightning

machine has the nail drivers 26, which are devices for operating on a heel and correspond exactly to the like nail drivers of the Plant patent.

On cross-examination, however, it seems that Mr. Chapman endeavors to distinguish between the Plant machine and the American Lightning machine, because Plant has two groups of tools which operate upon the heel, whereas the American Lightning machine has only one group of tools, namely, the drivers.

In the machine of the Plant patent No. 958,302 there is a set of awls 54, as well as the set of nail drivers 56, and the specific operation of the machine is, first, to puncture holes in the heel by means of the awls, and then to move the awls out of action and bring the nail drivers into action, so that the nail drivers drive the nails into the holes punctured in the heel by the awls.

Mr. Chapman's contention, as I understand it, is that the "devices for operating on a heel", as recited in claim 16, necessarily mean both awls and the drivers, and because under this contention the American Lightning machine only has half of the Plant invention, the subject-matter of the claim is not present.

This contention is untenable, as demonstrated by the Plant patent itself.

In the first place, "devices for operating on a heel", as defined in claim 16, is a generic expression equally applicable to define both the drivers and the awls. Plant was entitled to a claim which would cover his guiding means, whether used with awls or with drivers. He could not have chosen more apt language than that used in claim 16 to cover generically the invention. Indeed, claim 16 would be an appropriate claim to present in a patent specification on the American Lightning machine; it is also apparent from other claims presented in this Plant patent that when Plant wished to be specific he knew how to do so by proper language. When he wanted to claim both awls and drivers he did so in the manner shown by claim 25, which calls for a turret having "awls and drivers". On the other hand, when he wished to identify one set of his heel-operating devices he did so by proper language. Take claim 5, for example, which specifies "nail driving devices".

Moreover, the claims are in accord with the specification. Beginning at line 25, page 2, the specification says: "Preferably the intended offices of the machine are performed by an appropriate tool or tools when a heel is engaged between the anvil 30 and the nail block 44. In the illustrative machine (Fig. 3) there are two groups of tools — a gang of awls 54 and a gang of drivers 56 which in the usual manner enter apertures in the nail block 44."

Further on, beginning at line 103, page 2, the Plant patent specifically says: "Preferably some means is provided for guiding the awls or drivers in their downward movement in order to aline them with the apertures in the nail block."

Hence, it is apparent that the invention including the guiding means is applicable to either the awls or the nail drivers optionally, and that the inclusion of both of these sets of tools in one machine is merely illustrative of the generic invention.

Accordingly, therefore, I find the entire subject-matter of claim 16 in the American Lightning machine.

In connection with claim 15 of this Plant patent No. 958,302, Mr. Chapman urges the same contention with respect to claim 15, which I need not further discuss.

In addition, he gives another reason for not finding the subject-matter of claim 15 in the American Lightning machine, namely, that claim 15 recites "said moving parts and supports having one a slot parallel with the apertures in said block".

That is to say, in the Plant patent the guide 104 is parallel with the holes in the nail block 44. On the other hand, the guide of the American Lightning machine, as shown at 32 in the drawings of the Pope patent No. 1,072,986, is at an inclination to the holes in the nail block.

This geometrical distinction between the two machines does exist.

Practically there is no substantial difference between the two machines in which the instrumentalities act in the same way for producing the same result. In both machines it is desired to drive the nails at an angle to the tread face of the heel. This Plant accomplished by inclining his entire machine, as shown in Fig. 6

of the drawings of his patent No. 958,302; and thus inclining the entire machine his guide is parallel with his nail holes. But, on the contrary, in the American Lightning machine the same result is obtained, not by inclining the entire machine, but by inclining the holes in the nail blocks and correspondingly inclining the nail drivers.

In both machines the purpose of the guiding means is to guide the nail drivers until they register with the nail holes and then to lose control over the nail drivers, so that thereafter the nail drivers may accommodate themselves to the holes in the nail block. From a mechanical viewpoint the two arrangements are equivalent.

Accordingly I find the subject-matter of claim 15 of the Plant patent No. 958,302 in the American Lightning machine.

Int. 10. Mr. Chapman has referred to wheeling machine No. 2, Goodyear impression stitch, which he says was shown to him by Mr. Warren, and carries name-plate indicating Booth Brothers, No. 986. Mr. Chapman states that he made a comparison of claims 2 and 5 of the Heys patent No. 784,263, March 7, 1905, with the structure of said machine and reached the conclusion that claims 2 and 5 of the patent are not infringed by said machine. Please state whether or not you agree with Mr. Chapman in his conclusion. If not, state whether, in your opinion, said machine embodies the subject-matter of claims 2 and 5.

Ans. I have examined the wheeling machine No. 2, Goodyear impression stitch, bearing the name-plate with the words "Booth Brothers", and the number "986". I will refer to it as the wheeling machine No. 2.

I do not agree with Mr. Chapman. Mr. Chapman points out a mechanical difference which does exist between the machine of the Heys patent No. 784,263 and the wheeling machine No. 2, but this is of no importance, because the construction of the wheeling machine No. 2 simply has a reversal of corresponding parts of the Heys patent No. 784,263, accomplishing the same purpose. This Heys patent No. 784,263 is for a stitch-indenting machine for making indentations on the upper surface of the projecting margin of the shoe sole, and its co-operative instrumentalities are

a support 60 for the shoe sole, and a power-driven rotary indenting tool 26. Figures 1 and 2 of the drawings of the Heys patent show the shoe in position between the shoe support and the rotating indenting tool.

As disclosed in this Heys patent, when the shoe is to be placed into operating position on the machine and withdrawn therefrom after the work has been completed, there is a relative separation effected between the shoe support and the indenting tool. At the same time the rotary tool is unclutched from its power pulley, so that the tool does not rotate when the machine is idle. In the specific embodiment of the invention shown in the patent, the separation between the tool and the shoe support is effected by moving the tool away from the shoe support concurrently with the unclutching of the rotary tool from its driver.

The only difference between the machine of the Heys patent, so far as the subject-matter of claims 2 and 5 thereof are concerned, and the wheeling machine No. 2 is that in the wheeling machine No. 2 the separation of the tool and shoe support is effected by moving the shoe support away from the tool instead of moving the tool away from the support. This is an obvious reversal and from the mechanical viewpoint the two arrangements are equivalent.

The construction of the wheeling machine No. 2 is illustrated in the Flynt patent No. 958,913, May 24, 1910, which constitutes one of the patents in Defendants' Exhibit 199. As shown in the drawings of this patent, 2 is the rotary impression wheel, and 24 is the work support. When the shoe is to be placed in the machine or removed, the work table is moved downwardly away from the tool, and at the same time the tool is unclutched from its source of power. This reversal of the movement of two operating parts is the distinction which Mr. Chapman relies upon in distinguishing the wheeling machine No. 2 from the subject-matter of claims 2 and 5.

In this connection, Mr. Chapman says that the wheeling machine No. 2 lacks the elements of claim 2, which are defined as "'movable means for supporting the tool', in combination with 'mechanism for automatically moving said supporting means to inactive posi-

tion and operating said clutch to effect a cessation of rotation of the tool.'" And, "as to claim 5, the machine lacks the element 'a movable head therefor', referring to the movable head of the patent for supporting the rotary tool", and also "lacks the element of claim 5 'means for simultaneously unclutching the clutch mechanism from the shaft to stop the rotation of said tool and moving the said head toward inoperative position'."

Mr. Chapman is correct as to the distinction that he draws with respect to the mechanical facts, but he does not point out that the wheeling machine No. 2 has a mere reversal of the movement of the parts defined in these two claims. This mere reversal is a mechanical equivalent from a mechanical viewpoint. Therefore, wheeling machine No. 2 contains the entire subject-matter of each of claims 2 and 5 of the Heys patent No. 784,263.

Mr. PHILLIPS. The direct examination of the witness is closed, reserving, however, the right to recall the witness in case counsel has inadvertently failed to ask him any questions.

[*Hearing adjourned, subject to agreement of counsel.*]

BOSTON, MASS., March 19, 1914.

Cross Examination by ALLEN WEBSTER, Esq., *of Counsel for* THE UNITED STATES.

Mr. WEBSTER. In view of the fact that the deposition of this witness consists largely of matter in the nature of argument rather than testimony, counsel for complainant objects to the same and reserves the right to insist upon such objection at the hearing, and the cross-examination will be without waiver of such right.

Cross-Int. 11. You have testified to a considerable extent with reference to the practicability of the machines to which you have made reference; have you had any experience in the operation of any of said machines?

Ans. Only to the extent of having seen them work; I have never personally done the work on these machines.

Cross-Int. 12. Have you ever compared the operation of the machines about which you have testified with other machines designed to accomplish similar results?

Ans. No.

Cross-Int. 13. As I understand your testimony, you concede that Mr. Chapman's statements as a general rule with reference to the mechanical differences are correct, but that such changes merely, in your opinion, amount to reversals or mechanical equivalents. Kindly state if I am right in my understanding.

Ans. You are so far as Heys patent No. 784,363 and a comparison with the wheeling machine No. 2 is concerned, and so far as the comparison between the second reason urged by Mr. Chapman in comparing claim 15 of the Plant patent No. 958,302 with the American Lightning machine is concerned.

Cross-Int. 14. In testifying with reference to pulling-over machine, model B, Rex, you say, as I understand you, that you have examined the machine to which you made reference. Will you kindly examine the patent to Heys No. 957,955, to which you made reference in your testimony, and particularly examine Fig. 1, the part marked "109", and state whether you found in the machine examined by you a rod or part shaped like the part marked "109" in Fig. 1?

Ans. I did not. The shape of the corresponding guiding device in pulling-over machine, model B, Rex, is well shown in the photographs Defendants' Exhibit 353 and Defendants' Exhibit 352. As shown by both these photographs, the speceific shape of the guiding device is different from that of the guiding device 109, Fig. 1 of the Heys patent.

Mr. WEBSTER. All of the foregoing answer following the words "I did not" is objected to as not responsive.

Cross-Int. 15. Do you wish the court to understand that the general construction of the machine examined by you, and as stated by you is illustrated in Defendants' Exhibits Photographs No. 352 and 353, is the same as the machine illustrated in patent to Heys No. 957,955?

Ans. No.

Cross-Int. 16. Now, it is a fact, is it not, that the gaging device referred to in claim 55 of the Heys patent 957,955 is merely some kind of a device which is laid over on top of, or just above, the

shoe to indicate to the operative where to move the upper; am I right?

Ans. Yes.

Cross-Int. 17. And any kind of a contrivance that would be capable of being moved over and indicate the position to which the leather was to be moved would accomplish the desired result, would it not?

Ans. Yes.

Cross-Int. 18. And in the device of the patent to Heys referred to in the claim in question the operative moves this gaging or indicating device into position, does he not?

Ans. Yes.

Cross-Int. 19. And the same result would be obtained whether he moved it into position by a foot lever or simply took hold of the measuring device by hand, would it not?

Ans. Yes.

Cross-Int. 20. Then the gaging device of claim 55 is merely some kind of an arm which is capable of being moved over and held at the desired point on top of, or just above, the leather, is it not?

Ans. Yes.

Cross-Int. 21. And, as I read your testimony, the only material difference between your testimony and Mr. Chapman's with reference to this contrivance is that you contend that it co-operates with the rest of the machine, while Mr. Chapman claims that there is no co-operation; am I right in my understanding?

Ans. I don't think so. Mr. Chapman's contention, as I understand it, is that the pulling-over machine, model B, Rex, does not have the subject-matter of claim 55 because it lacks the combination or co-operation called for by that claim. I do not agree with Mr. Chapman because there is exactly the same co-operation and combination in the pulling-over machine, model B, Rex, as there is in the machine of the Heys patent.

Cross-Int. 22. The real difference between you two experts is that one claims there is co-operation, and the other claims there is no co-operation; is not that correct?

Ans. No; not at all. Mr. Chapman does not deny that co-opera-

tion exists in the machine of the Heys patent. What he does state is that the pulling-over machine, model B, Rex, does not have the subject-matter of the claim because it lacks the co-operation existing in the machine of the Heys patent. In that he is wrong. There is exactly the same co-operation in the pulling-over machine, model B, Rex, as there is in the machine of the Heys patent.

Cross-Int. 23. Then the differences between you do hover around co-operation, do they?

Ans. Yes, so far as the pulling-over machine, model B, Rex, is concerned, Mr. Chapman denying that that machine has the same co-operation which is present in the Heys machine.

Cross-Int. 24. As I understand your testimony relating to indenting and burnishing machine, I understand you to hold that in the patent to Heys No. 860,377, about which you testified, that the word "pitch" means something different from the word "tip"; am I right in my understanding?

Ans. Yes; as the patent itself makes the distinction. That is to say, there is one particular kind of tilting or tipping which the patent refers to as varying the pitch, this occurring simultaneously with the depression of the work-supporting table. In addition the patent describes a tipping of the table by means of an adjustment with which the machine is provided.

Cross-Int. 25. In the machine examined by you does the work support tip at all simultaneously with the depression of the same?

Ans. In an absolute sense I presume that is true. That is to say, in the indenting and burnishing machine the work table is carried by a swinging arm, shown at 54 in Defendants' Exhibit 354, and consequently as the work table is depressed when this arm swings its angle to any given plane changes.

Cross-Int. 26. Then you state as a fact, do you, that the machine examined by you, and to which you have testified, is so constructed that when the supporting table is moved vertically its pitch is varied at the same time?

Ans. Absolutely; yes; but not within the meaning of the Heys patent.

Cross-Int. 27. And when you say "not within the meaning of

the Heys patent" you mean not within the meaning of the claims to which you have made reference in the Heys patent, do you?

Ans. Yes; so far as those claims are concerned which are directed to varying the pitch of the table, such as claims 3, 4, 5 and 14. The claims which I discussed, namely, claims 1, 2 and 6, have nothing to do with varying the pitch.

Cross-Int. 28. You testified with reference to loading and attaching machine, model B, McKay automatic heel; you say, among other things: "In the machine of this Plant patent the main functional office of the cross-head is to compress a heel prior to driving nails into the heel." Do you understand that this function was not employed in any nail-driving machine prior to its employment as set out in the Plant patent?

Mr. PHILLIPS. Question objected to as not pertinent to any matter touched upon in the direct examination of this witness, and as outside the order of the court under which this testimony is being taken.

Ans. No.

Cross-Int. 29. The question as to the function of a part as defined in a claim is to be determined somewhat, is it not, by the prior art?

Ans. No.

Cross-Int. 30. Then do you say the prior art makes no difference?

Mr. PHILLIPS. Objected to as improper cross-examination.

Ans. Absolutely. A device performs its functions whether it is old or new.

Cross-Int. 31. Then the meaning of a claim is precisely the same, is it, without reference to the prior art?

Mr. PHILLIPS. Objected to as improper cross-examination.

Ans. Yes, unless the claim is an ambiguous one. If the claim is plain and it is unmistakable on its face in connection with the patent of which it forms a part, no extraneous matters are necessary in order to understand its meaning. If the claim, however, is ambiguous, it may be necessary to seek light outside of the patent itself to find out the meaning.

Cross-Int. 32. Do you wish to convey the impression to the court

that the photograph Defendants' Exhibit 355 is a picture of the machine illustrated in the patent to Plant No. 958,282?

Ans. No.

Cross-Int. 33. There is in fact a vast difference in the construction and operation of the two machines, is there not?

Ans. There are many differences.

Cross-Int. 34. I note, in testifying with reference to lockstitch machine, model M, in speaking of the awl, you say "it is a slender instrument". Kindly state, if you are able, the diameter of the awl to which you refer.

Ans. It is a long time since I have actually measured an awl. It is somewhat larger in diameter than a needle.

Cross-Int. 35. Can you tell the diameter of a needle?

Ans. Not in fractions of an inch.

Cross-Int. 36. Can you approximate it?

Ans. Not sufficiently to justify a statement. There is one of these awls in evidence, Defendants' Exhibit 111. It speaks for itself as to the dimensions of the awl.

Cross-Int. 37. As it may not be convenient for the Court to examine the awl itself, have you any objection to stating on the record its diameter or distance through?

Ans. I have no measuring instruments here. I should say it was about one-thirty-second of an inch square.

Cross-Int. 38. Do you know whether awls are made larger or smaller for ordinary work?

Ans. All that I have seen have been substantially like this exhibit. They ought to be as small as possible. It is objectionable to punch a hole any bigger than is necessary.

Cross-Int. 39. In the prior mechanisms to which you made reference I understand you to say that the burden of the work involved in cutting the slit was borne by the awl; am I right?

Ans. I simply referred to a hypothetical case for the purpose of affording a standard of comparison. In accordance with my hypothesis the burden would be borne by the awl.

Cross-Int. 40. Then, as I understand you now, you do not wish

to convey the idea to the Court that as a fact the awl has been called upon to sustain the burden of the feed?

Ans. Certainly the awl does bear the burden of the feed: that is what it is for. It is the feeding instrumentality in the machine.

Cross-Int. 41. And does it bear such burden when it is inserted in the material as far as it will enter, or is it at some intermediate point?

Ans. When it has entered the material as far as it goes.

Cross-Int. 42. Then after it has completed its entering stroke it moves laterally, does it?

Ans. Yes.

Cross-Int. 43. So that the feeding burden is applied when the larger and stronger portion of the awl is in the work; am I right?

Ans. No; the awl never penetrates the work far enough to bring that larger portion into the leather.

Cross-Int. 44. Using Defendants' Exhibit 111 for illustration, will you kindly state how far the shank of the awl projects from the supporting mechanism, or, in other words, where the awl proper begins and where the shank leaves off?

Ans. As I understand the question, you refer to the larger portion of the awl as the shank, and the rest of it as the awl proper. I will have to guess at the measurement because I have no instruments. I should say the full width of the shank extends about one-tenth of an inch beyond the carrier or support. There is then a taper for about one-sixteenth of an inch more; then there is about a half an inch of the awl proper until the bevel point is reached. The bevel is longer on one portion of the awl than on the other, perhaps one-sixteenth of an inch on one side and one-thirty-second on the other. These measurements are, of course, mere estimates, as I have no way of verifying them.

Cross-Int. 45. Will you state to the Court what particular machine you have personal knowledge of where the awl gave or bent or flexed while feeding the material, resulting in imperfect work?

Mr. PHILLIPS. Objected to as not pertinent to any matter touched upon in the direct examination of this witness, and outside the order of the court.

Ans. So far as my observation has gone, when the awl has been used as the work feeder, it has properly acted. I do not for the moment recall any instance of the awl failing to operate properly except when some accident has occurred.

Cross-Int. 46. And you say that the cutting stroke would not be of uniform depth and uniform length if it took place when the material was being fed by the awl?

Ans. I understand that this question now refers to my hypothesis of the employment of a stationary slitting knife in a high-speed machine. I am entirely confident that the extra work thus put upon the awl would cause such irregularity as to produce irregularity in the length and depth of the cuts. I make this statement upon my general mechanical knowledge.

Cross-Int. 47. And the fact that machines had operated successfully for anywhere from ten to twenty years without having incorporated in them the mechanisms to which you have made reference in testifying about lockstitch machine, has no influence in your mind with reference to the question as to whether the operation of the machines without the Plant improvement were successful or not?

Mr. PHILLIPS. Objected to as relating to nothing touched upon in the direct examination of this witness, and outside the order of the court.

Ans. I don't understand what machine you have reference to as having been used from ten to twenty years.

Cross-Int. 48. You know, do you not, that lockstitch machines designed for attaching the welt to the out-sole have been in successful use for twenty years?

Mr. PHILLIPS. Objected to as relating to nothing touched upon in the direct examination of this witness, and outside the order of the court.

Ans. I did not know that you referred to the ordinary out-sole stitcher. I am familiar with those machines. In those the awl has simply the work to do of feeding the shoe along. Those machines were low-speed machines. The speed being low and the awl having nothing to do except feed the work, it did the work properly.

Cross-Int. 49. Do you wish the Court to understand that from your knowledge the mechanism in a lockstitch out-sole machine was not employed successfully until the mechanisms of these Plant patents was incorporated therein, in so far as cutting a groove in the welt is concerned?

Mr. PHILLIPS. Objected to as relating to nothing touched upon in the direct examination of this witness, and outside the order of the court.

Ans. No.

Cross-Int. 50. Can you state when mechanisms were first incorporated in out-sole lockstitch machines adapted for cutting a channel in the welt as it was being attached to the out-sole?

Mr. PHILLIPS. Objected to as relating to nothing touched upon in the direct examination of this witness, and outside the order of the court.

Ans. No.

Cross-Int. 51. It is a fact within your knowledge, is it not, that such devices were used prior to the date of the Plant patents?

Mr. PHILLIPS. Objected to as relating to nothing touched upon in the direct examination of this witness, and outside the order of the court.

Ans. No.

Cross-Int. 52. Have you any practical knowledge of what was used to cut such channel before the incorporation of the alleged improvement of the Plant patent?

Mr. PHILLIPS. Objected to as relating to nothing touched upon in the direct examination of this witness, and outside the order of the court.

Ans. No.

Cross-Int. 53. So that, so far as the particular subject-matter under discussion is concerned, you have no practical knowledge of the operation of the machines and no practical knowledge or experience as to what defects, if any, did in fact exist, have you?

Mr. PHILLIPS. Objected to as relating to nothing touched upon in the direct examination of this witness, and outside the order of the court.

Ans. What machine are you talking about now?

Cross-Int. 54. Rapid out-sole lockstitch machine, having special reference to the channel-cutting mechanism which operates during the stitching operation.

Ans. The only out-sole lockstitch machines having a slitting knife with which I am familiar are lockstitch machines, models K and M. Both of those machines have the improvement of the Plant patents Nos. 940,723 and 940,725.

Cross-Int. 55. In testifying concerning nailing machine, American Lightning, you say, among other things: "The purpose of the machine of this Plant patent No. 958,302 is to drive nails into a heel at an angle to the outer or tread face of the heel, as shown in Fig. 14 of the patent drawings. The diagonal driving is especially useful in connection with heels which are inclined forwardly at the rear, as is conspicuously true of the heel of a lady's shoe, and to some degree in practically all shoes." Kindly state whether by that phraseology you mean to say that practically all shoes have their heels attached by nails which are driven through the heels at an angle from the tread face.

Ans. No.

Cross-Int. 56. Then is it true that very many shoes have their heels attached in such manner that the attaching nails are driven through the heels at right angles to the tread face?

Ans. Yes.

Cross-Int. 57. And very many heels which are inclined forwardly at the rear are attached with nails which are not driven at an angle with the tread face, are they not?

Ans. Yes.

Cross-Int. 58. Kindly examine Plaintiff's Exhibit No. 283, and state whether it correctly illustrates, so far as you are informed, the relation of the nail to the heel in the kind of shoe you have made reference to in your testimony in chief.

Mr. PHILLIPS. Objected to as pertinent to nothing in the direct examination of this witness, and outside the order of the court.

Ans. Substantially so.

Cross-Int. 59. Kindly examine Defendants' Exhibit 350, and

state whether it is a shoe of the character referred to in your direct examination.

Mr. PHILLIPS. Objected to as pertinent to nothing in the direct examination of this witness, and outside the order of the court.

Ans. Yes; this is an extreme case.

Cross-Int. 60. And do you say that the heel of that shoe, Defendants' Exhibit 350, is attached by the driving of nails in the manner as set forth in the machine of the patent to which you have testified?

Mr. PHILLIPS. Objected to as pertinent to nothing in the direct examination of this witness, and outside the order of the court.

Ans. I have not the faintest idea.

Cross-Int. 61. Will you examine Plaintiff's Exhibit 281, and state, if you can, whether the heel is attached by having the nails driven at right angles to the tread face, or whether they are driven at an angle?

Mr. PHILLIPS. Objected to as pertinent to nothing in the direct examination of this witness, and outside the order of the court.

Ans. It is impossible to tell from the completed shoe how nails have been driven without taking the shoe to pieces. It is useless to show me any more shoes; I cannot tell how any of them have been nailed unless I tear them apart.

Cross-Int. 62. Kindly examine Plaintiff's Exhibit 282, and state whether the heel of that shoe is inclined forwardly at the rear.

Mr. PHILLIPS. Objected to as pertinent to nothing in the direct examination of this witness, and outside the order of the court.

Ans. It is.

Cross-Int. 63. Kindly state whether the shoe examined by you, Plaintiff's Exhibit 282, is the kind of shoe referred to in your testimony when you say: "This diagonal driving is especially useful in connection with heels which are inclined forwardly at the rear."

Mr. PHILLIPS. Objected to as pertinent to nothing in the direct examination of this witness, and outside the order of the court.

Ans. It is.

Cross-Int. 64. State, if you can, whether the heel of Plaintiff's Exhibit 282 is attached by nails driven diagonally to the tread face.

Mr. PHILLIPS. Objected to as pertinent to nothing in the direct examination of this witness, and outside the order of the court.

Ans. I cannot tell except by such examination as would involve ripping the exhibit apart.

Cross-Int. 65. Have you any information as to when this diagonal driving of nails to attach heels to shoes first went into use?

Mr. PHILLIPS. Objected to as pertinent to nothing in the direct examination of this witness, and outside the order of the court.

Ans. No.

Cross-Int. 66. So that you have no information as to whether the claims of the Plant patent to which you have testified concerning a machine for driving nails at an angle were in the nature of pioneer claims or not, have you?

Mr. PHILLIPS. Objected to as pertinent to nothing in the direct examination of this witness, and outside the order of the court.

Ans. The claims of this patent which I have discussed do not purport to cover diagonal driving. On the contrary, these claims are directed to means for guiding the drivers into registration with the holes in the nail block and then letting go. So far as I am aware, Plant was the pioneer in doing this.

Cross-Int. 67. And is it not a fact, to your knowledge, that heels had been attached to shoes by nails driven at an inclination to the tread face long prior to the alleged invention of Plant patent to which you have testified?

Mr. PHILLIPS. Objected to as pertinent to nothing in the direct examination of this witness, and outside the order of the court.

Ans. No.

Cross-Int. 68. Have you any knowledge at all with reference to this?

Mr. PHILLIPS. Objected to as pertinent to nothing in the direct examination of this witness, and outside the order of the court.

Ans. I had seen a great many heel-nailing machines prior to the application date for this Plant patent, but I never saw one which did diagonal driving.

Cross-Int. 69. About when, so far as you are able to state, did you see a machine of the character referred to in your last answer?

Mr. PHILLIPS. Objected to as pertinent to nothing in the direct examination of this witness, and outside the order of the court.

Ans. From about 1896 or 1897 up to about, say, 1907 or 1908.

Cross-Int. 70. And did the machines which you have knowledge of, extending from, say, 1896 to 1907 or 1908, successfully attach heels to shoes such as is shown in Defendants' Exhibit 348?

Mr. PHILLIPS. Objected to as pertinent to nothing in the direct examination of this witness, and outside the order of the court.

Ans. I never saw those machines used on heels of the character of this exhibit.

Cross-Int. 71. Can you state whether the machines referred to by you, which you have knowledge of as existing between 1896 and 1907 or 1908, were operated successfully for attaching heels in the manner as shown in Plaintiff's Exhibit 282?

Mr. PHILLIPS. Objected to as pertinent to nothing in the direct examination of this witness, and outside the order of the court.

Ans. I would not be sure about that. I should say they were more of the kind shown in Exhibit 281.

Cross-Int. 72. You do not wish to convey the impression to the Court that heels cannot be attached to shoes as shown in Plaintiff's Exhibit 282 by nails being driven therethrough in a direction at right angles to the tread of the shoe?

Mr. PHILLIPS. Objected to as pertinent to nothing in the direct examination of this witness, and outside the order of the court.

Ans. No.

[*The signature of the witness to this deposition is waived.*]

Attest: CHARLES K. DARLING, *Special Examiner.*

[*Adjourned to 10 A. M., Monday, March 23, 1914.*]

BOSTON, MASS., March 23, 1914.

DEPOSITION OF GEORGE E. WARREN.

Direct Examination by BENJAMIN PHILLIPS, Esq., *of Counsel for Defendants.*

Int. 1. Your name is George E. Warren, and you testified in open court as a witness on behalf of the defendant, did you not?

Ans. I did.

Int. 2. I believe you stated that since the organization of the defendant corporation, with the exception of about two years, you had been in the employ of the defendant as a mechanical engineer; is that correct?

Ans. It is.

Int. 3. Please state what experience you have had since you have been in the employ of the defendant company as a designer of shoe-sewing machines, including out-sole stitching machines.

Ans. I have been constantly employed in that capacity.

Int. 4. Did you take any part in the designing of the machines which have been referred to in this record as lockstitch machines, Goodyear outsole rapid, models K and M?

Mr. WEBSTER. Objected to as immaterial.

Ans. They were designed under my direction.

Int. 5. Mr. Chapman, a witness called on behalf of the petitioner, has testified in regard to the so-called fudge-stitch mechanism embodied in lockstitch machine, model M. Please describe briefly the operation of lockstitch machine, model M, embodying this mechanism, with particular reference to the co-operation of such mechanism with the other operating parts of the machine.

Mr. WEBSTER. Objected to as immaterial, irrelevant and as not admissible by way of surrebuttal.

Ans. This device is arranged on the model M stitcher to cut a slit in the welt, of uniform depth, without imposing this duty on the awl. The knife projects above the work table a sufficient distance to cut the slit of such a depth that the stitches will be concealed. The knife is attached to a holder mounted on the frame of the machine and is so connected by levers and links with the feed

slide that the knife has whatever movements the feed slide and awl have. While the awl is through the leather and feeding the work, the slitting knife moves with it in the same direction, and after the awl is withdrawn from the work and making its idle return movement the slitting knife moves back with it and cuts a slit in the welt while the shoe is firmly clamped between the work table and presser-foot.

Int. 6. What is the importance, from the standpoint of a practical designer, of machines of this class, of so organizing the model M stitcher that in producing a fudge-stitch seam it will operate as you have just described?

Ans. The importance is that a slit will be cut in the welt, of uniform depth, and the awl will not have the added duty of dragging the shoe against the slitting knife to do the cutting. The awl is a very slender instrument and besides puncturing the hole in the stock is used to feed the shoe, which is on a last, along for each stitch. In high-speed machines like the model M, it was a serious problem to feed the work along so that the stitches would be of uniform length, and the needle must be able to enter the awl hole in the proper manner, so that the stitch-handling devices will be properly operated.

In order to get this uniform length of stitch and also have the needle properly enter the awl hole it was necessary to have the work so relieved during the feeding operation that the awl would have a minimum amount of work to do. To accomplish this it was found necessary to lift the presser-foot at each feeding operation so that the shoe would not have the friction on the work table and the presser-foot. While the presser-foot is so lifted and the work is fed along by the awl, it is found practically impossible to cut a slit in a welt, of uniform depth, because the tendency of the knife is to lift the work from the work table, and as it was found necessary, in order to get the high speed which was desired, to lift the foot from the work, it was necessary to arrange the slitting knife so that it would cut the slit while the work was securely held. Accordingly it was so arranged that the slitting knife would advance with the awl while the awl was feeding the work. Then

it does the cutting during the idle return movement of the feed slide and awl, while the work is securely clamped between the table and the presser-foot. Accordingly a uniform depth of slit was obtained and the awl had only the duty of puncturing the work and feeding it along.

Int. 7. Will you please state whether or not the fudge-stitch mechanism embodied in model K stitcher was the same as that embodied in model M, and whether or not its relation to the operation of the presser-foot was the same?

Ans. Its operation was exactly the same, and also its relation to the presser-foot.

Int. 8. Please state whether or not at the request of counsel for the United States certain machines were placed at the disposal of counsel for the United States and his expert at the office of the defendant in the Albany Building, 89 Beach Street, Boston.

Ans. Yes.

Int. 9. Will you please give a list of such machines? If they were Plant machines, indicate that fact in the list, and if they were machines put out by the United Shoe Machinery Company, also indicate that fact.

Ans. The following is a list of the Plant machines placed at their disposal: —

PLANT MACHINES.

Upper clicking machine.
Double lip channel opener.
Single lip channel opener and edge compressor.
Innersole flexor.
Innersole cloth tucker and lip trimmer.
Sole rounder.
Grinder.
Top-lift compressor.
Puller over and tip measurer.
Rapid side laster.
Toe and heel laster.
Turn heel laster.
Staple tacker.

Heel seat nailer.
Welt slasher and groover.
Tack puller and baster.
Welter.
Custom sole layer.
Rough rounder.
Heel seat dinker.
Shoe channeler.
Stitcher.
Loose nailer.
Leveler.
Heel loader.
Heeler.
Heel attacher on wood lasts.
Heel slugger.
Heel breaster.
Stitch indenter and burnisher.
Stitch separator.
Top-lift scalloper.
Heel waxer and burnisher.
Seat beader.
Treeing machine.
Bresnahan automatic sole-molding machine.
Keighley inseam trimmer.

And the following is a list of the United Shoe Machinery Company's machines: —

UNITED SHOE MACHINERY COMPANY'S MACHINES.

Lockstitch machine, model M, Goodyear outsole rapid.
Shoe machine, model K, Goodyear welt and turn.
Channeling machine, Goodyear Universal (turn work).
Grooving and beveling machine, Goodyear power welt.
Indenting and burnishing machine, Goodyear welt.
Lasting machine, No. 5, U. S. M. Co.
Leveling machine, model B, Hercules.
Loading and attaching machine, model B, McKay automatic heel.

Nailing machine, American Lightning.
Pulling-over machine, model B, Rex.
Rounding and channeling machine, model E, Goodyear Universal
Wheeling machine No. 2, Goodyear impression stitch.
Rounding machine, Goodyear heel seat (2 machines).

Int. 10. Please state whether or not the list of machines above stated by you includes all the machines referred to in Defendants' Exhibits 273 and 274.

Ans. All, with the exception of three machines, which I explained to Mr. Chapman it was not practical to have there, but they could be shown him in nearby shoe factories where they were in operation.

[*It is stipulated and agreed that counsel for defendants and his expert, Mr. Chapman, were given ample opportunity for the examination of all the machines in the lists heretofore given by this witness.*]

Int. 11. Please state whether or not you personally pointed out and explained to Mr. Chapman any of the machines in the lists which you have just stated on the record. If yes, please give a list of the machines which you so pointed out and explained.

Ans. Yes; I pointed out and explained the following Plant machines: —

PLANT MACHINES.

Upper clicking machine.
Double lip channel opener.
Single lip channel opener and edge compressor.
Innersole flexor.
Innersole cloth tucker and lip trimmer.
Sole rounder.
Grinder.
Top-lift compressor.
Puller over and tip measurer.
Rapid side laster.
Staple tacker.
Heel seat nailer.
Welt slasher and groover.
Tack puller and baster.
Welter.

Custom sole layer.
Rough rounder.
Heel seat dinker.
Shoe channeler.
Stitcher.
Leveler.

And the following machines made by the United Shoe Machinery Company: —

UNITED SHOE MACHINERY COMPANY'S MACHINES.

Channeling machine, Goodyear Universal (turn work).
Indenting and burnishing machine, Goodyear welt.
Leveling machine, model B, Hercules.
Loading and attaching machine, model B, McKay automatic heel.
Lockstitch machine, model M, Goodyear out-sole rapid.
Nailing machine, American Lightning.
Pulling-over machine, model B, Rex.
Rounding and channeling machine, model E, Goodyear Universal.
Shoe machine, model K, Goodyear welt and turn.
Wheeling machine No. 2, Goodyear impression stitch.

Int. 12. Please state whether or not Mr. Chapman examined the machines which you pointed out and explained to him, and compared them with any United States Letters Patent.

Ans. He did.

Int. 13. Were you present during the taking of Mr. Chapman's deposition before the examiner?

Ans. I was.

Int. 14. Mr. Chapman referred to the United Shoe Machinery Company's machines with regard to which he testified as having been shown to him by Mr. Warren. Are you the Mr. Warren to whom he referred?

Ans. I am.

Int. 15. Did you show Mr. Chapman the machines with regard to which he testified?

Ans. I did.

Int. 16. Mr. Browne, an expert called on behalf of the defend-

ants, testified that he examined certain machines at the office of the United Shoe Machinery Company, Albany Building, Boston. Were you present when Mr. Browne examined such machines?

Ans. I was.

Int. 17. Please give the official titles of the machines examined by Mr. Browne.

Ans. Lasting and attaching machine, model B, McKay automatic heel.

Nailing machine, American Lightning, No. 3070.

Lockstitch machine, model M, Goodyear outsole rapid, No. 927.

Indenting and burnishing machine, Goodyear welt.

Pulling-over machine, model B, Rex.

Wheeling machine No. 2, Goodyear impression stitch, No. 986.

Int. 18. Please state whether or not these were the same machines that you showed to Mr. Chapman and which he has referred to in his testimony under the same titles.

Ans. They were the same machines.

Int. 19. Have you examined the photographs of the pulling-over machine, model B, Rex, produced by Mr. Browne and offered in evidence as "Defendants' Exhibits Nos. 352" and "353"?

Ans. I have.

Int. 20. Please state whether or not these photographs are photographs of the machine which you showed to Mr. Chapman and which he referred to in his testimony as "Pulling-Over Machine, Model B, Rex".

Ans. One photograph shows pulling-over machine with a shoe in position; the other one, Defendants' Exhibit 352, is the same machine without the shoe. Mr. Chapman saw the machine without the shoe, as shown in Defendants' Exhibit 352. Both photographs show the gaging mechanism which is part of a machine.

Int. 21. Mr. Browne also showed a photograph which was offered in evidence as "Photograph of Loading and Attaching Machine, Model B, McKay Automatic Heel, Defendants' Exhibit 355". Please state whether or not that photograph is a photograph of a machine like loading and attaching machine shown by you to Mr.

Chapman and referred to by him as "Loading and Attaching Machine, Model B, McKay Automatic Heel".

Ans. This photograph, Defendants' Exhibit 355, is a photograph of our commercial loading and attaching machine, model B, McKay automatic heel, and is exactly the same as the machine shown to Mr. Chapman, with the exception that this photograph has a brush for putting oil on the drivers, which was not on the machine shown to Mr. Chapman.

Int. 22. Mr. Browne produced two sheets of drawings of indenting and burnishing machine, Goodyear welt, which were offered in evidence as "Defendants' Exhibit 354". Please state whether or not those drawings correctly represent the indenting and burnishing machine shown to Mr. Chapman, which he referred to in his testimony as "Indenting and Burnishing Machine, Goodyear Welt".

Ans. These drawings correctly represent the machine referred to by Mr. Chapman.

Int. 23. Were you present while Mr. Nelson W. Howard was testifying in this case before the examiner?

Ans. I was.

Int. 24. Have you read the printed record of Mr. Howard's deposition given before the examiner, found on pages 2239 to 2663, inclusive?

Mr. WEBSTER. Objected to as utterly immaterial.

Ans. I have.

Int. 25. Are you familiar with, and can you identify, the machines referred to by him in that portion of his testimony which I have just referred to?

Mr. WEBSTER. Objected to as immaterial.

Ans. I am, and can.

Int. 26. Mr. Howard, at the request of counsel for the petitioner and during the taking of the testimony under the order of the court under which this testimony is taken, produced photographs illustrating a number of machines referred to by him in that portion of his testimony found in the printed record, pages 2239 to 2663, inclusive. Do said photographs illustrate all the machines

referred to by Mr. Howard in the portion of his testimony just referred to?

Mr. WEBSTER. Objected to as utterly immaterial and as not admissible by way of surrebuttal.

Ans. No, sir.

Int. 27. Have you prepared, and can you produce, a collection of photographs illustrating all of the United Shoe Machinery Company's machines referred to by Mr. Howard in his deposition, printed pages 2239 to 2663, inclusive?

Mr. WEBSTER. The same objection repeated.

Ans. I have, and do produce a collection of photographs of United Shoe Machinery Company's commercial machines referred to by Mr. Howard in the portion of his testimony referred to in the question. Some machines referred to by Mr. Howard were obsolete at the time of the filing of the bill herein, and photographs of some of those machines are not in this volume.

Under the name of each machine there is a date given when the machine was first put out by the United Shoe Machinery Company. In some places there are two dates, which indicate that the machine was first put out at the first date, but was replaced on the second date by a later type or model.

An instance of this is channeling machine, Goodyear turn and insole, page 13. These dates are the dates that were stated in Mr. Howard's testimony.

Some of the photographs which show the present commercial machines include many improvements over the machines first put out, as explained in Mr. Howard's testimony. Examples of those machines that have been improved would be lasting machine, Consolidated hand method, McKay, page 29; loading and attaching machine, McKay automatic heel, page 45.

[*The collection of photographs just produced by the witness is offered in evidence as United Shoe Machinery Company's machines referred to in N. W. Howard's deposition, record pages 2239–2663, as "Defendants' Exhibit 356."*]

Mr. WEBSTER. The introduction of the exhibit offered is objected to as inadmissible by way of rebuttal.

Cross Examination by ALLEN WEBSTER, Esq., *of Counsel for* THE UNITED STATES.

Cross-Int. 28. You have testified at some length with reference to your experience concerning stitchers and mechanism employed in the models M and K rapid stitchers for cutting a channel in the welt for producing what is known as a fudge stitch. Will you kindly state whether your experience has been sufficient to give you a knowledge as to what mechanisms were used to produce a like result in stitchers prior to the model M stitcher?

Mr. PHILLIPS. Question objected to as touching upon nothing referred to in the direct examination of this witness, and outside the order of the court.

Mr. WEBSTER. Counsel for complainant respectfully calls attention to the fact that it goes to the witness' experience.

Ans. I am familiar with some of the devices that have been used on other machines for slitting a welt.

Cross-Int. 29. Will you explain how these differ from the construction of the device you have testified to with reference to the model M machine?

Mr. PHILLIPS. Question objected to as touching upon nothing referred to in the direct examination of this witness, and outside the order of the court.

Ans. One device which I am familiar with consists of a stationary knife, and every time the awl feeds the work along the cutting is done by the awl dragging the work against the cutting knife.

Cross-Int. 30. What other one have you knowledge of?

Mr. PHILLIPS. Question objected to as touching upon nothing referred to in the direct examination of this witness, and outside the order of the court.

Ans. Several types, all having a stationary knife, I am familiar with; all applied to the same machine.

Cross-Int. 31. And in such several prior devices to which you have made reference was the whole burden of the work placed on the awl?

Mr. PHILLIPS. Question objected to as touching upon nothing

referred to in the direct examination of this witness, and outside the order of the court.

Ans. If you mean by that the work of cutting a slit, yes.

Cross-Int. 32. And do you say that such channels were never before cut successfully and satisfactorily until the fudge-stitch channel mechanism employed in the model M machine was used?

Mr. PHILLIPS. Question objected to as touching upon nothing referred to in the direct examination of this witness, and outside the order of the court.

Ans. Such mechanisms which I referred to I never saw only on machines which ran at a comparatively low speed; that is, about 375 revolutions per minute, and while they were used successfully, because it was the best thing there was, the device which is now in use on the model M stitcher, running over 500, would have been an improvement even on a machine running at 375.

Cross-Int. 33. Now, as touching the question to which you have referred as to successful operation, for how many years back did the device for cutting the channel operate with the machine which ran, as you say, 375 stitches per minute?

Mr. PHILLIPS. Question objected to as touching upon nothing referred to in the direct examination of this witness, and outside the order of the court.

Ans. I think such devices have been in extensive use since 1907 or 1908.

Cross-Int. 34. Will you kindly state whether the channel-cutting mechanism to which you have testified as applied to rapid stitchers is a permanent part of the machine or fixture to be attached to the machine or detached as desired?

Mr. PHILLIPS. Question objected to as touching upon nothing referred to in the direct examination of this witness, and outside the order of the court.

Ans. The device is incorporated and organized as a part of the machine. Of course, if they do not desire to make a fudge stitch, the knife can be removed, but the rest of the mechanism stays in place.

Cross-Int. 35. Has it, or has it not, been common to provide a

welt with the channel already cut to receive the stitching for the producing of the fudge stitch?

Mr. PHILLIPS. Question objected to as touching upon nothing referred to in the direct examination of this witness, and outside the order of the court.

Ans. You mean before the shoe is presented to the stitching machine?

Cross-Int. 36. Yes.

Ans. I never heard of its being done.

Cross-Int. 37. Will you kindly state whether there was among the machines in the room where the machines were allowed to be examined by defendants' expert a machine having a measuring device or rod thereon similar in appearance to the part marked "109" in Figure 1 of patent to Heys No. 957,955, dated May 17, 1910, a copy of which patent I now hand you?

Ans. There was a machine that had a rod similar to this.

Cross-Int. 38. Is it not a fact that it was practically impossible for Mr. Chapman or anyone else to examine some of the machines pointed out to him by you and obtain a practical knowledge of the operation of the machines because of the fact that the machines were at rest?

Mr. PHILLIPS. Question objected to as calling for mere guess work on the part of the witness as to Mr. Chapman's ability to understand a machine, and as improper cross-examination.

Ans. Some of the machines, for instance model K welter and model M stitcher, Mr. Chapman said he could not quite see the operation of the stop motion, and it was asked by Mr. Chapman if they could not be seen in some factory. I suggested that we go to the factory of George E. Keith, which was nearby, where we could see both machines in operation. I believe Mr. Chapman asked where it was, and I told him in South Boston, and it would take us only a short time to go there; but I heard nothing more in regard to that. One or two of the other machines were very difficult to turn over, and I suggested to Mr. Chapman that I could get a man who would come in and help me move the machine

around so that it could be turned over by hand, but he thought it was hardly worth while.

Cross-Int. 39. Some of the machines pointed out by you to Mr. Chapman were lacking some of their parts, were they not?

Ans. I think there were some. I remember particularly a Plant heel seat dinker, which I explained had some parts missing, but it was a machine with four operating knives when complete, and only one or two of the knives were in commission, so that the machine as a whole had some parts missing.

Cross-Int. 40. Is it not a fact that you found it impossible to operate some of the machines; that is, to turn them over and show the mechanism in operation?

Ans. I did, as explained in my last answer but one, and offered to get a man who would assist me so that they could be operated.

Cross-Int. 41. How about the rough rounder?

Ans. The Plant rough rounder was such a machine.

Cross-Int. 42. You could not make it work, could you?

Ans. Not the particular feature which Mr. Chapman wished to see, but I offered to have a man there the next morning so that I could show the machine in operation, but Mr. Chapman said it would not be necessary.

Cross-Int. 43. There was no shafting or power in the room connected up with the machines, was there?

Ans. No, sir.

Cross-Int. 44. Were any of the photographs in Defendants' Exhibit 356, entitled "United Shoe Machinery Company's Machines referred to in N. W. Howard's Deposition", made from any of the machines in the office building of the United Company where the machines were submitted for inspection of complainant's expert?

Ans. I don't feel sure about that in every case, but I think in nearly all cases they were not made from machines in that room.

Direct Examination resumed by Mr. PHILLIPS.

Int. 45. What machine was it that had the part like the part designated by the reference numeral "109" in Heys patent No. 957,955?

Ans. It was the Plant pulling-over machine.

Int. 46. Referring to heel seat dinker, I believe you stated that it was provided with four sets of cutting mechanisms or knives. Were any of the mechanisms incomplete?

Ans. Yes; one or two of them.

Int. 47. And how did those compare with those which were complete?

Ans. There were parts missing; they were the same as the complete ones, as far as they went.

Int. 48. That is to say, it was a mere duplication of mechanism?

Ans. That is correct.

Int. 49. Referring to the model M stitcher and the model K welter, besides offering to show Mr. Chapman those machines in operation, did you do anything else to enable him to get a full understanding of the construction and mode of operation of said machines?

Ans. I explained them to him as well as I could, and in the case of the model K welter I had all the parts of the stop motion taken apart for his inspection.

Int. 50. From what were the photographs contained in Defendants' Exhibit 356 taken?

Ans. They were taken from machines at the Beverly factory. I do not know that every one of them was, but I think nearly all were.

Int. 51. In so far as the photographs in the collection of photographs referred to bear the titles of the machines stated by you in the lists of machines which were open to the inspection of counsel for the Government and his expert, how do the machines illustrated in these photographs compare with machines referred to by you in said list?

Ans. They are practically the same.

Int. 52. Please state whether or not the photographs in said Defendants' Exhibit 356 are photographs of regular commercial machines put out by the United Shoe Machinery Company.

Mr. WEBSTER. Objected to as leading.

Ans. They are.

Int. 53. Please state whether or not the machines referred to by you in your list as being machines of the United Shoe Machinery Company are regular commercial machines put out by that company.

Ans. They are.

Int. 54. Please state whether or not they are illustrated by photographs contained in the collection which you have produced and which has been offered in evidence as Defendants' Exhibit 356.

Ans. They are.

Cross Examination resumed by Mr. WEBSTER.

Cross-Int. 55. You say that the photographs in Defendants' Exhibit 356 are photographs of commercial machines; please state when these photographs were made.

Ans. I don't know in every case when they were made. Some of them were made quite recently.

Cross-Int. 56. Then you were not present when the exposures for the photographs were made?

Ans. I was not.

Cross-Int. 57. Then you have no knowledge as to when the photographs were in fact made?

Ans. No; I did not see them made.

Cross-Int. 58. You have testified that you took apart the parts of the stop-motion mechanism of the welter and showed the same to Mr. Chapman; is it not a fact that you at the same time, or substantially the same time, while explaining these machines stated that the machines did not contain the so-called Plant stop-motion mechanism?

Mr. PHILLIPS. Question objected to as outside the order of the court and as bearing on nothing referred to either in the direct or redirect examination of this witness.

Ans. I don't remember saying whether it embodied the Plant stop motion or not. I simply described the mechanism in that machine.

Cross-Int. 59. Did you not at that time point out that the stop-

ping mechanism was operated, in both the welter and stitcher, by an independent driving mechanism?

Ans. I stated that there was a constantly running member in both of the stop motions.

Cross-Int. 60. Did you not state it was entirely independent of the driving mechanism?

Ans. I stated that there was a constantly running member in both of the stop motions.

Cross-Int. 61. Did you not state it was entirely independent of the driving mechanism of the machine?

Ans. It was driven entirely independent.

Cross-Int. 62. And did you not state there was no spring mechanism incorporated therein to bring about the reverse motion?

Mr. PHILLIPS. This line of examination is objected to on the ground that it refers to nothing in the direct or redirect examination of this witness.

Ans. I don't remember what I stated, but in looking at the parts, after it was taken apart, it could be easily seen that there was no spring arrangement such as you refer to.

Cross-Int. 63. Is it not a fact that some of the machines pointed out by you were stated by you as being obsolete and inoperative?

Mr. PHILLIPS. This line of examination is objected to on the ground that it refers to nothing in the direct or redirect examination of this witness.

Ans. You mean the Plant machines, or the United Shoe Machinery Company's machines?

Cross-Int. 64. Any of them?

Mr. PHILLIPS. This line of examination is objected to on the ground that it refers to nothing in the direct or redirect examination of this witness.

Ans. I did state that some of the Plant machines were not commercial.

Direct Examination resumed by Mr. PHILLIPS.

Int. 65. Will you please give the titles of the photographs in Defendants' Exhibit 356 which illustrate the United Company's machines which were submitted to counsel for the Government and

his expert for examination, as stated in the lists heretofore given by you, and the number of the several pages on which such photographs are found in said exhibit?

Mr. WEBSTER. Objected to as not admissible under redirect examination.

Ans. Lockstitch machine, model M, Goodyear outsole rapid . . . . . page 47
Shoe machine, model K, Goodyear welt and turn . page 78
Channeling machine, Goodyear Universal (turn work) page 14
Grooving and beveling machine, Goodyear power welt . . . . . page 24
Indenting and burnishing machine, Goodyear welt . page 25
Lasting machine No. 5, U. S. M. Co. . . . . page 34
Leveling machine, model B, Hercules . . . page 43
Loading and attaching machine, McKay automatic heel page 45
Nailing machine, American Lightning . . . page 53
Pulling-over machine, model B, Rex . . . page 64
Rounding and channeling machine, model E, Goodyear Universal . . . . . page 72
Wheeling machine No. 2, Goodyear impression stitch, page 105
Rounding machine, Goodyear heel seat . . . page 73

[*The signature of the witness is waived.*]

Attest: CHARLES K. DARLING, *Special Examiner.*

[*Adjourned subject to call.*]

BOSTON, MASS., March 24, 1914.

Mr. PHILLIPS. For the convenience of the Court, counsel for defendants offers in evidence two volumes of patents identified in Defendants' Exhibit 341 [*Exhibit 341 introduced in evidence page 4944 printed record*], and said volumes are marked "Volume 1, Patents named in Defendants' Exhibit 341, Defendants' Exhibit 357"; and "Volume 2, Patents named in Defendants' Exhibit 341, Defendants' Exhibit 358".

Defendants' counsel also offers in evidence in one volume the patents identified in Defendants' Exhibit 342 [*Defendants' Exhibit 342 offered in evidence page 4944 printed record*], and said vol-

ume is marked "Volume of Patents named in Defendants' Exhibit 342, Defendants' Exhibit 359".

So far as at present advised, the defendants have no further testimony to offer before the examiner.

Mr. WEBSTER. Now comes counsel for the complainant and moves that depositions taken in its behalf not already filed, be filed by the examiner with the clerk, so that such depositions may become a part of the record in this cause.

[*Adjourned.*]

District Court of the United States,

DISTRICT OF MASSACHUSETTS.

IN EQUITY.

No. 301 (C. C. 911).

UNITED STATES OF AMERICA

v.

UNITED SHOE MACHINERY COMPANY, OF NEW JERSEY, ET AL.

EXHIBITS FOR THE UNITED STATES OF AMERICA.

PLAINTIFF'S EXHIBIT 1.

[Put in Evidence, page 312.]

(10c. Internal Revenue Stamp cancelled.)

UNITED SHOE MACHINERY COMPANY. CERTIFICATE OF INCORPORATION.

First: The name of the corporation is United Shoe Machinery Company.

Second: The location of its principal office in the State of New Jersey is at No. 152 Market Street, in the City of Paterson, County of Passaic.

The name of the agent therein and in charge thereof, upon whom process against this corporation may be served, is The Paterson Safe Deposit and Trust Company.

Third: The objects for which, and for any of which, this corporation is formed are to do any or all of the things herein set forth, to the same extent as natural persons might or could do the same, and in any part of the world, namely:

To manufacture, buy, sell, lease, operate and deal in and with

all kinds of machinery, tools and implements, and mechanical devices and contrivances of every name and nature whatsoever, and especially to manufacture, buy, sell, lease, operate and deal in and with all sorts of boot and shoe machinery and every kind of mechanism, contrivance, implement, tool, material or thing in any way whatsoever connected with, or useful in connection with the manufacture of boots, shoes and footwear, or the manufacture of leather and rubber goods, or goods made from materials and fabrics of any description whatsoever, or useful in connection with the manufacture or operation of any of the machinery, mechanical devices or contrivances hereinbefore mentioned; to produce, prepare and manufacture, buy, sell and deal in and with leather and rubber, and materials and fabrics of all sorts, and the raw materials from which said leather, rubber materials or fabrics are produced; to manufacture, buy, sell and deal in and with boots, shoes and footwear and all articles and things of every description that may be produced or manufactured, in whole or in part, from leather, rubber or any other materials or fabrics; and in general to produce, prepare, manufacture and deal in and with goods, wares, merchandise, property, materials and things of every class and description.

To purchase, acquire, erect, establish, hold and dispose of manufactories, workshops, plants and buildings of every description, and to fully equip the same with a view to carrying out the purposes herein set forth, or any of them.

To purchase, lease or otherwise acquire, and to sell, let, mortgage, or otherwise dispose of, to the same extent that a natural person might do, lands, buildings and all sorts of property, both real and personal, within or without the State of New Jersey, and in any part of the world.

To apply for, obtain, register, purchase, lease, or otherwise acquire, and to hold, own, use, operate, sell, assign or otherwise dispose of any and all trade-marks, trade-names and distinctive marks, copyrights and patent rights, and all inventions, improvements and processes used in connection with or secured under Letters Patent of the United States or elsewhere, or otherwise, and

to use, exercise, develop, grant licenses in respect of, or otherwise turn to account any such trade-marks, patents, licenses, concessions, processes and the like, or any such property, rights and information so acquired, and, with a view to the working and development of the same, to carry on any legal business whatsoever, whether manufacturing or otherwise, which the corporation may deem calculated, directly or indirectly, to accomplish these objects, or any of them.

To acquire the good-will, rights, stock and property of all kinds, and to undertake the whole or any part of the assets and liabilities of any person, firm, association or corporation, and to pay for the same in cash, stock of this corporation, bonds, or otherwise.

To issue from time to time, so far as may be convenient for the accomplishment of the purposes, or any of them, herein contained, bonds of the corporation to such amount, in such denomination and on such terms as the Board of Directors may determine, and, if desired, to secure the same by pledge or mortgage of any or all of its property, and, if deemed advisable, by mortgage of the franchises of the company, in such manner as may be allowed by law.

To hold, purchase, or otherwise acquire and invest in, sell, assign and transfer, mortgage, pledge, guarantee, or otherwise dispose of shares of the capital stock, bonds, debentures, or other evidences of indebtedness created by any other corporation or corporations; and, while the holder of such stock, bonds and debentures, to exercise all the rights and privileges of ownership, including the right to vote thereon, to the same extent as a natural person might or could do.

To make and enter into contracts of every sort and kind with any individual, firm, association, corporation — private, public or municipal — and with the Government of the United States, of any state, territory or colony thereof, or any foreign government.

To carry on any other business, and to do any and all other things which may seem to the company capable of being conveniently carried on or done in connection with the objects hereinbefore set forth, or any of them, or calculated, directly or indirectly, to develop the company's business, or to enhance the

value of the company's property or rights; and to do all or any of the above things within or without the State of New Jersey, and in any part of the world, as principals, agents, contractors, trustees, or otherwise, and by or through trustees, agents or otherwise, and either alone or in conjunction with other individuals, firms, associations or corporations.

It is intended that the objects specified and clauses contained in this third paragraph shall, except where otherwise expressed in said paragraph, be nowise limited or restricted by reference to, or inference from the terms of any other clause of this, or any other paragraph in this charter, but that the objects specified in each of the clauses of said third paragraph shall be regarded as independent objects, and shall further be regarded as in furtherance of and not in limitation of the general powers conferred by the laws of the State of New Jersey.

Fourth: The total amount of the capital stock of said corporation is to be twenty-five million dollars ($25,000,000), divided into one million (1,000,000) shares, with a par value of twenty-five dollars ($25) each. Of said capital stock, five hundred thousand (500,000) shares, amounting at par to twelve million five hundred thousand dollars ($12,500,000), are to be preferred stock, and five hundred thousand (500,000) shares, amounting at par to twelve million five hundred thousand dollars ($12,500,000), are to be common stock.

From time to time, the preferred stock and the common stock shall be issued in such amounts and proportion as shall be determined by the Board of Directors, and as may be permitted by law.

The rights, privileges and conditions following shall attach to the shares aforesaid, that is to say:

The preferred stock shall be entitled, out of the surplus net earnings, after all amounts which may be determined upon have been reserved as working capital, to a fixed cumulative preferential dividend at the rate of, but never exceeding, six per cent. per annum on the par value of said stock, and such dividends shall be declared in January of each year, unless some specified day or days for that purpose be fixed by the by-laws. If, in any year,

dividends amounting to six per cent. per annum, shall not be paid on such preferred stock, the deficiency shall be a charge on said net earnings over and above the amount reserved as working capital, and be payable, but without interest, before any dividends shall be paid upon or set apart for the common stock. In the event of the dissolution of the corporation, or the distribution of its assets, the holders of the preferred stock and the holders of the common stock shall share and share alike.

The common stock shall be subject to the prior rights of the preferred stock, as herein declared, but the shares of preferred and common stock shall have equal voting power.

If, after appropriating the accumulated profits of the company, in excess of the amount reserved as working capital, to such dividends on the preferred stock of the company as may be required, there remain further accumulated profits, over and above the amount reserved as working capital, the Directors shall, in January of each year, unless some specific day or days for that purpose be fixed in the by-laws, declare a dividend of said profits on the common stock.

Fifth: The names and the post-office address of the incorporators, and the number of shares of the common stock subscribed for by each, the aggregate of which being three thousand (3,000) dollars, is the amount of capital stock with which the corporation shall commence business, are as follows:

Names.	P. O. Address.	No. of Shares of Common Stock.
J. Wilson Smyth,	14 Hill St., Newark, N. J.	Forty shares
Robert Miller,	Main St., Paterson, N. J.	Forty shares
John S. Tylee,	VanHouten St., Paterson, N. J.,	Forty shares

Sixth: The duration of the corporation is to be perpetual and unlimited.

Seventh: The property and business of the corporation shall be managed by a Board of Directors, who shall have power, among other things, without the assent or vote of the stockholders, to make, alter, amend and rescind the by-laws of this corporation; to fix the amount to be reserved as working capital; to authorize and

POOR COPY

cause to be executed mortgages and liens upon the real and personal property of the corporation, to issue bonds of the corporation, and, if deemed advisable, to secure the same, and, from time to time, to sell, assign, transfer or otherwise dispose of any or all of the property of the corporation, but no such sale of all the property shall be made, except pursuant to a vote of at least two-thirds of the Board of Directors.

The corporation may use and apply its surplus earnings or accumulated profits, authorized by law to be reserved, to the purchase or acquisition of property, and to the purchase or acquisition of its own capital stock, from time to time, to such extent and in such manner and upon such terms as its Board of Directors shall determine. And neither the property nor the capital stock so purchased and acquired, nor any of its capital stock taken in payment or satisfaction of any debt due to the corporation, shall be regarded as profits for the purposes of declaration or payment of dividends, unless otherwise determined by the Board of Directors.

The Board of Directors may from time to time sell, assign, transfer or otherwise dispose of any or all of the property or the capital stock so purchased and acquired, and may reinvest or reserve the proceeds thereof as working capital.

The corporation, in its by-laws, may prescribe the number necessary to constitute a quorum of the Board of Directors, which number may be less than a majority of the whole number; and, by vote of the Board of Directors, the number of Directors may at any time be increased or altered, and, in case of such increase, the Board of Directors shall have power to elect additional Directors to fill the directorships created by such increase, such additional Directors to hold office until the next annual meeting of the stockholders, or until their successors shall be elected.

The Board of Directors, by resolution passed by a majority of the whole Board, may designate three or more Directors to constitute an Executive Committee, which Committee, to the extent provided in said resolution, or in the by-laws of the corporation, shall have and may exercise the power of the Board of Directors in the management of the business and affairs of the corporation, and

shall have power to authorize the seal of the corporation to be affixed to all papers which may require it.

The Board of Directors from time to time shall determine whether and to what extent, and at what times and places, and under what conditions and regulations, the accounts and books of the corporation, or any of them, shall be open to the inspection of the stockholders; and no stockholder shall have the right of inspecting any account, or book, or document of the corporation, except as conferred by statute, or authorized by the Board of Directors, or by a resolution of the stockholders.

The Board of Directors shall have power to hold its meetings, to have one or more offices, and to keep the books of the corporation (except the stock and transfer books) outside of this State, at such places as may be from time to time designated by them.

We, the undersigned, for the purpose of forming a corporation in pursuance of an Act of the Legislature of the State of New Jersey, entitled "An Act Concerning Corporations" (Revision of 1896) and the various acts amendatory thereof and supplemental thereto, do associate ourselves into a corporation, and do make, record and file this certificate, and do respectively agree to take the number of shares of stock hereinbefore set forth, and accordingly hereunto have set our hands and seals.

Dated at Paterson aforesaid this seventh day of February, 1899.

J. WILSON SMYTH [L. S.]
ROBERT MILLER [L. S.]
JOHN S. TYLEE [L. S.]

In presence of:
Wm. I. Lewis.

State of New Jersey
County of Passaic ss

Be it remembered that on this seventh day of February, A. D. eighteen hundred and ninety-nine, before the undersigned personally appeared J. Wilson Smyth, Robert Miller and John S. Tylee, who, I am satisfied, are the persons named in and who executed the foregoing certificate, and, I having first made known to them, and each of them, the contents thereof, they did each acknowledge that

POOR COPY

they signed, sealed and delivered the same as their voluntary act and deed.

WM. I. LEWIS,
A Master in Chancery of New Jersey.

[Endorsed:]

"Received in the Clerk's Office of the County of Passaic on the 7th day of Feby A. D., 1899, at o'clock, in the noon, and recorded in Book G of Certificates for said County, on pages 308, &c.

A. D. WINFIELD, Clerk.

"Filed Feb 7 1899 George Wurts Secretary of State."

STATE OF NEW JERSEY.
Department of State.

I, S. D. Dickinson, Secretary of State of the State of New Jersey, do hereby certify that the foregoing is a true copy of the certificate of incorporation of United Shoe Machinery Company, and the endorsements thereon, as the same is taken from and compared with the original filed in my office on the Seventh day of February A. D. 1899, and now remaining on file and of record therein.

In testimony whereof, I have hereunto set my hand and affixed my Official Seal at Trenton, this Eleventh day of August A. D. 1911.

S. D. DICKINSON
Secretary of State.

[SEAL]

[Endorsed:]

Certified Copy of Certificate of Incorporation of United Shoe Machinery Company.

PLAINTIFF'S EXHIBIT 2.

[Put in Evidence, page 312.]

State of New Jersey, ss:

We, the undersigned, in order to form a corporation for the purposes hereinafter stated under and pursuant to the provisions of the Act of the Legislature of the State of New Jersey entitled "An Act Concerning Corporations (Revision of 1896)" and the Acts amendatory thereof and supplemental thereto, do hereby certify as follows: —

First. The name of the corporation is "United Shoe Machinery Corporation".

Second. The location of its principal office in this State is at Number 152 Market Street, in the City of Paterson, and County of Passaic. The name of the agent therein and in charge thereof upon whom process against this corporation may be served is The Paterson Safe Deposit and Trust Company.

Third. The objects for which the corporation is formed are: —

To manufacture, buy, sell, lease, operate and deal in and with all kinds of machinery, tools, and implements, and mechanical devices and contrivances of every name and nature whatsoever, and especially to manufacture, buy, sell, lease, operate and deal in and with all sorts of boot and shoe machinery, lasts, trees, forms, and every kind of mechanism, contrivance, implement, tool, material, or thing in any way whatsoever connected with, or useful in connection with the manufacture of boots, shoes and footwear, or the manufacture of leather and rubber goods, or goods made from materials and fabrics of any description whatsoever, or useful in connection with the manufacture or operation of any of the machinery, mechanical devices or contrivances hereinbefore mentioned; to produce, prepare and manufacture, buy, sell and deal in and with leather and rubber, and materials and fabrics of all sorts, and the raw materials from which said leather, rubber materials or fabrics are produced; to manufacture, buy, sell and deal in and with boots, shoes and footwear and all articles and things of every description that may be produced or manufactured, in whole or in

POOR COPY

part, from leather, rubber or any other materials or fabrics; and in general to produce, prepare, manufacture and deal in and with goods, wares, merchandise, property, materials and things of every class and description.

To carry on the business of manufacturers of and dealers in all kinds of eyelets, hooks, buttons, studs, nails, wires, rivets, tacks, metallic and other plates, metallic, wood and other fastenings, laces, cloth, linen, tape and other fabrics, brushes, abrasive materials, cements, dressings, stains, blackings and other requisites for the improvement and treatment of boots and shoes, threads, elastic material, buttons and inner soles, and other articles or substances for protecting feet from damp or heat, and other articles or substances used in connection with the manufacture of boots and shoes, corsets, stationery, sails, tents, clothing and for analogous purposes, and to carry on the business of manufacturers of and dealers in all kinds of appliances, devices, findings, tools, mechanisms, accessories, processes and things which may be used or useful in connection with the manufacture or treatment of any of the above named articles or substances.

To acquire, own, lease, occupy, use or develop any lands, containing coal, metals, or minerals, or other ores, or oil, which shall be useful or convenient in carrying on said business. To mine or otherwise extract or remove and deal in coal, ores, minerals, or timber from any lands owned, acquired, leased or occupied by the company.

To purchase, acquire, erect, establish, hold and dispose of manufactories, workshops, plants, and buildings of every description, and to fully equip the same with the view of carrying out the purposes herein set forth or any of them; to purchase, lease or otherwise acquire, hold and dispose of in any manner lawful for individuals, lands, buildings, houses for employees, and all sorts of property both real and personal, within or without the State of New Jersey or in any part of the world, which shall be necessary or convenient for carrying out the purposes herein set forth or any of them.

In connection with and in furtherance of the general business of

the company, to lay out lands for building purposes and to build on, improve, let on building lease, advance money to persons building thereon or otherwise develop the same in such manner as may seem expedient to advance the company's interest.

To construct bridges, buildings, machinery, shops, boats, engines, cars and other equipment, railroads, docks, slips, elevators, waterworks, gas works and electric works, viaducts, aqueducts, canals and other waterways, and any other means of transportation, and to sell or otherwise dispose of the same, or to maintain or operate the same but not to maintain or operate any railroad or canal in the State of New Jersey.

To apply for, obtain, register, purchase, lease or otherwise acquire, and to hold, own, use, operate, introduce, sell, assign or otherwise dispose of any and all trade-marks, trade-names and distinctive marks, copyrights, patents and patent rights, and all inventions, improvements and processes used in connection with or secured under Letters Patent of the United States or elsewhere, or otherwise, and to use, exercise, develop, grant licenses in respect of, or otherwise turn to account any such trade-marks, patents, licenses, concessions, processes and the like, or any such property, rights and information so acquired, and, with a view to the working and development of the same, to carry on any legal business whatsoever, whether manufacturing or otherwise, which the corporation may deem calculated, directly or indirectly, to accomplish these objects or any of them.

To acquire the good-will, rights, stock and property of all kinds, and to undertake the whole or any part of the assets and liabilities of any person, firm, association or corporation, carrying on any business which this corporation is authorized to carry on, and to pay for the same in cash, shares of stock of this corporation, bonds or otherwise.

To purchase, acquire by subscription or otherwise, and to hold for investment or otherwise, use, sell, assign, transfer, mortgage, pledge, or otherwise dispose of and to guarantee any shares of stock, bonds, securities, or other obligations of any other corporation or association carrying on any business which this corpora-

POOR COPY

tion is authorized to carry on; to aid in any manner any such corporation or association whose shares of stock, bonds or other obligations are held or in any manner guaranteed by the company, and to do any other act or things now or hereafter permitted by law for the preservation, protection, improvement, or enhancement of the value of such shares of stock, bonds, securities or other obligations, and to do any acts or things permitted by law designed for any such purpose; and while owner of any such shares of stock, bonds, securities or other obligations, to exercise all the rights, powers and privileges of ownership thereof, and to exercise any and all voting powers thereon to the same extent as a natural person might or could do.

To enter into partnership or into any arrangement for sharing profits, union of interest, joint adventure or co-operation with any person, partnership, association or corporation carrying on or engaged in any business which this corporation is authorized to carry on or engage in.

To establish and support, or to aid in the establishment and support of associations, institutions or conveniences calculated to benefit employees or ex-employees of the company, or any of its predecessors in business, or the dependents or connections of such persons, and to grant pensions and allowances, and to make payments towards insurance, and to subscribe or guarantee money for charitable or benevolent objects, or for any exhibition, or for any public, general or useful object.

To issue from time to time, when and as may be convenient for the accomplishment of the purposes or any of them herein set forth, bonds and other securities, or obligations of the corporation to such amount and in such denomination and on such terms as the Board of Directors shall determine; and, when authorized by the stockholders as hereinafter provided, to pledge, mortgage or convey in trust any and all shares of stock, bonds, securities, obligations or other property of the corporation, to secure any bonds, securities or other obligations so issued.

To make, enter into and guarantee contracts of every sort and kind with any individual, firm, association, corporation — private,

public or municipal, — or with the government of the United States of America, or of any State, Territory or Colony thereof, or any foreign government, for the purpose of attaining or furthering any of the purposes herein set forth; and to carry on any other business and to do any and all other acts which may seem to the corporation capable of being conveniently carried on or done in connection with the purposes herein set forth or any of them or calculated directly or indirectly to develop the business of the corporation, or enhance the value of the property or rights of the corporation, and to do any or all of the above things within or without the State of New Jersey, or in any part of the world as principals, agents, contractors, trustees, guarantors or otherwise, or by or through trustees, agents or otherwise, and either alone or in conjunction with other individuals, firms, associations or corporations, and to exercise any and all other powers for the accomplishment and furtherance of the purposes herein set forth, which a copartnership or natural person could do or exercise, and which now is or hereafter shall be authorized or permitted by law.

To use and apply from time to time its surplus or net profits arising from its business to the purchase or acquisition of its bonds, securities or other obligations or shares in its own capital stock, to such extent and in such manner and upon such terms as the Board of Directors shall determine; and from time to time to accept as security for, or in payment on account of or in satisfaction of any claim or demand of the corporation, shares in its own capital stock on such terms as the Board of Directors may determine.

To do all and everything necessary or convenient for the accomplishment of the purposes, objects and powers above-mentioned, or incidental thereto, and to conduct its business, or do anything which it is authorized to do, in every State and in the Territories and Colonies of the United States of America and in foreign countries, and to have one office or more than one office, and to keep the books of the corporation outside of the State of New Jersey, except as otherwise may be provided by law; and to hold, purchase, mortgage and convey real and personal property either in or out of the State of New Jersey, but not to engage in any business

hereunder which shall require the exercise of the right of eminent domain within the State of New Jersey or which is prohibited to corporations formed under the statutory provisions aforesaid.

It is declared that the objects and powers specified, and the clauses contained in this paragraph "Third", shall be in no wise limited or restricted by reference to or inference from the terms of any other clause of this or any other paragraph in this certificate.

Fourth: The total amount of the authorized capital stock of the corporation is Fifty Million Dollars ($50,000,000.) divided into two million (2,000,000) shares of the par value of Twenty-five Dollars ($25.00) each. Of such authorized capital stock, Six Hundred Thousand (600,000) shares, amounting at par to Fifteen Million Dollars ($15,000,000.) shall be preferred stock, and One Million Four Hundred Thousand (1,400,000) shares amounting at par to Thirty-five Million Dollars ($35,000,000.) shall be common stock. The amount of the capital stock with which the corporation shall commence business is Thirty Thousand Dollars ($30,000.).

From time to time the amount of the capital stock hereby authorized may be increased according to law and as provided in this certificate, and the preferred and common stock, hereby authorized, and all capital stock which shall hereafter be authorized, may be issued from time to time by the Board of Directors, in such amounts and proportions and for such considerations as shall from time to time be determined by the Board of Directors and as shall be permitted by this certificate and by law.

The rights, privileges and conditions following shall attach to the shares aforesaid:

The holders of the preferred stock shall be entitled to receive, when and as declared by the Board of Directors, from the surplus or net profits arising from the business of the corporation, after all amounts which shall have been determined upon by the Board of Directors shall have been reserved as working capital, cumulative dividends at the rate of, but never exceeding, six per cent. (6%) per annum, payable quarterly on dates to be fixed by the by-laws or by the Board of Directors, in preference and priority to the declaration or payment of any dividend on the common stock.

Shares of preferred stock issued between the dates fixed for the payment of dividends shall be entitled at the next dividend date to a dividend at the rate aforesaid from the date of issue.

In the event of any liquidation or dissolution or winding up (whether voluntary or involuntary) of the corporation, the holders of the preferred stock shall be entitled to be paid thirty-five dollars ($35) per share and the unpaid dividends accrued thereon, out of the capital of the corporation or the proceeds thereof before any amount shall be paid therefrom to the holders of the common stock; and after the payment to the holders of the preferred stock of the sum of thirty-five dollars in respect to each share thereof and the accrued dividends thereon, the remaining assets and funds of the corporation shall be divided and paid to the holders of the common stock according to their respective shares.

The holders of the preferred stock shall not be entitled to any other or further share in the surplus or net profits of the corporation, nor shall they be entitled to any other or further payment or distributive share in the capital of the corporation in the event of liquidation, dissolution or winding up, than as above provided, nor shall they be entitled in any event to any right to subscribe to, or to take, or to receive any preferred or common stock of the corporation, which is hereby authorized or preferred, common or other stock which shall be hereafter authorized, whether the preferred, common or other stock now or hereafter authorized shall be issued for cash at prices at or above par to be determined by the Board of Directors, or in or on account of payment for property purchased, or by way of stock dividends, or by way of capitalization of the surplus or net profits, or however otherwise lawfully issued.

If, in respect to any quarterly dividend period, a dividend at the rate of six per cent. per annum upon the par value of the preferred stock shall not be declared and paid the deficiency shall be a charge on the surplus or net profits arising from the business of the corporation over and above the amount which the Board of Directors shall have reserved as working capital, and shall be payable, but without interest, before any dividends shall be declared or paid in respect to the common stock.

So long as dividends on the preferred stock shall be paid quarterly as aforesaid, the holders of the preferred stock shall have no voting power on any question as to the increase of the authorized capital stock by additional common stock, or by any stock deferred to the preferred stock in respect to dividends and lien upon the capital of the corporation; but should any dividend on the preferred stock be not declared and paid, when payable as above provided, and remain so unpaid for a period of three months, then and so long as such dividend or any part thereof, remains unpaid by reason of any default or neglect of the corporation, the holders of the preferred stock entitled to such unpaid dividend or part thereof, shall be entitled to the same voting powers thereon as belong to the holders of common stock, but upon the payment of such unpaid dividend or part thereof, the voting power upon said preferred stock shall again cease as aforesaid, and so on from time to time as long as any dividend or part thereof upon the preferred stock shall remain unpaid for three months after the same has become payable as above provided. Upon all other questions, and, in particular, upon questions relating to the increase or decrease of the authorized preferred stock, the holders of the preferred stock and the holders of the common stock shall at all times have equal voting powers.

Whenever all cumulative dividends on the preferred stock for all previous years shall have been declared and shall have become payable, and the accrued quarterly instalments for the current year shall have been declared, and the corporation shall have paid such cumulative dividends for previous years, and such accrued quarterly instalments, or shall have set aside from its surplus or net profits a sum sufficient for the payment thereof, the Board of Directors may declare dividends on the common stock, payable then or thereafter, out of any remaining surplus or net profits.

Fifth. The names and Post Office addresses of the undersigned incorporators and the number of shares of stock for which severally and respectively we do here subscribe (the aggregate of our subscription being thirty thousand dollars ($30,000), is the amount

of the capital stock with which the corporation will commence business) are as follows: —

Name.	Post Office Address.	Number of Shares. Common Stock.	Preferred Stock.
John Reynolds	Paterson, N. J.	400	
William Berdan	" "	400	
Frank Gledhill	" "	400	

Sixth. The duration of the corporation shall be perpetual.

Seventh. The first Board of Directors of the corporation shall consist of three persons to be elected by the stockholders at their first meeting. Thereafter the number to constitute the Board shall be fixed from time to time by the by-laws or by the Board of Directors.

The Board of Directors shall have the management and entire control of all the property and business affairs of the corporation, and, for that purpose, they shall have and exercise all the powers of the corporation which are not reserved to the stockholders by this certificate or by the laws of the State of New Jersey, now or hereafter in force.

Among all other powers which may be exercised by the Board of Directors, the Board shall, subject to by-laws made by the stockholders, have full power with respect to the following: —

1. To make by-laws and from time to time to alter, amend and repeal any by-laws, but any by-laws made by the Board of Directors may be altered or repealed by the stockholders at any annual meeting, or at any special meeting, provided notice of such proposed alteration or repeal be included in the notice of the meeting.

2. To prescribe the number necessary to constitute a quorum of the Board of Directors, which number may be less than a majority of the whole number; and, by vote of the Board of Directors, the number of Directors may at any time be increased or altered, and, in case of such increase, the Board of Directors shall have the power to elect additional Directors to fill the directorships created by such increase, such additional Directors to hold office until the next annual meeting of the stockholders, or until their successors shall have been elected and qualified. In case of any vacancy

among the Directors through death, resignation, disqualification or other cause, the Directors remaining in office may elect a successor Director to hold office for the unexpired portion of the term of the Director whose office shall have become vacant and until the election and qualification of a successor.

3. By the affirmative vote of a majority of the whole Board, to designate three or more Directors to constitute an Executive Committee, and to determine what number thereof shall constitute a quorum, which Committee, to the extent provided in said vote, or in the by-laws of the corporation, shall have and may exercise the powers of the Board of Directors in the management of the business and affairs of the corporation, including power to authorize the seal of the corporation to be affixed to all papers which may require it.

4. By the affirmative vote of a majority of the whole Board, to appoint other standing committees, and such standing committees shall have and may exercise such powers as shall be conferred upon them or authorized by the by-laws or by the votes appointing them.

5. To elect or appoint one or more Vice Presidents, one or more Assistant Treasurers, and one or more Assistant Secretaries; and to the extent provided in the by-laws the persons so appointed respectively shall have and may exercise all the powers of the President, of the Treasurer, and of the Secretary respectively, to elect, appoint, and at their discretion remove, all officers and committees; to employ and remove at their pleasure managers, agents, clerks and workmen; to fix the compensation of all officers and employees, and to require of them security for the faithful performance of their respective duties; and to confer by vote or resolution upon any officer or committee, the right to appoint and remove at pleasure all officers, managers, agents, clerks and workmen, except the President, the Vice President, the Treasurer and the Secretary.

6. To fix and determine and to vary the amount to be reserved as working capital from time to time; to issue bonds, debentures, notes, or other obligations or evidences of the debt of the corporation; and from time to time, to sell, assign, transfer or otherwise

dispose of any or all property of the corporation; but no such sale of all the property shall be made except pursuant to a vote of at least two-thirds of the Board of Directors.

7. To declare and pay dividends, but only from the surplus or from the net profits arising from the business of the corporation, after deducting therefrom the amount, at the time when any dividend is declared, which shall have been reserved by the Directors as working capital.

8. To use and apply from time to time the surplns or net profits arising from the business of the corporation, to the purchase or acquisition of property and to the purchase or acquisition of its bonds, securities or other obligations or shares of its own capital stock, to such extent and in such manner and upon such terms as the Board of Directors shall determine; to sell, assign, transfer or otherwise dispose of from time to time any or all of the property, obligations or shares of stock so purchased or acquired, unless such shares shall have been retired for the purpose of decreasing the corporation's capital stock, as provided by law; and to reinvest or reserve the proceeds thereof as working capital, or dispose of the same as surplus or net profits of the corporation.

9. To hold meetings of the Board of Directors, to have one or more offices, and to keep the books of the corporation, except the stock and transfer books outside of the State of New Jersey at such places as the Board shall from time to time designate.

10. To determine from time to time, by the by-laws or by vote, whether and to what extent, and at what times and places, and under what conditions and regulations, the accounts and books of the corporation, or any of them, shall be open to the inspection of the stockholders; and no stockholder shall have the right of inspecting any account, or book, or document of the corporation, except as conferred by statute, or authorized by the Board of Directors, or by a resolution of the stockholders.

Unless authorized by votes given in person or by proxy by stockholders holding at least two-thirds of the capital stock of the corporation, which is represented and voted upon in person or by proxy at a meeting specially called for that purpose, or at an

annual meeting, the Board of Directors shall not mortgage or pledge any of its real property, or any shares of the capital stock of any other corporation; but this prohibition shall not be construed to apply to the execution of any purchase-money mortgage or any other purchase-money lien.

As authorized by the Act of the Legislature of the State of New Jersey, passed March 22, 1901, amending the seventeenth section of "Act concerning Corporations (Revision of 1896)" any action which theretofore required the consent of the holder of two thirds of the stock at any meeting, after notice to them given, or required their consent in writing to be filed, may be taken upon the consent of, and the consent given and filed by the holders of two-thirds of the stock of each class represented at such meeting in person or by proxy.

The corporation reserves the right to amend, alter or repeal any provision contained in this Certificate of Incorporation in the manner now or hereafter prescribed by statute, and all rights conferred on stockholders herein are granted subject to this reservation, except that there shall be no change in the per centum or cumulation of quarterly dividends upon the preferred stock, or of the lien of the preferred stock upon the capital of the corporation in case of liquidation, dissolution or winding up.

In witness whereof the undersigned have hereto set their hands and seals the first day of May A. D. One Thousand Nine Hundred and Five.

JOHN REYNOLDS [L. S.]
WM. BERDAN [L. S.]
FRANK GLEDHILL [L. S.]

Signed, Sealed and Delivered in the presence of
John W. Griggs

State of New Jersey
County of Passaic, ss.

Be it remembered That on this first day of May A. D. Nineteen Hundred and Five before the undersigned, personally appeared John Reynolds, William Berdan and Frank Gledhill who I am sat-

isfied are the persons named in and who executed the foregoing certificate, and I having first made known to them and each of them the contents thereof, they did each acknowledge that they signed and delivered the same as their voluntary act and deed.

JOHN W. GRIGGS
A Master in Chancery of New Jersey.

Received in the Clerk's Office of the County of Passaic on the First day of May A. D. 1905, at 4.15 o'clock in the afternoon, and recorded in book "O" of Certificates for said County on pages

JNO. J. SLATER, Clerk.

[Endorsed:]

"Filed and recorded May 2 1905 S. D. Dickinson Secretary of State."

STATE OF NEW JERSEY.
Department of State.

I, S. D. Dickinson, Secretary of State of the State of New Jersey, do hereby certify that the foregoing is a true copy of the certificate of incorporation of "United Shoe Machinery Corporation", and the endorsements thereon, as the same is taken from and compared with the original filed in my office on the second day of May A. D. 1905, and now remaining on file and of record therein.

In testimony whereof, I have hereunto set my hand and affixed my official seal at Trenton, this eleventh day of August A. D. 1911.

S. D. DICKINSON
[SEAL] Secretary of State.

[Endorsed:]
Certified Copy of Certificate of Incorporation of "United Shoe Machinery Corporation".

PLAINTIFF'S EXHIBIT 3.

[Put in Evidence, page 316.]

Lease No. *4279* Turn Set. [Form 597.]

Transfer from Lease No.

This Lease and Agreement, made at Boston, Massachusetts, this *16th* day of *March* A.D. 189*8*, by and between Goodyear Shoe Machinery Company, a corporation established under the laws of the State of Maine, Lessor, and party hereto of the first part, and *Kiner Bros., Agents, doing business in Mount Holly, N. J.* Lessee, and party hereto of the second part, Witnesseth;

Whereas, the Lessor is the owner of or is licensed under the several Letters Patent of the United States, recited in the schedule following, viz.:

SCHEDULE OF PATENTS.

No. 240,307, dated April 19, 1881.	No. 461,793, dated October 20, 1891.
No. 253,156, dated January 31, 1882.	No. 463,967, dated November 24, 1891.
No. 260,990, dated July 7, 1882.	No. 488,505, dated December 20, 1892.
No. 267,798, dated November 21, 1882.	No. 495,452, dated April 11, 1893.
No. 317,758, dated May 12, 1885.	No. 518,911, dated April 24, 1894.
No. 317,759, dated May 12, 1885	No. 533,301, dated January 29, 1895.
No. 412,704, dated October 8, 1889.	No. 540,438, dated June 4, 1895.
No. 453,999, dated June 9, 1891.	No. 561,886, dated June 2, 1896.

And, whereas, the Lessee desires a license to use the inventions, or some of them, which are patented in and by the above-recited Letters Patent, and also desires a lease of the machines which are designated by their numbers in the schedule of machines following, viz.:

SCHEDULE OF MACHINES.

Goodyear Turn Machine , No. *1285*
Turn Channeler , No. *737*
Moulder , No. *620*
Turn Shoe Trimmer , No.

The said machines being the property of the Lessor:

Now, therefore, the Lessor in consideration of one dollar and

[MEMO BY CLERK.— All words and figures printed in italics in these exhibits were in handwriting in the originals.]

other valuable consideration to it paid by the Lessee, the receipt of which is hereby acknowledged, and in further consideration of the agreements and conditions hereinafter contained, on the part of the Lessee to be kept and performed, doth lease unto the Lessee the machines designated by their numbers in the foregoing Schedule of Machines, and doth license the Lessee and the operatives in his employment to use the machines hereby leased, and also such of the inventions patented as aforesaid as are embodied in the said machines, or either or any of them, but upon the agreements and conditions hereinafter set forth; and this lease and license is granted by the Lessor and accepted by the Lessee on the express condition that the Lessee shall faithfully keep and perform all the agreements and conditions herein contained on his part to be kept and performed, and upon breach of the same, or either or any of them, by the Lessee, the Lessor, notwithstanding any express or implied waiver of any prior breach, may at its option cancel and terminate this lease and license, and upon written notice thereof by the Lessor to the Lessee or to any one in the possession or apparent control of the machines hereby leased, or either or any of them, this lease and license shall terminate, and possession of the said machines shall thereupon re-vest in the Lessor;

And the Lessee hereby agrees to keep and perform all the following conditions of this lease and license:

First. The Lessee hereby agrees to use, and is hereby licensed to use, the machines hereby leased and the inventions patented as aforesaid only in his factory in *Mount Holly* in the State of *New Jersey* and only in the manufacture of boots and shoes, and agrees to keep the said machines in working order at his own expense and to procure of the Lessor or its agents all parts for repairing the machines hereby leased, and agrees not to add to or subtract from the said machines any part or mechanism whatever, now or hereafter organized or connected therewith by the Lessor, nor to make nor allow to be made any change or alteration in the same, nor to remove or deface any dates, numbers or inscriptions now or hereafter impressed thereon or affixed thereto by the Lessor.

Second. The Lessee hereby agrees to permit the agents and

inspectors of the Lessor, at all reasonable times, to have convenient access to the machines, to examine and inspect the same and the use thereof, and to verify the operator's reports, and to add improvements to the machines as the Lessor may see fit; and the agreements and conditions herein contained shall apply to all improvements which the Lessor shall hereafter add to the machines, and to all patented inventions hereafter embodied therein, with the same effect as if the patents therefor were included in the foregoing schedule of patents.

Third. The following is the schedule of rents and royalties hereinafter referred to, and which it is understood and agreed is to be paid by the Lessee for each pair of shoes or boots respectively made by the aid of the machines hereby leased, or either or any of them, or by the use of the inventions patented as aforesaid, or either or any of them, viz.:

SCHEDULE OF RENTS AND ROYALTIES FOR GOODYEAR TURNED WORK.

Children's . . .	2 cents per pair.
Misses'	2 " "
Women's . . .	3 " "
Youths'	3 " "
Boys'	3 " "
Men's	3 " "

Fourth. The Lessee hereby agrees to keep proper books of account, and make true and complete entries therein of all transactions relating to the manufacture and sale of all boots and shoes made by him, or by any other person for him or for others, by the aid of the machines hereby leased, or any of them, or by the use of the inventions patented as aforesaid, or either or any of them, and to render an account thereof to the Lessor on or before the tenth day of each month, which account shall specify the number of pairs of boots and shoes made under this lease and license during the calendar month next preceding, and the class to which they belong according to the above schedule of rents and royalties; and the Lessee agrees that he will require the operator or operators on said machines to keep a daily account of all boots or shoes made by the

aid of said machines upon the printed forms to be furnished by the Lessor, in duplicate, one copy of which, containing such reports for the calendar month next preceding, the Lessee agrees to send, on or before the tenth day of each month, to the Lessor, and, whenever required by the Lessor, to make oath to the correctness of said returns, and to allow the Lessor, by its agents or attorneys, to examine and take copies or extracts from the original book or books of account of the Lessee and the accounts kept by the operator or operators as aforesaid; and the Lessee hereby agrees to send to the Lessor, on or before the tenth day of each month, in case the machines hereby leased have not been run during the month next preceding, one of the aforesaid printed forms furnished by the Lessor, marked across the face with the words "not running," or "not in use."

Fifth. The Lessee agrees to pay unto the Lessor, as rent for the machines hereby leased, and as royalty for the use of the inventions patented as aforesaid as hereby licensed, the rent and royalty specified in the schedule forming part of Section Third herein, for each pair of boots or shoes of the respective kinds mentioned or described in said schedule, made by the aid of the said machines, or either or any of them, or by the use of the said inventions, or either or any of them; the rents and royalties for all such boots and shoes, made as aforesaid during one calendar month, to be due and payable on the last day of the calendar month next following; but the Lessor hereby agrees that, **if the rents and royalties due on the last day of any month shall be paid on or before the fifteenth day of that month, it will, in consideration thereof, grant a discount of fifty per cent. from the rents and royalties specified in the schedule aforesaid.**

Sixth. The Lessee agrees that the machines hereby leased shall be used only in the manufacture of boots or shoes known in the trade as "turns" or "turned work," and that he will not use or permit the use of said machines, or either or any of them, upon boots or shoes of any other class, or for any other purpose, unless the consent in writing of the Lessor shall first have been obtained, and that he will not use, or permit the use, in his factory, of any

sewing machine for uniting the soles of turn shoes to their uppers which is not leased to him by the Lessor, unless the consent in writing of the Lessor shall first have been obtained.

Seventh. The Lessee hereby agrees that he will not in any way violate or infringe, or contest the validity of, any of the patents under which he is hereby licensed, or the sufficiency of their specifications, or the validity of the title of the Lessor, or of its successors or assigns, to said patents, or either or any of them.

Eighth. This lease and license is not assignable by the Lessee, by his own act or by operation of law.

Ninth. The following are also agreed to by the parties to this instrument as conditions of this lease and license:

(*a*) That the power conveyed by this lease and license is only the right to use the said machines, and not the right to make or sell any machines embodying the patented inventions aforesaid, or any of them; and that a transfer or removal of the machines hereby leased, or either or any of them, can only be made with the consent of the Lessor, its successors or assigns; and that if the Lessee is or becomes at any time insolvent or bankrupt, or shall make an assignment for the benefit of his creditors, or if a sale, lease, transfer or removal of said machines, or any of them, shall be made or attempted by the Lessee, or by operation of law, or by any legal officer, representative or assignee, as the property of the Lessee, without the written consent of the Lessor, or its successors or assigns, this lease and license shall thereupon terminate and expire, and the Lessor, its successors or assigns, may take possession of said machines without the Lessee having any claim for the repayment of any part of the sum or sums which he may have paid as consideration for the delivery of this lease and license, or for rent and royalty under this instrument.

(*b*) That in case the Lessee refuses or neglects to perform, or violates any of the conditions in this lease and license contained, the Lessor, its successors or assigns, notwithstanding any express or implied waiver of any prior breach shall have the right to terminate this lease and license by giving written notice as aforesaid that it has elected so to do and upon the giving of such notice this lease

and license shall be terminated, and the possession of said machines shall thereupon re-vest in the Lessor, its successors or assigns, free and discharged of this lease and license; and the Lessor its successors or assigns, or its authorized agent or agents, may thereupon enter any premises where said machines may be, and may take and remove them, and the Lessee shall have no claim whatever on account of any sum or sums he may have paid for or under this lease or license.

(*c*) That this lease and license shall continue (provided the Lessee complies with the agreements and conditions herein contained) until the expiration of all and every the Letters Patent referred to in the foregoing the Schedule of Patents, or any extensions or renewals of the same, and upon the expiration thereof the Lessee shall deliver to the Lessor, its successors or assigns, the machines hereby leased in good order, natural wear and tear alone excepted.

Tenth. In case any other machines than those hereby leased and licensed, embracing any of the inventions patented in the aforesaid Letters Patent, or any of them, or any inventions or improvements for which Letters Patent shall be granted or assigned to the Lessor, shall hereafter come into possession of the Lessee, by exchange or otherwise, without lease or license from the Lessor, its successors or assigns, then in case the Lessor, its successors or assigns, shall so elect, all the covenants herein contained shall apply to such machines, inventions or improvements, and shall govern the parties respectively to the same extent as if the said machines, inventions or improvements had been expressly included in this lease and license. The Lessor shall give written notice of its election as aforesaid after it shall have received written notice from the Lessee of the possession of such machines, but may give such notice without having received notice from the Lessee of the possession of such machines.

Eleventh. The Lessee agrees that he will not disturb or interfere with, nor permit anyone else to disturb or interfere with, any indicator which now is or which may be hereafter placed upon the machines as aforesaid.

Twelfth. All the rights and interests which, under this instru-

ment, and by reason of the ownership of said machines and patents and patent rights, belong to the Lessor, shall be deemed to belong to and may be enforced in the names of the Lessor and its successors and assigns, and all the agreements and conditions binding on the Lessee shall be binding on his legal representatives.

Thirteenth. It is agreed that the numbers of the machines named in this lease may be entered herein by the Lessor after signing; and, in case the Lessee shall require more than one machine, it is agreed that the termination of words relating to the machines shall be construed and considered as written in the singular or plural, as the number of machines entered in the lease and license may require; and also that this instrument may be used in cases where the party of the second part shall consist of more than one person, and in that case the termination of the words relating to the said party shall be considered as plural or singular as the sense may require; and that when the party of the second part so consists of several persons, and they sign this lease, either individually or by their firm signature, such signature or signatures shall bind them both jointly and severally hereto.

In witness whereof, the Lessor has caused these presents to be signed in its name, and its corporate seal to be affixed hereto by its Treasurer, and the Lessee has set his hand and seal hereto the day and year first above written.

Executed in Duplicate.

And whereas, the Lessee desires a license to use the inventions, or some of them, which are patented in and by the above-recited Letters Patent, and also desires a lease of the machines which are designated by their numbers in the schedule of machines following, viz.:

SCHEDULE OF MACHINES.

Goodyear Welt and Turn Shoe Machine , No.
Goodyear Outsole Stitcher (Lock Stitch "Rapid"), No.
(Welt Bevelling Attachment, No.)
Goodyear Channeller (Insole), No.
Goodyear Channeller (Outsole), No.
Rounding and Channelling Machine , No.
Universal Rounding and Channelling Machine , No. *297*
Channel Lip Turner , No.
Goodyear Channel Opener , No. *248*
Goodyear Welt Beater , No.
Goodyear Shank Skiver , No.
Universal Shank Skiver , No.
Goodyear Bobbin Winder , No.
Goodyear Welt Groover , No.
Goodyear Welt Splitter , No.
Goodyear Basting Machine , No.
Universal Inseam Trimmer , No.

Goodyear Sole Layer , No.
Goodyear Automatic Sole Leveller , No.
Hadaway Stitch Separator , No. *247*

The said machines being the property of the Lessor:

Now, therefore, the Lessor, in consideration of one dollar and other valuable consideration to it paid by the Lessee, the receipt of which is hereby acknowledged, and in further consideration of the agreements and conditions hereinafter contained, on the part of the Lessee to be kept and performed, doth lease unto the Lessee the machines designated by their numbers in the foregoing Schedule of Machines, and doth license the Lessee and the operatives in his employment to use the machines hereby leased, and also such of the inventions patented as aforesaid as are embodied in the said machines, or either or any part of them, but upon the agreements and conditions hereinafter set forth; and this lease and license is granted by the Lessor and accepted by the Lessee on the express condition that the Lessee shall faithfully keep and perform all the agreements and conditions herein contained on his part to be kept and performed, and upon breach of the same, or either or any of them, by the Lessee, the Lessor, notwithstanding any express or implied waiver of any prior breach, may at its option cancel and terminate this lease and license, and upon written notice thereof by the Lessor to the Lessee or to any one in the possession or apparent control of the machines hereby leased, or either or any of them, this lease and license shall terminate, and possession of the said machines shall thereupon re-vest in the Lessor;

And the Lessee hereby agrees to keep and perform all the following conditions of this lease and license:

First. The Lessee hereby agrees to use, and is hereby licensed to use, the machines hereby leased and the inventions patented as aforesaid only in his factory in *St. Louis* in the State of *Missouri* and only in the manufacture of boots and shoes, and agrees to keep the said machines in working order at his own expense and to procure of the Lessor or its agents all parts for repairing the machines hereby leased, and agrees not to add to or subtract from the said machines any part or mechanism whatever, now or hereafter organ-

ized or connected therewith by the Lessor, nor to make nor allow to be made any change or alteration in the same, nor to remove or deface any dates, numbers or inscriptions now or hereafter impressed thereon or affixed thereto by the Lessor.

Second. The Lessee hereby agrees to permit the agents and inspectors of the Lessor, at all reasonable times, to have convenient access to the machines, to examine and inspect the same and the use thereof, and to verify the operator's reports, and to add improvements to the machines as the Lessor may see fit; and the agreements and conditions herein contained shall apply to all improvements which the Lessor shall hereafter add to the machines, and to all patented inventions hereafter embodied therein, with the same effect as if the patents therefor were included in the foregoing schedule of patents.

Third. The following is the schedule of rents and royalties hereinafter referred to, and which it is understood and agreed is to be paid by the Lessee for each pair of shoes or boots respectively made by the aid of the machines hereby leased, or either or any of them, or by the use of the inventions patented as aforesaid, or either or any of them, viz.:

SCHEDULE OF RENTS AND ROYALTIES FOR GOODYEAR WELTS.

Children's . . .	3	cents	per pair.
Misses'	4	"	"
Women's . . .	6	"	"
Youths'	4	"	"
Boys'	6	"	"
Men's	8	"	"

Fourth. The Lessee hereby agrees to keep proper books of account, and make true and complete entries therein of all transactions relating to the manufacture and sale of all boots and shoes made by him, or by any other person for him or for others, by the aid of the machines hereby leased, or any of them, or by the use of the inventions patented as aforesaid, or either or any of them, and to render an account thereof to the Lessor on or before the tenth day of each month, which account shall specify the number of pairs of boots and shoes made under this lease and license dur-

ing the calendar month next preceding, and the class to which they belong according to the above schedule of rents and royalties; and the Lessee agrees that he will require the operator or operators on said machines to keep a daily account of all boots or shoes made by the aid of said machines upon the printed forms to be furnished by the Lessor, in duplicate, one copy of which, containing such reports for the calendar month next preceding, the Lessee agrees to send, on or before the tenth day of each month, to the Lessor, and, whenever required by the Lessor, to make oath to the correctness of said returns, and to allow the Lessor, by its agents or attorneys, to examine and take copies or extracts from the original book or books of account of the Lessee and the accounts kept by the operator or operators as aforesaid; and the Lessee hereby agrees to send to the Lessor, on or before the tenth day of each month, in case the machines hereby leased have not been run during the month next preceding, one of the aforesaid printed forms furnished by the Lessor, marked across the face with the words "not running" or "not in use."

Fifth. The Lessee agrees to pay unto the Lessor as rent for the machines hereby leased, and as royalty for the use of the inventions patented as aforesaid [illegible] hereby licensed, the rent and royalty specified in the schedule forming part of Section Third herein, for each pair of boots or shoes of the respective kinds mentioned or described in said schedule, made by the aid of the said machines, or either or any of them, or by the use of the said inventions, or either or any of them; the rents and royalties for all such boots and shoes, made as aforesaid during one calendar month, to be due and payable on the last day of the calendar month next following: but the Lessor hereby agrees that, **if the rents and royalties due on the last day of any month shall be paid on or before the fifteenth day of that month, it will, in consideration thereof grant a discount of fifty per cent. from the rents and royalties specified in the schedule aforesaid.**

Sixth. The Lessee agrees that the machines hereby leased shall be used only in the manufacture of boots or shoes known in the trade as "Goodyear Welts," and that he will not use or permit the

use of said machines, or either or any of them, upon boots or shoes in the manufacture of which any sole or welt sewing machine not leased to him by the Lessor is employed, or for any other purpose than the manufacture of Goodyear Welts, unless the consent in writing of the Lessor shall first have been obtained.

Seventh. The Lessee hereby agrees that he will not in any way violate or infringe, or contest the validity of, any of the patents under which he is hereby licensed, or the sufficiency of their specifications, or the validity of the title of the Lessor, or of its successors or assigns, to said patents, or either or any of them.

Eighth. This lease and license is not assignable by the Lessee, by his own act or by operation of law.

Ninth. The following are also agreed to by the parties to this instrument as conditions of this lease and license:

(*a*) That the power conveyed by this lease and license is only the right to use the said machines, and not the right to make or sell any machines embodying the patented inventions aforesaid, or any of them; and that a transfer or removal of the machines hereby leased, or either or any of them, can only be made with the consent of the Lessor, its successors or assigns; and that if the lessee is or becomes at any time insolvent or bankrupt, or shall make an assignment for the benefit of his creditors, or if a sale, lease, transfer or removal of said machines, or any of them, shall be made or attempted by the Lessee, or by operation of law, or by any legal officer, representative or assignee, as the property of the Lessee, without the written consent of the Lessor, or its successors or assigns, this lease and license shall thereupon terminate and expire, and the Lessor, its successors or assigns, may take possession of said machines without the Lessee having any claim for the repayment of any part of the sum or sums which he may have paid as consideration for the delivery of this lease and license, or for rent and royalty under this instrument.

(*b*) That in case the Lessee refuses or neglects to perform, or violates, any of the conditions in this lease and license contained, the Lessor, its successors or assigns, notwithstanding any express or implied waiver of any prior breach, shall have the right to ter-

minate this lease and license by giving written notice as aforesaid that it has elected so to do; and upon the giving of such notice this lease and license shall be terminated, and the possession of said machines shall thereupon re-vest in the Lessor, its successors or assigns, free and discharged of this lease and license; and the Lessor, its successor or assigns, or its authorized agent or agents, may thereupon enter any premises where said machines may be, and may take and remove them, and the Lessee shall have no claim whatever on account of any sum or sums he may have paid for or under this lease or license.

(*c*) That this lease and license shall continue (provided the Lessee complies with the agreements and conditions herein contained) until the expiration of all and every the Letters Patent referred to in the foregoing Schedule of Patents, or any extensions or renewals of the same, and upon the expiration thereof the Lessee shall deliver to the Lessor, its successors or assigns, the machines hereby leased in good order, natural wear and tear alone excepted.

Tenth. In case any other machines than those hereby leased and licensed, embracing any of the inventions patented in the aforesaid Letters Patent, or any of them, or any inventions or improvements for which Letters Patent shall be granted or assigned to the Lessor, shall hereafter come into possession of the Lessee, by exchange or otherwise, without lease or license from the Lessor, its successors or assigns, then in case of the Lessor, its successors or assigns, shall so elect, all the covenants herein contained shall apply to such machines, inventions or improvements, and shall govern the parties respectively to the same extent as if the said machines, inventions or improvements had been expressly included in this lease and license. The Lessor shall give written notice of its election as aforesaid after it shall have received written notice from the Lessee of the possession of such machines, but may give such notice without having received notice from the Lessee of the possession of such machines.

Eleventh. The Lessee agrees that he will not disturb or interfere with, nor permit any one else to disturb or interfere with, any

indicator which now is or which may be hereafter placed upon the machines hereby leased.

Twelfth. All the rights and interests which, under this instrument, and by reason of the ownership of said machines and patents and patent rights, belong to the Lessor, shall be deemed to belong to and may be enforced in the names of the Lessor and its successors and assigns, and all the agreements and conditions binding on the Lessee shall be binding on his legal representatives.

Thirteenth. It is agreed that the numbers of the machines named in this lease may be entered herein by the Lessor after signing; and, in case the Lessee shall require more than one machine, it is agreed that the termination of words relating to the machines shall be construed and considered as written in the singular or plural, as the number of machines entered in the lease and license may require; and also that this instrument may be used in cases where the party of the second part shall consist of more than one person, and in that case the termination of the words relating to the said party shall be considered as plural or singular as the sense may require; and that when the party of the second part so consists of several persons, and they sign this lease, either individually or by their firm signature, such signature or signatures shall bind them both jointly and severally hereto.

In witness whereof, the Lessor has caused these presents to be signed in its name, and its corporate seal to be affixed hereto by its Treasurer, and the Lessee has set his hand and seal hereto the day and year first above written.

Nicking Machines,	No.	No. ,	No. ,	No. ,	No.

The said machines being the property of the Lessor.

Now, therefore, the Lessor, in consideration of one dollar and other valuable consideration to it paid by the Lessee, the receipt of which is hereby acknowledged, and in further consideration of the agreements and conditions hereinafter contained, on the part of the Lessee to be kept and performed, doth lease unto the Lessee the machines designated by their numbers in the foregoing schedule of machines, and doth license the Lessee and the operatives in his employment to use the machines hereby leased, and also such of the inventions patented as aforesaid as are embodied in the said machines, or either or any of them, but upon the agreements and conditions hereinafter set forth; and this lease and license is granted by the Lessor and accepted by the Lessee on the express condition that the Lessee shall faithfully keep and perform all the agreements and conditions herein contained on his part to be kept and performed, and upon breach of the same, or either or any of them, by the Lessee, the Lessor, notwithstanding any express or implied waiver of any prior breach, may at its option cancel and terminate this lease and license, and upon written notice thereof

by the Lessor to the Lessee or to any one in the possession or apparent control of the machines hereby leased, or either or any of them, this lease and license shall terminate, and possession of the said machines shall thereupon re-vest in the Lessor;

And the Lessee hereby agrees to keep and perform all the following conditions of this lease and license: —

First. The Lessee hereby agrees to use, and is hereby licensed to use, the machines hereby leased and the inventions patented as aforesaid only in his factory in *San Francisco*, in the State of *California* and agrees to keep the said machines in working order at his own expense, and to purchase of the Lessor or its agents all parts for repairing the machines hereby leased, and all tacks to be used in the loose tackers and hoppers hereby leased, and agrees not to add to or subtract from the said machines any part or mechanism whatever, now or hereafter organized or connected therewith by the Lessor, nor to make nor allow to be made any change or alteration in the same, except by an authorized agent or employee of the Lessor, nor to remove or deface any dates, numbers, or inscriptions now or hereafter impressed thereon or affixed thereto by the Lessor.

Second. The Lessee hereby agrees to permit the agents and inspectors of the Lessor, at all reasonable times, to have convenient access to the machines, to examine and inspect the same and the use thereof, and to add improvements or to alter the machines as the Lessor may see fit; and the agreements and conditions herein contained shall apply to all improvements which the Lessor shall hereafter add to the machines, and to all patented inventions hereafter embodied therein, with the same effect as if the patents therefor were included in the foregoing schedule of patents.

Third. The Lessee agrees to keep proper books of account and to make true and complete entries therein, showing the number of pairs of boots or shoes which are lasted, in whole or in part, upon or by the aid of the machines hereby leased, or either or any of them, or by the use of the inventions patented as aforesaid, or either or any of them, and to render an account thereof to the Lessor on or before the tenth day of each month, which account

shall specify the number of pairs of boots and shoes so lasted, in whole or in part, as aforesaid; and the Lessee agrees to require each operator on said lasting machines to keep in duplicate in books or on printed forms to be furnished by the Lessor, a daily record of all the boots or shoes lasted, in whole or in part, upon or by the aid of the said machines, one copy of which, containing the record for the calendar month next preceding, the Lessee agrees to send, on or before the tenth day of each month, to the Lessor, and, whenever requested by the Lessor, to make oath to the correctness of said record, and to allow the Lessor, by its agents and attorneys, to examine and take copies or extracts from the original book or books of account of the Lessee and the record kept by the operator or operators as aforesaid; and the Lessee hereby agrees to send to the Lessor, on or before the tenth day of each month, on a form to be furnished by the Lessor, the number of movements or revolutions of the shaft of each lasting machine hereby leased, as registered by the indicator thereon on the last day of the calendar month next preceding; and the Lessee hereby agrees to send to the Lessor, on or before the tenth day of each month, in case the machines hereby leased have not been run during the month preceding, one of the aforesaid books or forms furnished by the Lessor, marked across the face with the words, "not running", or "not in use".

Fourth. The Lessee agrees that he will not use or permit the use of the machines hereby leased, or either or any of them, on boots or shoes which are to be partially or wholly completed by the aid of any sole- or welt-sewing machine not leased to him by the Lessor (except that they may be used in lasting boots and shoes known in the trade as "McKay Sewed"), and that he will not use or permit the use of any of the tackers hereby leased on boots or shoes which have been partially or wholly lasted by the aid of any lasting machine not leased to him by the Lessor.

Fifth. The Lessee agrees to pay unto the Lessor, as rent for the machines hereby leased and as royalty for the use of the inventions patented as aforesaid as hereby licensed, the sum of one cent for each and every pair of boots or shoes lasted, in whole or in part,

upon or by the aid of the machines hereby leased, or either or any of them, or by the use of the said inventions, or either or any of them, the rents and royalties for all such boots and shoes lasted as aforesaid during one calendar month to be due and payable on the last day of the calendar month next following; but the Lessor hereby agrees that if the rents and royalties due on the last day of any month shall be paid on or before the fifteenth day of that month, it will, in consideration thereof, grant a discount of fifty per cent. from the rents and royalties above specified.

Sixth. The Lessee agrees that he will not in any way violate or infringe, or contest the validity of, any of the patents under which he is hereby licensed, or the sufficiency of their specifications, or the validity of the title of the Lessor, to said patents, or any of them.

Seventh. The following are also agreed to by the parties as conditions of this lease and license: —

(*a*) That the power conveyed by this lease and license is only the right to use the said machines, and not the right to make or sell any machine embodying the inventions patented as aforesaid, or any of them; and that a transfer or removal of the machines hereby leased, or either or any of them, can only be made with the consent of the Lessor; and that if the Lessee is or becomes at any time insolvent or bankrupt, or shall make an assignment for the benefit of his creditors, or if a sale, lease, transfer, or removal of said machines, or any of them, shall be made or attempted by the Lessee, or by operation of law, or by any legal officer, representative, or assignee, as the property of the Lessee, without the written consent of the Lessor, this lease and license shall thereupon terminate and expire; and the Lessor may take possession of said machines without the Lessee having any claim for the repayment of any part of the sum or sums which he may have paid as consideration for the delivery of this lease and license, or for rent and royalty under this instrument.

(*b*) That in case the Lessee refuses or neglects to perform, or violates, any of the conditions in this lease and license contained, the Lessor, notwithstanding any express or implied waiver of any

prior breach, shall have the right to terminate this lease and license by giving written notice as aforesaid that it has elected so to do; and upon the giving of such notice this lease and license shall be terminated, and the possession of said machines shall thereupon revest in the Lessor free and discharged of this lease and license; and the Lessor, or its authorized agent or agents, may thereupon enter any premises where said machines may be, and may take and remove them, and the Lessee shall have no claim whatever on account of any sum or sums he may have paid for or under this lease and license.

(*c*) That this lease and license shall continue (provided the Lessee complies with the agreements and conditions herein contained) until the expiration of all and every the Letters Patent referred to in the foregoing Schedule of Patents, or any extensions or renewals of the same; and upon the expiration thereof the Lessee shall deliver to the Lessor, its successors or assigns, the machines hereby leased in good order, natural wear and tear alone excepted.

Eighth. The Lessee hereby agrees that if the indicator attached to any lasting machine hereby leased shall cease to register or indicate correctly the number of movements or revolutions of the shaft to which it is connected, or if the glass covering of the face of the indicator shall be broken, he will not use the said lasting machine, or allow it to be used, until the indicator thereon shall have been repaired or replaced by the Lessor; and agrees that if the glass covering of the indicator shall become broken, or if, for any reason, the indicator shall cease to indicate or register correctly, he will forthwith notify the Lessor in writing thereof; and the Lessee agrees that he will not, nor will he allow any one, except an authorized agent or employee of the Lessor, to remove the indicator from the said lasting machine, or injure, alter, or in any way tamper therewith, or permit any such alteration, injury, or tampering to take place.

Ninth. This lease and license is not assignable by the Lessee by his own act or by operation of law; and all the rights and interests which under this instrument, and by reason of the ownership of said machines and patents and patent rights belong to the Lessor, shall be deemed to belong to and may be enforced in the names of

the successors and assigns of the Lessor, and all the agreements and conditions binding on the Lessee shall be binding on his executors or administrators.

Tenth. It is agreed that the numbers of the machines named in this lease may be entered herein by the Lessor after signing; and, in case the Lessee shall require more than one machine, it is agreed that the termination of words relating to the machines shall be construed and considered as written in the singular or plural as the number of machines entered in the lease and license may require; and also that this instrument may be used in cases where the party of the second part shall consist of more than one person, and in that case the termination of the words relating to the said party shall be considered as plural or singular as the sense may require; and that when the party of the second part so consists of several persons, and they sign this lease, either individually or by their firm signature, such signature or signatures shall bind them both jointly and severally to the terms and agreements herein contained.

In witness whereof, the Lessor has caused these presents to be signed and its corporate seal to be affixed hereto by its Treasurer, and the Lessee has set his hand and seal hereto the day and year first above written.

[Form 995.] Lasting Machine Set (Royalty). 24th.

APPLICATION FOR LEASE OF MACHINES.

Jan 28 1899

To Goodyear Shoe Machinery Company, 104 Bedford Street, Boston, Mass.

Being desirous of using your machines, mentioned in the schedule below, in the manufacture of boots and shoes, the undersigned hereby requests a lease of the said machines and a license to use the patented inventions embodied therein, and consents to accept a

lease and license of the tenor of the Lease and License "Form 995," adopted by your Company.

Upon receipt of such lease and license from you, the undersigned agrees to sign the lease and license in duplicate, to return one original to you, and to pay, upon delivery of the said machines, the sum of $300.00 as consideration for the delivery of such lease and license, for the expenses of setting up said machines, and for the possession of the said machines under the lease and license.

Schedule of Machines Referred to Above.

One Ideal Lasting Machines *295*.
Rapid Lasting Machines (foot power).
Rapid Power Lasting Machines.
Two Rapid Loose Tackers, with Hoppers, *425*, *426*.

Mar 13 1899 *Paid $300.*
Mens Work 1311 & 1312 B Plates.

It is understood that the undersigned is to send you patterns of the largest and widest innersoles of each style of boots or shoes to be lasted on the machines, in order to fit the toe wipers properly, and that you will furnish ten pairs of wipers gratis with each lasting machine. Additional wipers are to be paid for by the undersigned.

The undersigned agrees to pay the freight end transportation charges on said machines from Boston, Mass.

How shall the machines be shipped, by freight or express? *Md. Dis. Chigo. N. W. & U. P.*

Dated *Jan 23*, 1899

Applicant will sign here. ROSENTHAL FEDER & Co.

In compliance with the foregoing application, the Goodyear Shoe Machinery Company agrees to grant you such lease and license of said machines, and will deliver the machines F. O. B. in Boston, and at its own expense will send a competent man to set up and put said machines in operation.

GOODYEAR SHOE MACHINERY COMPANY,
By Fredk. G. King, General Manager.

Dated *Jan. 30th*, 1899

Transfer from *Cloutman, Dunham & Co.* License No. *204*

This license and rental lease agreement, made in duplicate the *31st* day of *January* A. D. 18 *1900*, by and between the

United Shoe Machinery Co.

~~Consolidated & McKay Lasting Machine Company~~,

(McKay & Copeland Department),

a corporation incorporated under the laws of the State of Maine, Licensor and party of the first part, and *the Milford Shoe Co.* of *Milford, Mass.*, Licensee and party of the second part, Witnesseth:

Whereas, the Licensor is now the owner of the following Letters Patent of the United States relating to Lasting Machines or auxiliary machines for lasting, to wit: No. 247,143, dated September 13, 1881; No. 248,398, dated October 18, 1881; No. 248,448, dated October 18, 1881; No. 250,450, dated December 6, 1881; No. 251,205, dated December 20, 1881; No. 251,430, dated December 27, 1881; No. 254,617, dated March 7, 1882; No. 284,174, dated September 4, 1883; No. 286,898, dated October 16, 1883; No. 288,689, dated November 20, 1883; No. 302,885, dated August 5, 1884; No. 306,671, dated October 14, 1884; No. 309,519, dated December 23, 1884; No. 312,550, dated February 17, 1885; No. 312,962, dated February 24, 1885; No. 352,851, dated November 16, 1886; No. 371,816, dated October 18, 1887; No. 444,792, dated January 13, 1891; No. 458,000, dated August 18, 1891; No. 458,001, dated August 18, 1891; No. 473,873, dated April 26, 1892; No. 507,551, dated October 31, 1893; No. 516,074, dated March 6, 1894; No. 524,445, dated August 14, 1894; No. 524,446, dated August 14, 1894; No. 524,447, dated August 14, 1894; No. 536,780, dated April 2, 1895; No. 537,269, dated April 9, 1895; No. 537,270, dated April 9, 1895; No. 539,065, dated May 14, 1895; No. 548,671, dated October 29, 1895; No. 548,862, dated October 29, 1895; No. 601,933, dated April 5,

1898; No. 601,934, dated April 5, 1898; No. 601,935, dated April 5, 1898; No. 601,936, dated April 5, 1898; No. 601,937, dated April 5, 1898; No. 601,938, dated April 5, 1898; No. 601,939, dated April 5, 1898; No. 601,940, dated April 5, 1898; No. 601,941, dated April 5, 1898; No. 601,942, dated April 5, 1898; and other patents applied for and now pending, and is, moreover, the owner of or licensee under other patents not herein enumerated.

And, whereas, the Licensee desires the right to use, under the terms of this License and Lease Agreement, the hereinafter described machines and accessories belonging to and owned by the Licensor, and also any improvements relating to the machines and accessories hereby licensed and leased for rental, which may hereafter be acquired by the Licensor, and attached to any of the machines and accessories hereby licensed and leased for rental, or delivered to the Licensee, to be used in connection therewith; and, also, any other machines, machinery, or device made by or for the Licensor, which may hereafter come into the possession of the Licensee:—

Now, therefore, the Licensor, in consideration of one dollar to it paid by the Licensee, the receipt whereof is hereby acknowledged, and the further consideration of dollars to be hereafter paid for this license, and of the agreements and conditions herein agreed upon, to be kept and performed by the Licensee, does hereby license and lease for rental, unto the Licensee, the machines and accessories herein designated by their respective numbers, said machines or accessories embodying the inventions of some of the foregoing named patents, viz.:—

Lasting Machines (Copeland) Nos. ~~344~~, ~~385~~, ~~386~~, ~~388~~.
Hand Tackers (Brock) Nos. ~~591~~, ~~594~~, ~~598~~, ~~600~~.
Pinking Machines (Copeland) Nos. ~~245~~, ~~256~~, ~~368~~, ~~369~~

property of the Licensor, into the possession of the Licensee for lasting shoes and boots at the factory of the Licensee, and nowhere else. Said machines or accessories are constructed in accordance with and embody the invention or inventions, or some part thereof, described in said letters patent granted, and other letters patent

hereafter to be granted, and to which other letters patents when granted this license and lease agreement shall apply, and the parties hereunto shall be bound relatively thereto, the same in all respects, as if all said patents had been granted and the numbers and dates thereof specially enumerated in this license and lease for rental before signing.

And the Licensor does hereby license the Licensee, and the operatives in his employ, to use said machines and accessories, but only upon the terms and conditions herein set forth, and the Licensor does hereby also license the Licensee to use the inventions of all or any of said patents above enumerated or referred to, and all re-issues, renewals, and extensions of the same, embodied in said machines or accessories, or hereafter attached to or incorporated therein; Provided, however, and this license and lease is granted upon the expressed condition, that the Licensee shall faithfully keep and perform all the agreements and conditions herein contained, on his part to be kept and performed, and upon breach of the same or either of them by the Licensee, the Licensor may, at its option, cancel and terminate this license and lease for rental by giving written notice to the Licensee, or to anyone in the possession or apparent control of the machines, that it has elected so to do, and upon giving such notice, this license and lease for rental shall terminate, and upon the Licensor demanding or taking possession of said machines as herein provided, or demanding, taking, or accepting possession of a part of said machines or accessories without cancellation of this agreement, or otherwise, then the possession of said machines and accessories demanded, taken or accepted shall thereupon revest in the Licensor.

And the following terms and conditions of this license and lease for rental of the machines, together with those hereinbefore expressed, the Licensee hereby agrees to keep and perform, and upon condition of such faithful performance, this license and lease for rental is granted:

Article 1. The Licensee is by this license and lease for rental authorized to use the machines and accessories, herein described, only by himself or operators in his direct employ, and only in

Milford State of *Mass.* He shall not add to or subtract from the machines or accessories, any part or mechanism whatever now or hereafter organized or connected therewith by the Licensor, its agents, its direction or with its consent; nor make or allow to be made any change or alteration in the same, without the written consent of the Licensor, nor interfere with the proper operation of the machines and accessories, or any mechanism forming a part thereof, or attached thereto, or which may hereafter be attached thereto, or any device used in connection therewith, nor remove or deface any dates, numbers or inscriptions now or hereafter impressed thereon, or affixed thereto, by the Licensor, or by its direction. And the Licensee shall at all times, at his own expense, keep and maintain the machines and accessories in as good and efficient working order as the same now are or may hereafter be put by the Licensor.

Article 2. The Licensor and its agents shall, at all reasonable times, have access to the machines and accessories to examine and inspect the same and the use thereof, and to repair, improve or add to the same so far as it sees fit; and all covenants, stipulations and conditions herein contained shall apply to all improvements which the Licensor or its agents shall hereafter add to the machines or accessories, and to any patents which have or may be issued therefor with the same effect as if all such patents had been enumated in this license and lease for rental with the letters patent previously herein enumerated.

Article 3. The Licensee agrees to pay unto the Licensor on or before the fifteenth day of each month, as rental for the previous month, for the machines and accessories hereby licensed and leased for rental, and for the use of the inventions of the patents under which a license is hereby granted, a sum of lawful money equal to two cents for each and every pair of shoes and boots lasted, in whole or in part, by the aid of said machines or accessories, or any of them, or by the use of any of the inventions of said patents, or any of them, or in the making of which any of the inventions of said patents shall be used, and said rental of two cents for each and every pair of shoes and boots is hereby agreed upon by and between the parties hereto as the just, fair and correct value to the Licensee

for the rental and use of the machines and accessories, or any of them, and of the patents and inventions hereby licensed to the Licensee by the Licensor, if any are so used, and that the abated rental hereinafter named is not the true value of the license hereby granted, but is a concession and abatement of such value for and in consideration of the conditions hereunto attached, and this agreement and responsibility, and all others in this license and rental lease, shall extend to and in respect of all shoes and boots made or lasted, in whole or in part, by the aid of said machines and accessories, or any of them, embracing any inventions of any of the patents which the Licensee is hereby licensed to use, whether made by the Licensee, or by other persons for him, or obtained by the Licensee from any source whatever; provided, however, that in all cases when the Licensee shall pay to the Licensor in lawful money, on or before the fifteenth day of each month, the abated rental of one half of one cent per pair for each and every pair of shoes lasted in whole or in part by the use of said machines, or any of them, or in which any of the inventions or any of the patents shall have been used, except upon "Goodyear" or "welt shoes," upon which the abated rental shall be one cent per pair, and the abated rental of three quarters of one cent per pair for each and every pair of boots (having long legs) lasted as aforesaid, then said payments so duly made, together with any other indebtedness then due to the Licensor, shall be full payment and satisfaction of the rental for the use of said machines and accessories, or any of them, and of the license for the use of said patents, so far as may have been used for such shoes and boots, in respect to which said payment shall have been so duly made, and it is further agreed that on default of payment of such abated rental, together with any other indebtedness due to the Licensor, on or before the fifteenth day of each and every month, the Licensee shall forfeit the right to any abatement of the full rental of two cents per pair as herein provided, and it is agreed between the parties hereto that the abated rental shall be the same for the same kind of work to all Licensees in the United States for like machines and accessories acquired from the Licensor. And it is hereby further agreed that for each and every pair of

shoes and boots made or lasted, in whole or in part, by the aid of said machines or accessories, or any of them, hereby licensed or made by or for the Licensee by the use of any of the inventions of the patents hereby licensed, and in respect to which there shall not have been paid the abated rental as hereinbefore set forth, the Licensee agrees to pay in lawful money, to the Licensor, the sum of two cents as liquidated, fixed and settled damages. And it is also specially agreed that the monthly rental reports may be computed at abated rental, and in addition to the foregoing agreements relative to rental and to the abated rental, and to payments as liquidated damages of the full rental value, in case of neglect or default of, or refusal to make payment when due (it is agreed by the Licensee that in case he becomes insolvent, or makes an assignment for the benefit of creditors, or in case his property or business goes into the hands of a receiver), that then all rental due to the Licensor shall be at once computed at the full rental value, as previously provided herein, and the Licensee expressly obligates himself and assigns to promptly pay the same and not to contest or dispute any claim for the said full rental of two cents per pair for all shoes and boots lasted as herein provided.

Article 4. The Licensee agrees that the operators on the machines hereby licensed and leased shall keep a daily account (on blanks furnished by the Licensor for this purpose) of the number of pairs of shoes and boots lasted by them, and the class to which they belong, or which were lasted, in whole or in part, by the aid of any of said machines or accessories, or in the making of which any of the inventions of said patents were employed, which account shall be signed by the operator (and verified and signed by the Licensee if so requested by the Licensor) and delivered by the Licensee to the Licensor at Boston, Mass., not later than the fifth of each month during the continuance of this license and lease for rental for the month then next preceding, and rental shall be paid by the Licensee on the basis of said account, unless the Licensor requests payment to be made by count as indicated by the indicators attached to each and every lasting machine, and the Licensee agrees to give the Licensor, its successors or assigns, or its or their

authorized agents, free access at all times to the premises where the machines and accessories hereby licensed and leased are located, for the purpose of verifying the operators' reports, or the reports of the reading of said indicators, and in case operators' or indicators' reports shall not be duly made as provided, then it shall be the right of the Licensor to appoint a competent man to keep the accounts herein required, and all reasonable compensation for the services of such man (which shall not exceed $3.00 per day), and his necessary expenses shall be at the charge of the Licensee, and the Licensee hereby agrees to pay the same upon demand of the Licensor.

The Licensee agrees that he will allow the Licensor, its successors or assigns, and its and their agents at any time hereafter, to attach an indicator, or any other mechanism, to any machine embracing any of the inventions of the patents hereby licensed, which now is or may hereafter come into the possession of the Licensee for the purpose of recording the number of revolutions of the driving-shaft of said machines, or otherwise indicating the number of shoes and boots lasted upon by said machine, or the quantity of work done by said machines, and to examine, modify, repair, or replace such indicator, and the Licensee will not disturb or interfere with, nor permit anyone to disturb or interfere with, any indicator which now is or may hereafter be placed upon any machine as aforesaid, and in case any indicator shall become inoperative, the Licensee agrees to give immediate notice to the Licensor, and to keep and render as herein provided a correct account of the shoes and boots lasted, in whole or in part, on, or by the aid of, any of the machines and accessories while said indicators are out of order.

Article 5. The Licensee hereby agrees that he will not in any way violate, or infringe, or contest, the validity of any of the patents, or any re-issue or extension of same, under which he is hereby licensed, or the sufficiency of their specifications, or the validity of the title of the Licensor to said patents, or any of them, and hereby specially admits the validity and sufficiency thereof as an important part of the consideration of this license and lease for rental.

Article 6. The Licensee hereby agrees that the machines and accessories shall not be transferred, and that this license and lease agreement for rental is not assignable by the Licensee by his own act or by operation of law.

Article 7. The Licensee hereby agrees that the power conveyed by this license and lease is only the right to use the specified machines and accessories and not the right to make, sell, or alter any machine embodying the inventions of the patents aforesaid, or any of them, and a transfer or removal of machines hereby licensed and leased shall only be made with the written consent of the Licensor, and if the Licensee is, or becomes at any time, insolvent or bankrupt, or a sale, loan, transfer or removal of said machines shall be made or attempted by the Licensee, or anyone acting in his interests, or by operation of law, or by any legal officer, representative or assignee, as the property of the Licensee, or otherwise, without the written consent of the Licensor, then this license and lease agreement for rental shall, at the option of said Licensor, terminate and expire, and said Licensor may then take possession of said machines, and accessories, without the Licensee or his representatives having any claim for repayment of any sum, or sums, which he may have paid as consideration for the delivery of this license for rental, or for any other purpose under this instrument.

Article 8. The licensee further agrees that if for any cause any of the machines hereby licensed and leased for rental shall remain unused for a period of four consecutive months, to the extent that each of said machines does not earn for the said Licensor, at the above mentioned rates, an amount equal to, or in excess of, twenty dollars for each of said four consecutive months, then said Licensor may by paying to the Licensee a sum of money equal to one third of the amount paid by him for this license, pro rata, as the sum paid for this license bears to the number of lasting machines hereby licensed, cancel and terminate this license and lease for rental, so far as it relates to said unused machines, by giving written notice that it has elected so to do, and upon giving such notice, this license and lease for rental shall be terminated, to the

extent aforesaid and the title and possession of said unused machines and accessories shall thereupon revest in said Licensor, or the Licensor may at its option, at any time thereafter, while the said unused machines remain unused, cancel this license and lease for rental, so far as it relates to said unused machines, by giving written notice (as herein provided) that it has elected so to do, and upon giving such notice, this license and lease for rental shall terminate to the extent aforesaid, and the title and possession of said unused machines and accessories shall thereupon revest in said Licensor, but, in case of this latter form of cancellation and reclamation, the Licensor shall pay the Licensee the proporation of the original price paid by the Licensee for this license and lease in proporation to the number of lasting machines originally delivered under said license and lease, and for which said sum of money was then paid, after deducting therefrom the cost of putting the machines and accessories in good repair, including all improvements, and also deducting for deterioration of machines by use or otherwise, and other expense in reference thereto, as provided and enumerated in Article 12, and these options and rights of cancellation and reclamation shall be independent of any other options or conditions contained in this license and lease agreement.

Article 9. This license and lease for rental shall continue until canceled by the Licensor for breach of condition or otherwise, but in case the Licensee refuses, or neglets to perform, or violates any condition of this license and lease, the Licensor shall have the right to terminate this license and lease by giving written notice aforesaid that it has elected so to do, and upon giving of such notice for any cause whatsoever, as herein provided for, this license and lease shall then terminate, and the possession of said machines and accessories shall thereupon revest in the Licensor, free and discharged of this license and lease. Upon the termination of this license and lease, by lapse of time, cancellation, breach of condition, non-use of machines, or otherwise, the Licensee shall forthwith deliver the machines and accessories hereby licensed and leased to the Licensor in good condition, reasonable wear and tear excepted, all risk and expense of transportation to and from

Licensee's factory being assumed and paid by the Licensee, and upon such termination, and without prejudice to any other legal rights or remedies for violation of contract, use of machines or accessories, without right, or infringement of patents, the Licensor or its agents may thereupon enter the premises where said machines and accessories may be and may take and remove the same, and the Licensee shall have no claim whatsoever against the Licensor under this license and lease.

Article 10. The Licensee hereby further agrees to keep all said machines and accessories insured for the benefit of the ~~Consolidated & McKay Lasting Machine~~ United Shoe Machinery Company (McKay and Copeland Department) for a sum not less than three hundred dollars for each and every lasting machine and its accessories, and to pay all taxes assessed on said machines and accessories. In case any of these machines or accessories are destroyed by fire, the Licensee agrees to pay to the Licensor the sum of three hundred dollars for each lasting machine and its accessories as partial compensation to the Licensor for its equity in this license and lease for rental, for such destruction of said machine and accessories.

Article 11. In case any other machines than those hereby licensed and leased, embracing any of the inventions of any of the patents under which this license is hereby granted, shall hereafter be ordered by, or come into the possession of the Licensee, without any other license and lease from the Licensor, then, in case the Licensor shall so elect, all the covenants herein contained shall apply to such machines and accessories, and shall govern the parties respectively to the same extent as if the said machines and accessories had been expressly included in this license and lease. The Licensor shall give written notice of its election, as aforesaid, within thirty (30) days after it shall have received written notice from the Licensee of the possession of such machines and accessories, but it may give such notice without having received such notice from the Licensee.

Article 12. It is declared and understood that it is the intention of the Licensee to use said machines and accessories herein licensed

and leased for lasting all of the shoes and boots made by him applicable to said machines, and not to have them in his possession as a means of reducing the price of hand-lasting, nor to control hand-lasters, or to influence any trade in connection with any other lasting machines not controlled by the Licensor, or the price-list for lasting thereon; and the Licensor enters into this contract because of and by reason of such understanding and upon such agreement on the part of the Licensee. It is therefore agreed that the Licensee shall use said machines and accessories hereby licensed and leased for rental, lasting all of his shoes and boots to their full capacity, limited only to the demands of his business; and should the demands of his business require, he shall take the license and lease of such additional machines and accessories as may be required to last all of his work, and in default of such use, the Licensor may at its option remove said machines and accessories, or any of them, from the possession of the Licensee, and may cancel this license and lease; and, in that case, the Licensor shall pay the Licensee, pro rata, the sum paid it for this license and lease for the return and possession of said machines and accessories, after deducting therefrom, viz.: —

1st. Fifteen per cent for deterioration.

2d. Whatever expense the Licensor may have been at in setting up, adjusting said machines, instructing operators, and getting said machines and accessories into use in the factory of the Licensee.

3d. The cost of rebuilding and improving said machines, or putting them in suitable order, for again being licensed to, and operated by, other Licensees.

Article 13. It is agreed that the Licensee shall buy of the Licensor, or its authorized agents, and only of it or them, all spare parts for repairing the machines hereby licensed and leased for rental, and also all the string-nail, tack-strips, or other fastenings, driven by any appliance for lasting all shoes or boots lasted in whole or in part by the aid of any of the machines or accessories hereby licensed and leased, or in the making of which any of the inventions of said patents shall be used, and that the same shall be sold by the Licensor at the same price to all Licensees for the time

being. The prices for the same to be fixed by the Licensor. And the Licensee shall and does hereby accept, at the option of the Licensor, delivery of machine or machines, f. o. b. cars, either at Lawrence, Mass., or at Beverly, Mass.

Article 14. All the rights and interests, which, under this instrument, and by reason of the ownership of said machines, accessories, patents, and patent rights, belong to the Licensor, shall be deemed to belong to, and may be enforced in its name, or otherwise, by the Licensor, its successors and assigns, and its or their representatives and assigns. All of the stipulations and agreements binding on the Licensee shall be binding on his or their representatives, successors and assigns.

Article 15. It is agreed that this instrument may be used for Licensees of the female sex, or for corporations, and in that case the masculine pronoun denoting the Licensee shall, whenever it occurs, be instead of and indicate the feminine, or neuter, as the case may be; and, also, that when the party of the second part shall consist of more than one person, the termination of the words relating to the said party shall be considered as singular or plural, as the sense may require; and that when the party of the second part so consists of several persons, and they sign this license and lease for rental, either individually or by their firm signature, such signature or signatures shall bind them, both jointly and severally, to the terms and agreements herein contained; and, also that the numbers of the machines delivered under, or named in, or covered by this license and lease, may be entered herein by the Licensor after signing; and, that as this instrument is designed and intended for continuous use between the parties hereto, in case the Licensee shall have more than one machine (or set of machines) it is agreed that the termination of words relating to the machine shall be considered as written in the singular or plural, as the number of machines (or set of machines) entered in this license and lease for rental may require.

In Witness Whereof, the parties aforesaid have hereunto set their hands and seals, the said parties of the second part binding them-

selves, their legal representatives, and assigns, to all the foregoing agreements, both jointly and severally.

200-6-8-1898-CCC.

License and Rental Lease No.

Transfer from License No.

This License and Rental Lease Agreement, made in duplicate the *19th* day of *September*, A. D. 18*98*, by and between the

Consolidated & McKay Lasting Machine Company,

(Chase Department)

a corporation incorporated under the laws of the State of Maine, Licensor and party of the first part, and *Thayer, Maguire & Field* of *Haverhill, Mass.*, Licensee and party of the second part, Witnesseth:

Whereas, the Licensor is now the owner of the following Letters Patent of the United States relating to Lasting Machines or auxiliary machines for lasting, to wit: No. 319,784, dated June 9, 1885; No. 337,662, dated March 9, 1886; No. 337,924, dated March 16, 1886; No. 337,925, dated March 16, 1886; No. 338,930, dated March 30, 1886; No. 340,860, dated April 27, 1886; No. 356,619, dated January 25, 1887; No. 356,620, dated January 25, 1887; No. 363,283, dated May 17, 1887; No. 364,088, dated May 31,

1887; No. 376,368, dated January 10, 1888; No. 391,688, dated October 23, 1888; No. 477,788, dated June 28, 1892; No. 477,789, dated June 28, 1892; No. 478,501, dated July 5, 1892; No. 483,375, dated September 27, 1892; No. 545,052, dated August 27, 1895; No. 558,011, dated April 7, 1896; No. 561,189, dated June 2, 1896; No. 571,404, dated November 17, 1896; No. 569,590, dated October 13, 1896; No. 569,182, dated October 13, 1896; No. 569,231, dated October 13, 1896; No. 571,339, dated November 17, 1896; No. 571,429, dated November 17, 1896; No. 571,509, dated November 17, 1895; and other patents applied for and now pending, and is, moreover, the owner of other patents not herein enumerated;

And, whereas, the Licensee desires to use the hereinafter described machines belonging to the Licensor:—

Now, therefore, the Licensor, in consideration of one dollar to it paid by the Licensee, the receipt whereof is hereby acknowledged, and of the stipulations and conditions hereinafter contained on the part of the Licensee to be kept and performed, doth loan unto the Licensee the machines designated by their numbers in the following schedule, the said machines embodying some of the foregoing named patents:—

1 Lasting Machine (Chase) No. *596.*

2 Hand Tackers (Chase Stop Motion) Nos. *2130, 2135.*

And the Licensor does hereby license the Licensee, and operatives in his employment, to use said specified loan or rented machines upon the terms and conditions herein set forth; provided, however, and this loan is made and this license is granted on the expressed condition that the Licensee shall faithfully keep and perform all the conditions and stipulations herein contained on his part to be kept and performed, and upon breach of the same or either of them by the Licensee, the Licensor may, at its option, cancel and terminate this loan and license, and upon written notice thereof by the Licensor to the Licensee, or to anyone in the possession or apparent control of the machines, this loan and license shall terminate, and possession of said machines shall thereupon revest in the Licensor. It is also agreed that the Licensor may, at

its option, upon breach of any condition herein contained, take possession of said machines, or any of them, without termination of this agreement.

And the following are also agreed to as terms and conditions of the loan and license of the machines which the Licensee is hereby licensed to use, all of which, together with those hereinbefore expressed, the Licensee hereby agrees to keep and perform: —

First.—The Licensee is by this loan and license authorized to use the machines hereby loaned, only by himself or operatives in his direct employ, and only in *Haverhill, Mass.*

He shall not add to nor subtract from the machines any mechanism whatever now or hereafter organized or connected therewith by the Licensor, nor make nor allow to be made any change or alteration in the same, without the consent thereto in writing of the Licensor, nor interfere with the proper operation of the machines, nor any mechanism forming a part thereof, or attached thereto, nor remove nor deface any dates, numbers or inscriptions, now or hereafter impressed thereon or affixed thereto by the Licensor, and shall at all times at his own expense, keep and maintain the machines in as good and efficient working order as the same now are or may hereafter be put by the Licensor. All risks and expense of transportation to and from the Licensee's factory shall be assumed by the Licensee. Inasmuch as the machines are only loaned by the Licensor, and the Licensee pays no purchase price for the machines, the said machines do and shall continue to belong exclusively to and remain wholly the property of, and subject to the control of the Licensor, and the Licensee acquires no right to buy or to retain said machines except by the written consent of the Licensor. The Licensee agrees to keep the Lasting Machines and accessories in first-class order and repair at his own expense. The Licensee also hereby covenants and agrees to keep the Lasting Machines and accessories insured by a policy satisfactory to the Chase Department of the Consolidated & McKay Lasting Machine Company for two hundred dollars each, and to pay all taxes assessed on said machines. In case any Lasting Machines are damaged by fire, directly or indirectly, the Licensee

agrees to pay to the Licensor the sum of two hundred dollars for each Lasting Machine, including its accessories, so damaged.

Second.—The Licensor and its agents may, at all reasonable times, have convenient access to the machines to examine and inspect the same and the use thereof, and to repair and improve the same so far as it sees fit; and the covenants, stipulations and conditions herein contained shall apply to all improvements which the Licensor shall hereafter add to the machines and to all patents on said improvements, the right to use which shall be owned by the Licensor, with the same effect as if said patents were included in the list of patents hereinbefore set forth.

Third.—The Licensee agrees to pay unto the Licensor on the fifteenth (15th) day of each month, as rent or royalty for the previous month for the machines hereby loaned, and for the use of the patents hereby licensed, for each and every pair of shoes or boots lasted by the aid of said machines or any of them, or by the use of said patents or any of them, or in the making of which any of said patents shall be used, the sum set forth in the classified schedule hereto annexed in the column headed "Royalty Value"; and said royalty is hereby agreed upon by and between the parties hereto as the just, fair and correct value to the Licensee for rental of the machines and for use of the patents and inventions hereby licensed to the Licensee by the Licensor, and that the "abated rent or royalty" hereinafter named is not the true value of the license hereby granted, but is a concession and abatement of such value for and in consideration of the conditions hereto attached, and this agreement and responsibility, and all others in this license contained shall extend to and in respect of all shoes or boots made or lasted by the aid of said machines or on any machine embracing any of the patents which the Licensee is hereby licensed to use, whether made by the Licensee or by other persons for him; provided, however, that in all cases when the Licensee shall pay to the Licensor, on or before the fifteenth day of each month, the "abated rent or royalty" as hereinafter set forth, per pair for each and every pair of shoes or boots lasted in whole or in part by the use of said machines or patents, or any of them; said payments so duly made

shall be full payment and satisfaction of the rent or royalty for the use of said machines and of the license for the use of the patents, for such shoes or boots in respect to which said payments shall have been so duly made, and it is agreed that default of payment of said rent or royalty or of any indebtedness to the Licensor when due, that is, on or before the fifteenth (15th) of each month, shall forfeit the Licensee's right to any abatement of the full rent or royalty as herein provided. And it is hereby agreed that for each and every pair of shoes and boots made or lasted by the aid of the machines hereby loaned, or made by or for the Licensee by the use of the patents hereby licensed, or any of them, and in respect of which there shall not have been paid the "abated rent or royalty" as hereinbefore set forth, the Licensee shall pay to the Licensor the rental or royalty value named in said classified schedule as liquidated, fixed, and settled damages. It is hereby agreed that the monthly rent or royalty returns shall be computed at "abated rent or royalty". In addition to these agreements relating to rent or royalty, and to the "abated rent or royalty" and to payments as liquidated damages of the full rental or royalty value, in case of neglect or default of or refusal to make payment when due, it is agreed by the Licensee that in case he becomes insolvent or makes an assignment for the benefit of creditors, or in case his property or business goes into the hands of a receiver, all rent or royalty due to the Licensor shall be at once computed at the full rent or royalty value, as expressed in the schedule of rentals or royalties herewith attached, and the Licensee expressly agrees to this computation of the rental or royalty value, and further agrees not to contest or dispute any claim for the said full rental or royalty value. It is agreed and convenanted by the Licensee that whenever requested, in writing, by the Licensor, he will pay not less than ten dollars per month, as a minimum amount of rental or royalty for the use of each Lasting Machine, except when his factory is not running. But until further notice, given in writing, it is agreed between the parties hereto that if the Licensee pays the rental or royalty on or before the fifteenth (15th) of the month following the month when the lasting was done, and otherwise keeps all the

terms of this License, there will be a discount made for such payment sufficient to reduce the cost of "abated rent or royalty" on all classes of shoes to one half cent per pair, excepting on long-legged boots, on which the abatement will be sufficient to reduce the cost to three fourths of a cent a pair, but it is specially agreed that this abatement ceases upon written notice given by the Licensor to the Licensee.

Fourth.—The Licensee agrees that the operator on each machine shall keep a daily account of the number of pairs of shoes and boots lasted by him and the class to which they belong; which account shall be signed by the operator and verified and signed by the Licensee and forwarded by the Licensee to the Licensor on the first day of each month, and rental or royalty shall be paid by the Licensee on the basis of said account. And the Licensee agrees to give the Licensor, its successors, or assigns, or its or their authorized agent or agents, free access at all times to the premises where the machines hereby loaned are stored or operated, for the purpose of verifying the operators' reports, and in case operators' reports shall not be made as above provided, it shall be the right of the Licensor to appoint a competent man to keep the accounts herein required; and all reasonable compensation for the services and expenses of such man, which shall not exceed three dollars per day, shall be at the charge of the Licensee, and the Licensee hereby agrees to pay the same.

The Licensee agrees that he will allow the Licensor, its successors, and assigns, and its or their agents at any time hereafter, to attach an indicator or counter to any machine embracing any of the patents hereby licensed, which now is or which may hereafter come into the possession of the Licensee, for the purpose of indicating the number of shoes or boots made, and to examine, modify, repair, or replace the said indicator, and that he, the Licensee, will not disturb or interfere with, nor permit anyone else to disturb or interfere with, any indicator which now is or which may be hereafter placed upon any machine as aforesaid.

Fifth.—The Licensee hereby agrees that he will not in any way violate, or infringe, or contest, the validity of any of the patents,

or any reissue or extension of the same, which he is hereby licensed to use, or the sufficiency of their specifications, or the validity of the title of the Licensor to said patents, or any of them, and expressly admits the validity and sufficiency thereof.

Sixth.—The machines cannot be transferred, and this loan and license is not assignable by the Licensee, by his own act or by operation of law.

Seventh.—The power conveyed by this license is only the right to use the said specific machines, and not the right to make, sell, or alter any machines embodying the patents aforesaid, or any of them; and a transfer or removal of the machines hereby loaned can only be made with the written consent of the Licensor; and if the Licensee is or becomes at any time insolvent or bankrupt, or if a sale, lease, transfer, alteration, or removal of said machines shall be made or attempted by the Licensee, or by operation of law, or by any legal officer, representative, or assignee, as the property of the Licensee, without the written consent of the Licensor, the possession of said machines shall thereupon revest in the Licensor, and it may take possession of said machines without the Licensee having any claim for the repayment of any part of the sum or sums which he may have paid as consideration for the delivery of this license, or for rental or royalty under this instrument, nor shall he be released thereby from any of the conditions of this agreement.

Eighth.—In case any machine hereby loaned shall remain unused for the period of four consecutive months, the Licensor may, at any time thereafter, while it remains unused, cancel this loan and license so far as relates to said unused machines, by giving written notice, as herein provided, that it has elected so to do, and, upon giving such notice, this loan and license shall be terminated to the extent aforesaid, and the possession of said unused machines shall thereupon revest in said Licensor, but in case of such cancellation and reclamation, the Licensee shall thereupon pay the Licensor the sum stated in article twelfth for deterioration of the machines by use or otherwise, and other expenses in reference to the same.

Ninth.—In case the Licensee refuses or neglects to perform, or

violates any of the conditions of this license, the Licensor shall have the right to terminate this license by giving written notice as aforesaid that it has elected so to do; and upon the giving of such notice this license shall be terminated, or upon taking or demanding possession of the machines without cancellation of this agreement, the possession of said machines shall thereupon revest in the Licensor; and upon the termination of the loan and license by lapse of time, cancellation, breach of condition, or otherwise, it shall be the duty of the Licensee forthwith to deliver the machines hereby loaned and licensed, to the Licensor in good condition, reasonable wear and tear excepted; and upon such termination or taking or demanding possession of the machines by the Licensor, and without prejudice to any other legal rights or remedies for violation of contract, use of machines without right, or use of patents without license, the Licensor or its agents may thereupon enter the premises where said machines may be, and may take and remove the same, and the Licensee shall have no claim whatever on account of any sum or sums he may have paid under this license as rent or royalty or otherwise, nor shall he be released from his agreements contained herein regarding sum due for return of machines, repairs, instruction of operators, deterioration, etc., as mentioned in article twelfth.

Tenth.—This license shall continue (unless the Licensor shall cancel this license for breach of condition) until the expiration of all the Letters Patent which the Licensee is hereby licensed to use, and which are or may hereafter be embodied in the hereby loaned machines, and the other patents or improvements referred to shall be considered as included in this license the same as if entered in this license by date and number, or any extensions or renewals of the same; and upon the expiration thereof the Licensee shall deliver to the Licensor the machines and accessories hereby loaned in good order, natural wear and tear alone excepted.

Eleventh.—In case any other machines than those now hereby loaned and licensed, embracing any of the patents hereby licensed, shall hereafter be ordered by, or come into the possession of, the Licensee then, in case the Licensor shall so elect, all the covenants herein contained shall apply to such machines, and shall govern the

parties respectively to the same extent as if the said machines had been expressly included in this loan and license. The Licensor shall give written notice of its election as aforesaid, and the entry into and under this License Agreement of all machines in possession of the Licensee is hereby specially agreed to by the Licensee, but this shall not take away the Licensor's right to refuse such entry in case of machines transferred without written consent of the Licensor.

Twelfth.—It is declared and understood that it is the intention of the Licensee to use said machines herein licensed for lasting all of the shoes and boots that shall be made by him applicable to the said machines, and not to have them in his possession as a means of reducing the price of hand-lasting, or of controlling hand-lasters, or of influencing a trade with the owners of any other Lasting Machines or of reducing the price thereof, or the prices for labor thereon, and the Licensor enters into this contract because of and by reason of such understanding and intention on the part of the Licensee. It is agreed that the Licensee shall use such machines hereby loaned for lasting all of his shoes and boots, to their full capacity, limited only by the demands of his business; and should the demands of his business require, he shall take and pay for the loan of such additional machines as may be required to do all his work; and in case any Lasting Machine in this agreement is returned to the Licensor, whether voluntarily or because of the Licensee's insolvency or the appointment of a Receiver for his business, or for non-compliance with this agreement, or otherwise, the Licensee or his assigns shall pay the Licensor one hundred (100) dollars as compensation for setting up each machine at his factory, for instructing operators, and other expenses incurred, and he shall also pay, in addition thereto, the cost of putting the machine into good condition and repair, as well as freight expense of returning the same.

Thirteenth. — It is agreed that the Licensee shall buy of the Licensor, and only of it, all the fittings and all the spare parts for repairing the machines hereby licensed, and also all the string-nail, tack-strips, or other fastenings to be driven by any appliance for lasting the shoes or boots, whether lasted in whole or in part by

the aid of any of the machines hereby licensed, or by the use of any of the said patents, or in the making of any of which any of said patents shall be used; and that the same shall be sold by the Licensor at the same prices to all Licensees for the time being. The prices and terms for the same to be fixed by the Licensor; and in all cases whenever the machines are returned to the possession of the Licensor all the accessories, which shall include all spare parts and fittings, shall be returned with the machines, free from any claim as to title, and all unused tack-strips remaining in the possession of the Licensee at the time of the return of the machines shall also be returned to the Licensor's possession free from any claim as to title, but credit for such tack-strips shall be given by the Licensor.

Fourteenth. — All the rights and interests which, under this instrument and by reason of the ownership of said machines and patents and patent rights belonging to the Licensor, shall be deemed to belong to and may be enforced by the Licensor, its representatives, and assigns, and all the stipulations binding on the Licensee shall be binding on his or their representatives or assigns.

Fifteenth. — It is agreed that this instrument may be used for Licensees of the female sex, or for corporations, and in that case the masculine pronoun denoting the Licensee shall, whenever it occurs, be instead of and indicate the feminine, or neuter, as the case may be; and also that when the party of the second part shall consist of more than one person the termination of the words relating to the said party shall be considered as singular or plural, as the sense may require; and that when the party of the second part so consists of several persons, and they sign this License and Lease for the Rental, either individually or by their firm signature, such signature or signatures shall bind them both jointly and severally to the terms and agreements herein contained, and also that the numbers of the machines named in or covered by this License and Lease may be entered herein by the Licensor after signing; and that as this instrument is designed and intended for continuous use between the parties hereto, in case the Licensee shall have more than one machine, it is agreed that the termination of words relating to the machine shall be considered as written in the singular or

plural, as the number of machines entered in this License and Lease Agreement may require.

License and Rental Lease No. *201*

This License and Rental Lease Agreement, made in duplicate the *26* day of April A. D. 18*99*, by and between the

Consolidated & McKay Lasting Machine Company,

a corporation incorporated under the laws of the State of Maine, Licensor and party of the first part, and *Riverside Shoe Co.* of *Dixon Ills*, Licensee and party of the second part, Witnesseth:

Whereas, the Licensor is now the owner of the following Letters Patent of the United States relating to Lasting Machines or auxiliary machines for lasting, to wit: No. 274,207, dated March 20, 1883, No. 281,306, dated July 17, 1883, No. 284,906, dated Sept. 11, 1883, No. 292,575, dated Jan. 29, 1884, No. 312,335, dated Feb. 17, 1885, No. 415,726, dated Nov. 26, 1889, No. 421,954, dated Feb. 25, 1890, No. 423,920, dated March 25, 1890, No. 423,-921, dated March 25, 1890, No. 423,922, dated March 25, 1890, No. 423,937, dated March 25, 1890, No. 441,482, dated Nov. 25, 1890, No. 459,899, dated Sept. 22, 1891, No. 482,349, dated Sept. 13, 1892, No. 500,141, dated June 27, 1893, No. 510,972, dated Dec. 19, 1893, No. 510,973, dated Dec. 19, 1893, No. 510,974, dated Dec. 19, 1893, No. 510,975, dated Dec. 19, 1893, No. 510,-976, dated Dec. 19, 1893, No. 510,977, dated Dec. 19, 1893, No. 510,978, dated Dec. 19, 1893, No. 518,933, dated April 24, 1894, No. 523,939, dated July 31, 1894, No. 533,394, dated Jan. 29, 1895, No. 560,767, dated May 26, 1896, No. 562,119, dated June 16,1896, No. 564,931, dated July 28, 1896, No. 567,566, dated Sept. 8, 1896, No. 584,741, dated June 15, 1897, No. 584,742, dated June 15, 1897, No. 584,743, dated June 15, 1897, No. 584,744, dated June 15, 1897, No. 579,321, dated January 11, 1898, and other patents applied for and now pending, and is, moreover, the owner of or Licensee under other patents not herein enumerated;

And, whereas, the Licensee desires the right to use, under the terms of this License and Lease Agreement, the hereinafter

described machine belonging to and owned by the Licensor, and also any improvements relating to the machine hereby licensed and leased for Rental, which may hereafter be acquired by the Licensor and attached to the machine hereby licensed and leased for Rental, or delivered to the Licensee to be used in connection therewith, and also any other machine, machinery, or device made by or for the Licensor, which may hereafter come into the possession of the Licensee :

Now, therefore, the Licensor, in consideration of Three Hundred Dollars ($300.00) to be paid for this License by the Licensee, and of the stipulations, conditions and agreements herein contained, on the part of the Licensee to be kept and performed, does license unto the Licensee, Lasting Machine No. *241*, property of the Licensor, but delivered f. o. b. cars at Beverly, Mass., into the possession of the Licensee for lasting boots and shoes at the factory of the Licensee in *Dixon* State of *Ills.* and nowhere else. Said machine is constructed in accordance with and embodies the invention or inventions or some part thereof described in said Letters Patent granted and to be granted, to which Letters Patent when granted this License and Lease agreement shall apply and the parties hereunto shall be bound relatively thereto, the same in all respects as if the patents had been granted and the numbers thereof specially enumerated in this License and Lease agreement before signing.

The Licensor does hereby license the Licensee and the operatives in his employ to use said patented machine upon the terms and conditions herein set forth, and the Licensor does hereby also license the Licensee to use the inventions of all said patents above enumerated or referred to and all reissues, renewals and extensions of the same embodied in said machine; provided, however, and this License and Lease is granted on the express conditions that the Licensee shall at all times faithfully perform all and every condition herein contained upon his part to be kept and performed, and upon breach of said conditions or any of them by the Licensee, the Licensor at its option may cancel and terminate this License and Lease Agreement and upon written notice thereof to the

Licensee or to any one in possession of or apparent control of the machine this License and Lease Agreement shall terminate and the possession of said machine may thereupon be taken by the Licensor or its duly authorized Agents.

And the following are conditions and agreements which the Licensee hereby agrees to keep and perform and upon condition of the faithful performance of which, this License and Lease agreement is granted.

First.—The Licensee agrees that the operator on this machine shall keep a daily account on blanks, furnished by the Licensor for that purpose, of the numbers of pairs of boots and shoes and the kinds thereof lasted on or by the use of said machine or by the use of any of the inventions of said patents or in the making of which any of the inventions of said patents were employed or the machine performed a part, which account shall be signed by the operator (and verified and signed by the Licensee, if requested by the Licensor) and forwarded by the Licensee to the Licensor on or before the fifth day of each and every month in each and every year during the continuance of this License and Lease Agreement, for the month then next preceding, and on or before the fifth day thereafter the Licensee shall pay to the Licensor as rent for the use of said machine and the use of any of the inventions of said patents, a sum of lawful money equal to one-half (1-2) of one cent for each and every pair of boots and shoes lasted on or by the use of said machine or by the use of any of the inventions of said patents, or in the making of which said machine performed a part, during the month then next preceding, but seventy-two (72) pairs of Misses' and Children's shall be considered equivalent to (60) pairs of other kinds.

Second.—If, for any cause, this machine shall not be in use during twelve (12) consecutive months to the extent of its earning for the said Licensor at the above mentioned rates an amount equal to or in excess of Seventy-five Dollars ($75.00), then said Licensor may by paying to the Licensee a sum of money equal to one-third (1-3) of the amount paid by him for this License, cancel and terminate this License and Lease Agreement as hereinbefore

specified, this option and condition to be independent of any other options and conditions contained in this License and Lease Agreement.

Third.—The Licensee hereby agrees that he will not in any way violate or infringe or contest the validity of any of the patents he is hereby licensed to use or the sufficiency of their specifications or the validity of the title of the Licensor to said patents or any of them.

Fourth.—This License and Lease Agreement is not assignable and shall not be assigned by the Licensee by his own act or by the operation of law.

Fifth.—The power conveyed by this License and Lease Agreement is only the right to use said machine herein enumerated and embodying any of the inventions of said patents, and not the right to make, use or sell any other machine embodying any of the inventions of the patents aforesaid; the transfer or removal of the machine hereby licensed and leased can only be made with the consent of the Licensor; and if the Licensee is or becomes at any time insolvent or bankrupt, or a sale, transfer or removal of said machine shall be made or attempted by the Licensee or by the operation of law or by any legal officer, representative, or assigns as the property of the Licensee without the consent in writing of the Licensor, this License and Lease Agreement shall at the option of said Licensor terminate and expire, and said Licensor may take possession of said machine without the Licensee or his representative having any claim for repayment of any of the sum or sums which he may have paid as consideration for the delivery of this License or for rent or royalty under this instrument.

Sixth.—The Licensee agrees that he will allow the Licensor or its Agents at any time hereafter to attach an indicator or other mechanism to any machine embracing any of the inventions of the patents hereby licensed which now is or may hereafter come into the possession of the Licensee for the purpose of recording the number of revolutions of the driving-shaft of said machine, or of otherwise indicating the quantity of boots and shoes operated by said machine or the quantity of work done by said machine, and to

examine, modify, repair or replace said indicator, and the Licensee will not disturb or interfere with, or permit anyone else to disturb or interfere with, any indicator which now is or may hereafter be placed upon a machine as aforesaid.

And the Licensee shall not add to or subtract from the machine any mechanism whatever now or hereafter organized or connected therewith by the Licensor, nor make nor allow to be made any change or alteration in the same without the consent thereto in writing of the Licensor, nor interfere with the proper operation of the machine or any mechanism forming a part thereof or attached thereto, or that may be hereafter attached thereto, and shall at all times at his own expense keep and maintain the machine in as good and efficient working order as the same now is or may hereafter be put by the Licensor, and to obtain from the Licensor or its Agents all duplicate parts for said machine whenever any are needed.

The Licensor and its Agents may at all reasonable times have convenient access to the machine to examine and inspect the same, and the use thereof, and to repair and improve or add to the same so far as it may see fit; and all the covenants, stipulations, conditions and terms of this License and Lease Agreement shall apply to all improvements which the Licensor shall hereafter add to the machine, and to all patents therefor, with the same effect as if such additional patents were enumerated in the previous list herein set forth.

Seventh.— In case the Licensee refuses or neglects to perform, or violates any of the conditions of this License and Lease Agreement, the Licensor shall have the right to terminate this License and Lease Agreement, by giving written notice as aforesaid that it has elected so to do, and, upon the giving of such notice, this License and Lease Agreement shall terminate, and it shall be the duty of the Licensee forthwith to deliver the possession of said machine to the Licensor, in good condition, reasonable wear and tear excepted, and without prejudice to any other legal rights or remedies for violation of this contract, use of machine, or use of any of the inventions of said patents without license. The Licensor

or its Agents may thereupon enter the premises wherein said machine may be, and take and remove the same, and the Licensee shall have no claim whatever on account of any sum or sums he may have paid for this License, or under this License and Lease Agreement.

Eighth.— This License and Lease Agreement shall continue (provided the Licensee keeps and performs the conditions thereof) until the expiration of all Letters Patent, or any extensions or renewals thereof, now or hereafter owned by the Licensor, or any inventions which are or shall be hereafter embodied in, or used in connection with, said machine; and, upon the expiration of all said Letters Patent, the Licensee shall, upon demand, deliver to the Licensor the machine hereby leased or rented, in good order and repair; and the Licensee shall have no claim whatsoever on account of any sum or sums that may have been paid for this License, or under this License and Lease Agreement.

All the rights and interests which, under this instrument and by reason of the ownership of said machine and patents and patent rights, belong to the Licensor, shall be deemed to belong to, and may be enforced in its name or otherwise by the Licensor, its successors and assigns and its or their representatives or assigns; all the stipulations and agreements binding on the Licensee shall be binding upon their representatives, successors or assigns.

Ninth.— It is agreed that this instrument may be used for Licensees of the female sex, or for corporations, and in that case the masculine pronoun denoting the Licensee shall, whenever it occurs, be instead of, and indicate the feminine or neuter; and also that this instrument may be used in cases where the party of the second part shall consist of more than one person, and in that case the termination of the words relating to said party shall be considered as plural or singular, as the case may require; and when said party of the second part so consists of several persons, and they sign this License and Lease Agreement, either individually or by their firm signature, such signature or signatures shall bind them, both jointly and severally, to the terms and agreements herein contained, and also that the number of the machine named in this

License and Lease Agreement may be entered by the Licensor, after signing, and that as this instrument is designed and intended for use between the parties hereto, in case the Licensee shall require more than one machine, and it is entered in this License and Lease Agreement, it is agreed that the termination of the words relating to the machine shall be construed and considered as written in the singular or plural, as the number of machines entered in this License and Lease Agreement may require.

In witness whereof, the parties aforesaid have hereunto set their hands and seals, the said parties of the second part binding themselves, their legal representatives, and assigns, to all the foregoing agreements, both jointly and severally.

1000-3-18-1898-B

License and Rental Lease No. *129 "G"*

This license and rental lease agreement, made in duplicate the *16th* day of *March* A. D. 1*900*, by and between the

Consolidated & McKay Lasting Machine Company,

a corporation incorporated under the laws of the State of Maine, Licensor and party of the first part, and *Leonard, Shaw and Dean* of *Middleboro, Mass*, Licensee and party of the second part, Witnesseth: —

Whereas, the Licensor is now the owner of the following Letters Patent of the United States relating to Lasting Machines or auxiliary machines for lasting, to wit: No. 274,207, dated March 20, 1883, No. 281,306, dated July 17, 1883, No. 284,906, dated Sept.

11, 1883, No. 292,575, dated Jan. 29, 1884, No. 312,335, dated Feb. 17, 1885, No. 415,726, dated Nov. 26, 1889, No. 421,954, dated Feb. 25, 1890, No. 423,920, dated March 25, 1890, No. 423,921, dated March 25, 1890, No. 423,922, dated March 25, 1890, No. 423,937, dated March 25, 1890, No. 441,482, dated Nov. 25, 1890, No. 459,899, dated Sept. 22, 1891, No. 482,349, dated Sept. 13, 1892, No. 500,141, dated June 27, 1893, No. 510,972, dated Dec. 19, 1893, No. 510,973, dated Dec. 19, 1893, No. 510,974, dated Dec. 19, 1893, No. 510,975, dated Dec. 19, 1893, No. 510,976, dated Dec. 19, 1893, No. 510,977, dated Dec. 19, 1893, No. 510,978, dated Dec. 19, 1893, No. 518,933, dated April 24, 1894, No. 523,-939, dated July 31, 1894, No. 533,394, dated Jan. 29, 1895, No. 560,767, dated May 26, 1896, No. 562,119, dated June 16, 1896, No. 564,931, dated July 28, 1896, No. 567,566, dated Sept. 8, 1896, No. 584,741, dated June 15, 1897, No. 584,742, dated June 15, 1897, No. 584,743, dated June 15, 1897, No. 584,744, dated June 15, 1897, and other patents applied for and now pending, and is, moreover, the owner of or Licensee under other patents not herein enumerated;

And, whereas, the Licensee desires the right to use, under the terms of this License and Lease Agreement, the hereinafter described machine belonging to and owned by the Licensor, and also any improvements relating to the machine hereby licensed and leased for Rental, which may hereafter be acquired by the Licensor and attached to the machine hereby licensed and leased for Rental, or delivered to the Licensee to be used in connection therewith, and also any other machine, machinery, or device made by or for the Licensor, which may hereafter come into the possession of the Licensee:

Now, therefore, the Licensor, in consideration of one dollar to it paid by the Licensee, the receipt whereof is hereby acknowledged, and of the agreements and conditions herein agreed upon, to be kept and performed by the Licensee, does hereby license and lease for Rental unto the Licensee the machine herein designated by its number, said machine embodying the inventions of some of the foregoing named patents: — Lasting Machine No. *2224*.

And the Licensor does hereby license and lease the Licensee and operators in his employ to use said machine, but only upon the terms and conditions herein set forth; Provided, however, and this License and Lease is granted upon the express condition that the Licensee shall faithfully keep and perform all the conditions and agreements herein contained on his part to be kept and performed, and upon breach of the same or either of them by the Licensee the Licensor may, at its option, cancel and terminate this License and Lease by giving written notice to the Licensee or to any one in possession or apparent control of the machine, that it has elected so to do, and upon the giving of such notice this License and Lease shall terminate, and upon the Licensor taking or demanding possession of this machine, as herein provided, or without cancellation of this Agreement, then the possession of said machine shall thereupon revest in the Licensor. And inasmuch as the machine is only leased and rented by the Licensor, and the Licensee pays no purchase price whatsoever for the machine, therefore the said machine does and shall continue to belong exclusively to, and remain wholly the property of, and subject only to the control of the Licensor, and the Licensee acquires no right to buy or retain said machine except by written consent of the Licensor.

Upon the termination of this License and Lease for Rental by lapse of time, cancellation, breach of contract, non-use of machine, or otherwise, the Licensee shall forthwith deliver the machine, hereby licensed and leased, to the Licensor in good condition, reasonable wear and tear excepted, and also pay to the Licensor the sum of One Hundred and Fifty (150) Dollars, as compensation for setting up the machine at his factory, for instructing operators, and deterioration.

And the following terms and conditions of the License and Lease of the machine, together with those hereinbefore expressed, the Licensee hereby agrees to keep and perform:

First. — The Licensee is by this License and Lease for Rental authorized to use the machine herein described, only by himself or operators in his direct employ, and only in *Middleboro Mass.* He shall not add to, nor subtract from, the machine any part or mechan-

ism whatever, now or hereafter organized or connected therewith by the Licensor, nor make, nor allow to be made any change or alteration in the same, without the consent thereto in writing of the Licensor, nor interfere with the proper operation of the machine, nor any mechanism forming a part thereof or attached thereto, nor any device used in connection therewith, nor remove or deface any dates, numbers, or inscriptions, now or hereafter impressed thereon, or affixed thereto by the Licensor or by its direction, and the Licensee shall at all times at his own expense keep and maintain the machine in as good and efficient working order as the same now is or may hereafter be put by the Licensor.

Second. — The Licensor and its agents shall, at all reasonable times, have access to the machine to examine and inspect the same and the use thereof, and to repair and improve the same so far as it sees fit, and all covenants, stipulations, and conditions herein contained shall apply to all improvements which the Licensor shall hereafter add to the machine, and to any patents which have or may be issued thereon, with the same effect as if the patents were enumerated in this License and Lease with the Letters Patent previously herein enumerated.

Third. — The Licensee agrees to pay unto the Licensor, on the tenth day of each month, as Rental for the previous month for the machine hereby licensed and leased, and for the use of the inventions of the patents under which a License is hereby granted, a sum of lawful money equal to one-half ($\frac{1}{2}$) of one cent for each and every pair of Misses' and Children's and five-eighths (5-8) of one cent for each and every pair of all other kinds of boots and shoes lasted by the aid of this machine, or by the use of the inventions of said patents, or any of them, or in the making of which the inventions of said patents shall be used; and should such Rental fall short of an average of Fifteen (15) Dollars per month, for any twelve (12) consecutive months (excepting months during the whole of which the factory is idle), then the Licensee agrees to pay, upon demand, such an amount as will make the average Fifteen (15) Dollars per month for such twelve (12) consecutive months.

Fourth. — The Licensee agrees that the operator on the machine hereby licensed and leased shall keep a daily account of the number of pairs of boots and shoes lasted by him, and the class to which they belong, which account shall be signed by the operator, and verified and signed by the Licensee, if so requested by the Licensor, and delivered by the Licensee to the Licensor at Boston, Mass., not later than the fifth of each month, and Rental shall be paid by the Licensee on the basis of said account, and the Licensee agrees to give the Licensor, its successors, or assigns, or its or their authorized agents, free access at all times to the premises where the machine hereby licensed and leased is located, for the purpose of verifying the operators' reports, and in case operators' reports shall not be made as provided above, it shall be the right of the Licensor to appoint a competent man to keep the accounts herein required; and all reasonable compensation for the services and expenses of such man, which shall not exceed $3 per day, shall be at the charge of the Licensee, and the Licensee hereby agrees to pay the same upon demand to the Licensor.

The Licensee agrees that he will allow the Licensor, its successors, or assigns, and its and their agents, at any time hereafter, to attach an indicator, or counter, to any machine embracing any of the patents under which a License is hereby granted, which now is or may hereafter come into possession of the Licensee, for the purpose of indicating the number of boots and shoes lasted, and to examine, modify, repair, or replace the said indicator, and that he, the Licensee, will not disturb or interfere with, nor permit any one else to disturb or interfere with, any indicator which now is or may hereafter be placed upon any machine as aforesaid.

Fifth. — The Licensee hereby agrees that he will not in any way violate, or infringe, or contest the validity of any of the patents, or any reissue, or extension of the same, under which he is hereby licensed, or the sufficiency of their specifications, or the validity of the title of the Licensor, to said patents or any of them, and hereby expressly admits the validity and sufficiency thereof as an important part of the consideration for this License and Lease for Rental.

Sixth. — This machine shall not be transferred, and this License

and Lease for Rental is not assignable by the Licensee by his own act or by operation of law.

Seventh.— The power conveyed by this License and Lease is only the right to use the said specific machine, and not the right to make, sell, or alter any machine embodying the inventions of the patents aforesaid, or any of them; and a transfer or removal of the machine hereby licensed and leased shall only be made with the written consent of the Licensor, and if the Licensee is or becomes at any time insolvent or bankrupt, or if a sale, loan, transfer, or removal of said machine shall be made or attempted by the Licensee, or by the operation of law, or by any legal officer, representative, or assignee, as the property of the Licensee, or otherwise, without the written consent of the Licensor, the Licensor may cancel and terminate this License and Lease Agreement, and then the possession of said machine shall thereupon revest in the Licensor, and it may take possession of said machine without the Licensee having any claim for the repayment of any part of the sum or sums which he may have paid as Rent or License under this instrument.

Eighth.— In case any machine hereby licensed shall remain unused for the period of four consecutive months, the Licensor may at any time thereafter, while it remains unused, cancel this License and Lease Agreement, so far as relates to said unused machine, by giving written notice, as herein provided, that it has elected so to do; and upon giving such notice this License and Lease Agreement shall be terminated to the extent aforesaid, and possession of said unused machine shall thereupon revest in said Licensor.

Ninth.— This License and Lease Agreement shall continue until cancelled by the Licensor for breach of condition or otherwise, but in case the Licensee refuses or neglects to perform, or violates any condition of this License and Lease Agreement, the Licensor shall have the right to terminate this License and Lease Agreement by giving written notice, as aforesaid, that it has elected so to do; and upon the giving of such notice for any cause whatsoever, as herein provided for, this License and Lease Agreement shall then terminate, and the possession of said machine shall thereupon revest in the Licensor, free and discharged of this License and Lease. Upon

the termination of this License and Lease by lapse of time, cancellation, breach of condition, non-use of machine, or otherwise, it shall be the duty of the Licensee forthwith to deliver the machine hereby licensed and leased to the Licensor in good condition, reasonable wear and tear excepted, and to pay to the Licensor the sum of One Hundred and Fifty (150) Dollars for each machine so delivered; and upon such termination, and without prejudice to any other legal rights or remedies for violation of contract, use of machine without right, of infringement of patents, the Licensor, or its agents, may thereupon enter the premises where said machine may be and may take and remove the same, and the Licensee shall have no claim whatsoever against the Licensor under this License and Lease Agreement.

Tenth.— The Licensee also covenants and agrees to keep this machine and accessories insured, for the benefit of the Consolidated & McKay Lasting Machine Company, to the amount of Two Hundred (200) Dollars, and to pay all taxes assessed on said machine. In case this machine is destroyed by fire, the Licensee agrees to pay to the Licensor the sum of Two Hundred (200) Dollars, as partial compensation for such destruction of machine.

Eleventh.— In case any other machine than that hereby licensed and leased, embracing the invention of any of the patents under which the License is hereby granted, shall hereafter come into the possession of the Licensee, without a written License and Lease from the Licensor, then, in case the Licensor shall so elect, all the covenants herein contained shall apply to such machine, and shall govern the parties respectively to the same extent as if the said machine had been expressly included in this License and Lease Agreement. The Licensor shall give written notice of its election, as aforesaid, within thirty (30) days after it shall have received written notice from the Licensee of the possession of such machine, but it may give such notice without having received such notice from the Licensee.

Twelfth.— It is declared and understood that it is the intention of the Licensee to use said machine herein licensed and leased for lasting all the boots and shoes made by him applicable to the said

machine, and not to have it in his possession as a means of reducing the price of hand lasting or of controlling hand lasters, or of influencing a trade with any other lasting machine not controlled by the Licensor, or the list price thereon, and the Licensor enters into this contract because of and by reason of such understanding and agreement on the part of the Licensee. It is therefore agreed that the Licensee shall use such machine hereby licensed and leased for lasting all of his boots and shoes to its full capacity, limited only by the demands of his business; and should the demands of his business require he shall take the license and lease of such additional machines as may be needed to do all his work.

Thirteenth. It is agreed that the Licensee shall buy of the Licensor, or its authorized agents, and only of it or them, the spare parts for repairing *also the wire for lasting shoes in* the machine hereby licensed and leased, and shall and does hereby accept delivery of machine at Beverly, Mass., f. o. b. cars.

Fourteenth. All the rights and interests which, under this instrument and by reason of the ownership of said machines and patents and patent rights, belong to the Licensor, shall be deemed to belong to, and may be enforced, in its name or otherwise, by the Licensor, its successors and assigns, and its or their representatives and assigns. All of the stipulations and agreements binding on the Licensee shall be binding on his or their representatives, successors, and assigns.

Fifteenth. It is agreed that this instrument may be used for Licensees of the female sex, or for corporations, and in that case the masculine pronoun denoting the Licensee shall, whenever it occurs, be instead of and indicate the feminine, or neuter, as the case may be; and also that when the party of the second part shall consist of more than one person, the termination of the words relating to the said party shall be considered as singular or plural, as the sense may require; and that when the party of the second part so consists of several persons, and they sign this License and Lease for Rental, either individually or by their firm signature, such signature or signatures shall bind them both jointly and severally to the terms and agreements herein contained, and also that

the numbers of the machines named in or covered by this License and Lease may be entered herein by the Licensor after signing; and that as this instrument is designed and intended for continuous use between the parties hereto, in case the Licensee shall have more than one machine, it is agreed that the termination of words relating to the machine shall be considered as written in the singular or plural, as the number of machines entered in this License and Lease Agreement may require.

In witness whereof, the parties aforesaid have hereunto set their hands and seals, the said parties of the second part binding themselves, their legal representatives, and assigns, to all the foregoing agreements, both jointly and severally.

Seven (7) words inserted in clause 13 before execution.

1000-3-9-1898-C

License and Rental Lease No. *19G*

This License and Rental Lease Agreement, made in duplicate the *25* day of April A. D. 18*98*, by and between the

Consolidated & McKay Lasting Machine Company,

a corporation incorporated under the laws of the State of Maine, Licensor and party of the first part, and *Brown Shoe Co.* of *St. Louis, Mo.*, Licensee and party of the second part, Witnesseth:

Whereas, the Licensor is now the owner of the following Letters Patent of the United States relating to Lasting Machines or auxiliary machines for lasting, to wit: No. 274,207, dated March 20, 1883, No. 281,306, dated July 17, 1883, No. 284,906, dated Sept. 11, 1883, No. 292,575, dated Jan. 29, 1884, No. 312,335, dated

Feb. 17, 1885, No. 415,726, dated Nov. 26, 1889, No. 421,954, dated Feb. 25, 1890, No. 423,920, dated March 25, 1890, No. 423,921, dated March 25, 1890, No. 423,922, dated March 25, 1890, No. 423,937, dated March 25, 1890, No. 441,482, dated Nov. 25, 1890, No. 459,899, dated Sept. 22, 1891, No. 482,349, dated Sept. 13, 1892, No. 500,141, dated June 27, 1893, No. 510,972, dated Dec. 19, 1893, No. 510,973, dated Dec. 19, 1893, No. 510,974, dated Dec. 19, 1893, No. 510,975, dated Dec. 19, 1893, No. 510,976, dated Dec. 19, 1893, No. 510,977, dated Dec. 19, 1893, No. 510,978, dated Dec. 19, 1893, No. 518,933, dated April 24, 1894, No. 523,939, dated July 31, 1894, No. 533,394, dated Jan. 29, 1895, No. 560,767, dated May 26, 1896, No. 562,119, dated June 16, 1896, No. 564,931, dated July 28, 1896, No. 567,566, dated Sept. 8, 1896, No. 584,741, dated June 15, 1897, No. 584,742, dated June 15, 1897, No. 584,743, dated June 15, 1897, No. 584,744, dated June 15, 1897, and other patents applied for and now pending, and is, moreover, the owner of or Licensee under other patents not herein enumerated;

And, whereas, the Licensee, desires the right to use, under the terms of this License and Lease Agreement, the hereinafter described machine belonging to and owned by the Licensor, and also any improvements relating to the machine hereby licensed and leased for Rental, which may hereafter be acquired by the Licensor and attached to the machine hereby licensed and leased for Rental, or delivered to the Licensee to be used in connection therewith, and also any other machine, machinery, or device made by or for the Licensor, which may hereafter come into the possession of the Licensee.

Now, therefore, the Licensor, in consideration of one dollar to it paid by the Licensee, the receipt whereof is hereby acknowledged, and of the agreements and conditions herein agreed upon, to be kept and performed by the Licensee, does hereby license and lease for Rental unto the Licensee the machine herein designated by its number, said machine embodying the inventions of some of the foregoing named patents:— Lasting Machine No. *1933*.

And the Licensor does hereby license and lease the Licensee and

operators in his employ to use said machine, but only upon the terms and conditions herein set forth; provided, however, and this License and Lease is granted upon the express condition that the Licensee shall faithfully keep and perform all the conditions and agreements herein contained on his part to be kept and performed; and upon breach of the same or either of them by the Licensee the Licensor may, at its option, cancel and terminate this License and Lease by giving written notice to the Licensee or to any one in possession or apparent control of the machine, that it has elected so to do, and upon the giving of such notice this License and Lease shall terminate, and upon the Licensor taking or demanding possession of this machine, as herein provided, or without cancellation of this Agreement, then the possession of said machine shall thereupon revest in the Licensor. And inasmuch as the machine is only leased and rented by the Licensor, and the Licensee pays no purchase price whatsoever for the machine, therefore the said machine does and shall continue to belong exclusively to, and remain wholly the property of, and subject only to the control of the Licensor, and the Licensee acquires no right to buy or retain said machine except by written consent of the Licensor.

Upon the termination of this License and Lease for Rental by lapse of time, cancellation, breach of contract, non-use of machine, or otherwise, the Licensee shall forthwith deliver the machine, hereby licensed and leased, to the Licensor in good condition, reasonable wear and tear excepted, and also pay to the Licensor the sum of One Hundred and Fifty (150) Dollars, as compensation for setting up the machine at his factory, for instructing operators, and deterioration.

And the following terms and conditions of the License and Lease of the machine, together with those hereinbefore expressed, the Licensee hereby agrees to keep and perform:

First.—The Licensee is by this License and Lease for Rental authorized to use the machine herein described, only by himself or operators in his direct employ, and only in *St. Louis, Mo.* He shall not add to, not subtract from, the machine any part or mechanism whatever, now or hereafter organized or connected therewith

by the Licensor, nor make, nor allow to be made, any change or alteration in the same, without the consent thereto in writing of the Licensor, nor interfere with the proper operation of the machine, nor any mechanism forming a part thereof or attached thereto, nor any device used in connection therewith, nor remove or deface any dates, numbers, or inscriptions, now or hereafter impressed thereon, or affixed thereto by the Licensor or by its direction, and the Licensee shall at all times at his own expense keep and maintain the machine in as good and efficient working order as the same now is or may hereafter be put by the Licensor.

Second.— The Licensor and its agents shall, at all reasonable times, have access to the machine to examine and inspect the same and the use thereof, and to repair and improve the same so far as it sees fit, and all covenants, stipulations and conditions herein contained shall apply to all improvements which the Licensor shall hereafter add to the machine, and to any patents which have or may be issued thereon, with the same effect as if the patents were enumerated in this License and Lease with the Letters Patent previously herein enumerated.

Third.— The Licensee agrees to pay unto the Licensor, on the tenth day of each month, as Rental for the previous month for the machine hereby licensed and leased, and for the use of the inventions of the patents under which a License is hereby granted, a sum of lawful money equal to five-sixths (5-6) of one (1) cent for each and every pair of Misses' and Children's and one (1) cent for each and every pair of all other kinds of boots and shoes lasted by the aid of this machine, or by the use of the inventions of said patents, or any of them, or in the making of which any of the inventions of said patents shall be used; and should such Rental fall short of an average of Fifteen (15) Dollars per month, for any twelve (12) consecutive months (excepting months during the whole of which the factory is idle), then the Licensee agrees to pay, upon demand, such an amount as will make the average Fifteen (15) Dollars per month for such twelve (12) consecutive months.

Fourth.— The Licensee agrees that the operator on the machine hereby licensed and leased shall keep a daily account of the number

of pairs of boots and shoes lasted by him, and the class to which they belong, which account shall be signed by the operator, and verified and signed by the Licensee, if so requested by the Licensor, and delivered by the Licensee to the Licensor at Boston, Mass., not later than the fifth of each month, and Rental shall be paid by the Licensee on the basis of said account, and the Licensee agrees to give the Licensor, its successors, or assigns, or its or their authorized agents, free access at all times to the premises where the machine hereby licensed and leased is located, for the purpose of verifying the operators' reports, and in case operators' reports shall not be made as provided above, it shall be the right of the Licensor to appoint a competent man to keep the accounts herein required; and all reasonable compensation for the services and expenses of such man, which shall not exceed $3 per day, shall be at the charge of the Licensee, and the Licensee hereby agrees to pay the same upon demand to the Licensor.

The Licensee agrees that he will allow the Licensor, its successors, or assigns, and its and their agents, at any time hereafter, to attach an indicator, or counter, to any machine embracing any of the patents under which a License is hereby granted, which now is or may hereafter come into possession of the Licensee, for the purpose of indicating the number of boots and shoes lasted, and to examine, modify, repair, or replace the said indicator, and that he, the Licensee, will not disturb or interfere with, nor permit any one else to disturb or interfere with, any indicator which now is or may hereafter be placed upon any machine as aforesaid.

Fifth.— The Licensee hereby agrees that he will not in any way violate, or infringe, or contest the validity of any of the patents, or any reissue, or extension of the same, under which he is hereby licensed, or the sufficiency of their specifications, or the validity of the title of the Licensor, to said patents or any of them, and hereby expressly admits the validity and sufficiency thereof as an important part of the consideration for this License and Lease for Rental.

Sixth.— This machine shall not be transferred, and this License

and Lease for Rental is not assignable by the Licensee by his own act or by operation of law.

Seventh.— The power conveyed by this License and Lease is only the right to use the said specific machine, and not the right to make, sell, or alter any machine embodying the inventions of the patents aforesaid, or any of them; and a transfer or removal of the machine hereby licensed and leased shall only be made with the written consent of the Licensor, and if the Licensee is or becomes at any time insolvent or bankrupt, or if a sale, loan, transfer, or removal of said machine shall be made or attempted by the Licensee, or by the operation of law, or by any legal officer, representative, or assignee, as the property of the Licensee, or otherwise, without the written consent of the Licensor, the Licensor may cancel and terminate this License and Lease Agreement, and then the possession of said machine shall thereupon revest in the Licensor, and it may take possession of said machine without the Licensee having any claim for the repayment of any part of the sum or sums which he may have paid as Rent or License under this instrument.

Eighth.— In case any machine hereby licensed shall remain unused for the period of four consecutive months, the Licensor may at any time thereafter, while it remains unused, cancel this License and Lease Agreement, so far as relates to said unused machine, by giving written notice, as herein provided, that it has elected so to do; and upon giving such notice this License and Lease Agreement shall be terminated to the extent aforesaid, and possession of said unused machine shall thereupon revest in said Licensor.

Ninth.— This License and Lease Agreement shall continue until cancelled by the Licensor for breach of condition or otherwise, but in case the Licensee refuses or neglects to perform, or violates any condition of this License and Lease Agreement, the Licensor shall have the right to terminate this License and Lease Agreement by giving written notice, as aforesaid, that it has elected so to do; and upon the giving of such notice for any cause whatsoever, as herein provided for, this License and Lease Agreement shall then terminate, and the possession of said machine shall thereupon

revest in the Licensor, free and discharged of this License and Lease. Upon the termination of this License and Lease by lapse of time, cancellation, breach of condition, non-use of machine, or otherwise, it shall be the duty of the Licensee forthwith to deliver the machine hereby licensed and leased to the Licensor in good condition, reasonable wear and tear excepted, and to pay to the Licensor the sum of One Hundred and Fifty (150) Dollars for each machine so delivered; and upon such termination, and without prejudice to any other legal rights or remedies for violation of contract, use of machine without right, of infringement of patents, the Licensor, or its agents, may thereupon enter the premises where said machine may be and may take and remove the same, and the Licensee shall have no claim whatsoever against the Licensor under this License and Lease Agreement.

Tenth.—The Licensee also covenants and agrees to keep this machine and accessories insured, for the benefit of the Consolidated & McKay Lasting Machine Company, to the amount of Two Hundred (200) Dollars, and to pay all taxes assessed on said machine. In case this machine is destroyed by fire, the Licensee agrees to pay to the Licensor the sum of Two Hundred (200) Dollars, as partial compensation for such destruction of machine.

Eleventh.—In case any other machine than that hereby licensed and leased, embracing the invention of any of the patents under which the License is hereby granted, shall hereafter come into the possession of the Licensee, without a written License and Lease from the Licensor, then, in case the Licensor shall so elect, all the covenants herein contained shall apply to such machine, and shall govern the parties respectively to the same extent as if the said machine had been expressly included in this License and Lease Agreement. The Licensor shall give written notice of its election, as aforesaid, within thirty (30) days after it shall have received written notice from the Licensee of the possession of such machine, but it may give such notice without having received such notice from the Licensee.

Twelfth.—It is declared and understood that it is the intention of the Licensee to use said machine herein licensed and leased for

lasting all the boots and shoes made by him applicable to the said machine, and not to have it in his possession as a means of reducing the price of hand lasting or of controlling hand lasters, or of influencing a trade with any other lasting machine not controlled by the Licensor, or the list price thereon, and the Licensor enters into this contract because of and by reason of such understanding and agreement on the part of the Licensee. It is therefore agreed that the Licensee shall use such machine hereby licensed and leased for lasting all of his boots and shoes to its full capacity, limited only by the demands of his business; and should the demands of his business require he shall take the license and lease of such additional machines as may be needed to do all his work.

Thirteenth.— It is agreed that the Licensee shall buy of the Licensor, or its authorized agents, and only of it or them, the spare parts for repairing the machine hereby licensed and leased, and shall and does hereby accept delivery of machine at Beverly, Mass., f. o. b. cars.

Fourteenth.— All the rights and interests which, under this instrument and by reason of the ownership of said machines and patents and patent rights, belong to the Licensor, shall be deemed to belong to, and may be enforced, in its name or otherwise, by the Licensor, its successors and assigns, and its or their representatives and assigns. All of the stipulations and agreements binding on the Licensee shall be binding on his or their representatives, successors, and assigns.

Fifteenth.— It is agreed that this instrument may be used for Licensees of the female sex, or for corporations, and in that case the masculine pronoun denoting the Licensee shall, whenever it occurs, be instead of and indicate the feminine, or neuter, as the case may be; and also that when the party of the second part shall consist of more than one person, the termination of the words relating to the said party shall be considered as singular or plural, as the sense may require; and that when the party of the second part so consists of several persons, and they sign this License and Lease for Rental, either individually or by their firm signature, such signature or signatures shall bind them both jointly and sev-

erally to the terms and agreements herein contained, and also that the numbers of the machines named in or covered by this License and Lease may be entered herein by the Licensor after signing; and that as this instrument is designed and intended for continuous use between the parties hereto, in case the Licensee shall have more than one machine, it is agreed that the termination of words relating to the machine shall be considered as written in the singular or plural, as the number of machines entered in this License and Lease Agreement may require.

In witness whereof, the parties aforesaid have hereunto set their hands and seals, the said parties of the second part binding themselves, their legal representatives, and assigns, to all the foregoing agreements, both jointly and severally.

Krewson, 514,852, Feb. 13, 1894; and also are the owners of other inventions relating to machinery and devices for the manufacture of boots and shoes, and intend to secure Letters Patent therefor, some of which inventions, patented or to be patented, are embodied in the machines, or some of them, leased to the Lessee hereunder;

And whereas, the Lessee desires the right to use, under the terms of this lease and license, the hereinafter described machinery or devices belonging to the Lessors, and also any other improvements relating to the machinery hereby leased, which may hereafter be acquired by the Lessors, and attached by or with the permission of the Lessors to the machinery hereby leased or delivered to the Lessee, to be used in connection therewith, and also any other machines, machinery or devices made by or for the Lessors, which may hereafter come into the possession of the Lessee;

Now, therefore, the Lessors, in consideration of one dollar paid by the Lessee, the receipt whereof is hereby acknowledged, and of the covenants and agreements of the Lessee hereinafter contained, do hereby lease unto the Lessee (provided the Lessee keeps and observes the covenants and conditions of this agreement) the machinery or devices described by name and number or numbers,

following, and all other machines and machinery made by or for the lessors which may hereafter come into the possession of the lessees with the written consent of the lessors and which are not the subject of another lease between the parties hereto: —

McKay Pricking Machine
McKay Heel Compressing and Loading Machine
Fisher Compressing Machine
Bresnahan Compressing Machine
Heel Trimming and Randing Machine ,
Heel Trimming and Randing (including Grinding) Machine ,
No. 2 Automatic Heel Nailing and Trimming Machine ,
Rapid Nailing Machine
Union Heel Trimmer ,
Spring Heel Trimmer ,
1 American Lightning Nailing Machine *No. 571*
American Compressing Machine
Columbia Compressing Machine ,
Automatic Heel Loading and Compressing Machine
Improved National Nailing Machine
Columbia Nailing Machine ,
Automatic Spring-heel Nailing Machine
Standard Automatic Nailing Machine ,
Standard Automatic Nailing Machine , without Pricking Attachment ,
Standard Automatic Loading or Compressing and Loading Women's Work Machine ,

And the Lessors do hereby license the Lessee to use such machines and devices, and any patented parts, mechanisms or devices connected therewith or relating thereto, whether on said machinery when the same is received, or which may be added thereto by the Lessors, and including such machines, devices and machinery as may hereafter come into the possession of the Lessee with the written consent of the Lessors, under the aforementioned patents or any patents, reissues of patents or renewals, which may hereafter be owned or acquired by the Lessors; the term of said license to be the full term of this lease; but this lease is made and this

license is granted, on the express condition that the Lessee shall faithfully keep and observe each and all of the conditions and agreements herein contained, on his part to be kept and observed; and that upon a breach of the same or either of them by the Lessee, the Lessors may, at their option, cancel and terminate this lease and license, and upon written notice thereof by the Lessors to the Lessee, or to any one in the possession or apparent control of the machines, devices or machinery, this lease and license shall terminate, and the possession of, and the full right to and control of the said machines, devices and machinery shall thereupon revest in the Lessors.

The word "machinery" as hereinafter used shall be construed as designating any and all machines, devices, tools and machinery held by the Lessee under this lease and license whether now or hereafter delivered to or in the possession of the Lessee, and the covenants and conditions of this lease shall apply to all such machines, devices, tools and machinery.

And the following are agreed to as terms and conditions of the lease and license of the machines, devices, tools and machinery which the Lessee is hereby licensed to use; all of which together with those hereinbefore expressed, the Lessee agrees to keep and perform.

First. The Lessee is by this lease and license authorized to use the "machinery", hereby leased only by himself or operatives in his direct employ and only at his factory, situate at *Columbus Ohio*

He shall not add to the "machinery," nor subtract therefrom any part, mechanism or device whatsoever now or hereafter forming a part thereof or connected therewith by the Lessors; nor make, nor allow to be made any change or alteration in the said "machinery," without the consent in writing of the Lessors, nor interfere with the proper operation of the same or any mechanism forming a part thereof or attached thereto; nor remove nor deface any dates, numbers, or inscriptions, now or hereafter impressed thereon or affixed thereto by the Lessors; and shall at all times and at his own expense keep the "machinery" in good and efficient working order and condition.

And the Lessee further agrees that he will purchase from the Lessors exclusively at the regular prices from time to time established by the Lessors, all the spare parts, forms, plates, knives, moulds, extras, devices and mechanism of every sort and kind needed or used by him in repairing, renewing, changing the styles, form of nailing, or in operating the "machinery" hereby leased.

Second. The Lessors and their agents may at all reasonable times have convenient access to the "machinery," covered by this lease to examine and inspect the same and the use thereof, and to repair and improve or add to the same so far as they may see fit; but they shall not be bound to make any repairs or improvements and the covenants, stipulations, conditions and terms of this lease shall apply to all improvements which the Lessors shall hereafter add to the same and to any patents which have been or may be issued thereon with the same effect as if the patents were included in this lease and license with the Letters Patent already referred to.

Third. The lessee agrees to pay unto the Lessors on the fifteenth day of each month, as rent or royalty for the machinery hereby leased, the sum of one half cent for each and every pair of boot or shoe heels manufactured wholly or in part by the aid or use of any of the machines or machinery hereby leased, said rent or royalty to be paid each month for all boot or shoe heels made during the preceding calendar month, and it is hereby agreed between the parties hereto that said rental or royalty at one half cent per pair is a just, fair and correct value to the Lessee of the use of said machinery, and that the abated royalty hereinafter named is not the true value of the lease and license hereby granted, but is a concession and abatement of such value for and in consideration of the conditions thereto attached; and all agreements herein shall extend to all boot or shoe heels made by or for the Lessee; provided, however, that in all cases where the Lessee shall pay the Lessors on or before the fifteenth day of each month, as an abated royalty, the sum of one quarter of a cent per pair for each and every pair of heels made during the preceding calendar month, said payment so made shall be full payment and satisfaction of said rent or royalty. And it is agreed that in default of the payment of said abated royalty,

when due, as aforesaid, the Lessee's right to an abatement of the full royalty of one half cent per pair shall thereby be forfeited, and full royalty shall be due for the same, not as penalty, but as a liquidated, fixed and settled rental and license fee for the use of said machines or machinery.

And, as the machines leased hereby are supplied to the Lessee without cash payment covering the cost of manufacture, the Lessee hereby guarantees that, during the continuation of this lease, the abated rent and royalty due and actually paid over to the Lessors under the terms hereof shall not in and for any period of three months be less than *25* dollars. But it is agreed that if, at any time during the continuance of this lease, the Lessee shall pay to the Lessors a sum equal to the amount of insurance hereinafter named, the Lessee shall, provided he has not violated any of the terms of this lease, be freed from his guarantee to pay more than the rent and royalty hereinbefore stipulated for each pair of boot or shoe heels manufactured as aforesaid, all the other terms and conditions of this lease remaining in force as before. And the Lessee cannot avail himself of the provision set forth in this paragraph for anything less than all the machines hereby leased; and he shall not be allowed any diminution of the sum to be paid because of the wear and tear or destruction of any of the machinery hereby leased.

Fourth. It is understood that the Lessors may at any time attach to said "machinery" or any part thereof an indicator, for the purpose of registering the number of boots or shoes in the manufacture of which said "machinery" is utilized, or the number of revolutions or movements of the same or any thereof; and the Lessee agrees that in case an indicator shall be attached to said "machinery" or any part thereof by the Lessors, it shall not be disturbed or interfered with by any person, and that prompt notice will be given to said Lessors in case the same shall be disturbed or inaccurate or out of repair. And the Lessee agrees to keep a full and accurate account independently of any indicators that may be placed upon the "machinery" of all boots and shoes in the manufacture of which said "machinery" is used; and the Lessee further agrees to

require each of its operators upon the "machinery" hereby leased to keep upon blanks or blank books to be furnished by the Lessors, accurate daily records of the number of pairs of boots or shoes in the making of which said "machinery" shall have been used, and to require his operator to furnish any further information called for by said blanks or blank books and to sign such daily records and to deliver them to the Lessee; and the Lessee agrees to send to the office of the Lessors on or before the fifteenth day of each month, the original records for the preceding calendar month kept by his operators as above provided for. And the Lessee agrees to allow the Lessors or their agents to have access at all times to said records kept by his operators and to all accounts kept by him, of the shoes prepared or manufactured by him.

Fifth. The Lessee hereby agrees as an essential part of the consideration for this lease and license, that he will not in any way violate or infringe or contest the validity of any of the patents hereinbefore referred to as belonging to the Lessors or which may now or hereafter be owned by the Lessors, or any reissue or extension of the same, or the title of the Lessors to said patents or any of them.

Sixth. The "machinery" held under this lease cannot be transferred, and this lease and license is not assignable by the Lessee by his own act or by operation of law. The Lessee agrees at his own expense to pay all taxes levied on said "machinery" or on account of this lease and to insure against loss by fire and to keep so insured the "machinery" held by him at any time under this lease in a sum total equal to *Two Hundred and fifty* dollars, and in case of loss or damage, the Lessee agrees to pay the full amount of the insurance to the Lessors.

Seventh. The power conveyed by this lease and license is only the right to use the said "machinery" and not the right to make or sell any "machinery" embodying the inventions of any of the patents aforesaid or any patent hereafter owned by the Lessors. And a removal of the "machinery" or any portion thereof from the factory of the Lessee can only be made with the written consent of the Lessors, and on conditions satisfactory to the Lessors; and if

the Lessee is or becomes at any time insolvent or bankrupt, or if a sale, transfer, removal or lease of said "machinery" or any portion thereof shall be made or attempted without the written consent of the Lessors, then this lease and license and all rights of the Lessee thereunder shall forthwith, at the option of the Lessors, cease and determine, and the possession of said "machinery" shall revest in the Lessors, and they may take possession of the same without the Lessee having any claim against the Lessors.

Eighth. This lease and license shall, unless cancelled by agreement of the parties hereto, continue, provided the Lessee faithfully keeps and performs the terms and conditions hereof, for seventeen years from the date hereof, and for such further time as may be covered by the term of any Letters Patent now or or hereafter owned by the Lessors, and any inventions of which are contained in any of the "machinery" hereby leased or which shall be added to or embodied in said "machinery" or used in connection therewith. But inasmuch as the "machinery" has been delivered by the Lessors to the Lessee without any charge or payment representing its cost (excepting such payments as have been made on account of moulds, dies, forms, clamps, lasts, and other parts or devices used in connection with said "machinery"), it is understood and agreed that the Lessors may at any time, in case the Lessee refuses or neglects to perform or violates any of the conditions of this lease and license, or provides himself with any other machine to do any part of the work which any of said Lessors' machines are capable of doing, terminate this lease upon giving written notice to the Lessee of their election so to do. And immediately upon such notice, this lease and license and all the rights of the Lessee thereunder shall be terminated and the title to and right of possession of said "machinery" and all said moulds, dies, forms, clamps, lasts and other parts or devices used in connection with said "machinery" shall at once vest in the Lessors free and discharged of this lease and license. And the Lessee agrees forthwith to deliver the "machinery" hereby leased and licensed, together with all moulds, dies, forms, clamps, lasts, and other parts or devices used in connection therewith to the Lessors, and to pay to the Lessors the sum of fifty

dollars for each individual machine then leased to the Lessee, and to pay in addition the expense of transporting the "machinery" to such place of business of the Lessors as the Lessors shall direct, and without prejudice to any other legal rights or remedies for violation of contract, use of "machinery" without right, or use of patents without license, which the Lessors may have; and the Lessors or their agents may forthwith enter the premises where said "machinery" or any part of it may be, and may take and remove the same, including all said moulds, dies, forms, clamps, lasts and other parts or devices used in connection therewith, and the Lessee shall have no claim whatever against the Lessors under this lease or otherwise.

In case this lease shall run for its full term, then immediately upon its expiration the Lessee shall deliver to the Lessors the "machinery" hereby leased, together with all moulds, dies, forms, clamps, lasts and other parts or devices used in connection with said "machinery", and the Lessee shall have no claim whatever to said "machinery" or to a continuation of his possession or use thereof.

Ninth. In case any other machines, devices, or machinery than those now hereby leased and licensed, embracing or to be used in connection with the inventions of any of the Letters Patent under which a license is hereby granted, or any other patents under which the Lessee may hereafter become licensed by the terms of this agreement, shall hereafter come into the possession of the Lessee without a written lease or license from the Lessors, then, in case the Lessors shall so elect, all the covenants and agreements herein contained, including the obligation to pay a monthly rental or royalty, shall apply to the same and shall govern the parties respectively to the same extent as if the same had been expressly included in this lease and license. The Lessors may write the numbers of any such "machinery" as shall hereafter come into the possession of the Lessors into this lease after the same is executed.

Tenth. All the rights and interests which under this agreement and by reason of the ownership of said "machinery" and patents and patent rights belong to the Lessors shall be deemed to belong

to and may be enforced in their name or otherwise by the Lessors' successors and assigns and their representatives and assigns. All of the stipulations and agreements binding on the Lessee shall be binding on his or their representatives and assigns.

Eleventh. It is agreed that this instrument may be used for Lessees of the female sex or for corporations, and that in that case the masculine pronoun denoting the Lessee shall, whenever it occurs, be instead of and indicate the feminine, or neuter, as the case may be; and also that this instrument may be used in cases where the Lessee shall consist of more than one person, and in that case the termination of the words relating to the Lessees shall be considered as plural or singular, as the sense may require; and that when the Lessees so consist of several persons and they sign this lease either individually or by the firm signature, such signature or signatures shall bind them both jointly and severally to the terms and agreements herein contained.

In Witness Whereof, the parties aforesaid have hereunto set their hands and seals and to another instrument of even date and like tenor, the principal Trustee being authorized to sign for himself and his associate trustee, and to do all acts hereunder, and said Lessee or Lessees under this agreement binding itself, himself, or themselves to all the foregoing agreements, both jointly and severally.

JAMES W. BROOKS
Principal Trustee.

License and Lease No. *3447.*

Transfer from Lease No.

This Lease and Agreement, made the *twenty-fifth* day of *September* A. D. 18*97*, by and between James W. Brooks, principal trustee, and Frank F. Stanley, associate trustee for the McKay Metallic Fastening Association, Lessors and parties of the first part, and *Gordon, Kiley Company, a corporation doing business in East Weymouth, Massachusetts*, Lessee and party of the second part witnesseth:

Whereas, the Lessors now are the owners of the following Letters Patent of the United States, viz: No. 147,430, E. P. Richardson, Feb. 10, 1874; No. 149,007, C. Tyson, Mar. 24, 1874; No. 149,008, C. Tyson, Mar. 24, 1874; No. 149,009, C. Tyson, Mar. 24, 1874; No. 149,010, C. Tyson, Mar. 24, 1874; No. 152,686, E. P. Richardson, June 30, 1874; No. 152,847, Knowlton & Shepherd, July 7, 1874; No. 154,129, H. Dunham, Aug. 18, 1874; No. 155,349, A. Van Wagenen, Sept. 22, 1874, No. 155,962, (reissue 7014), McKay & Fairfield, Oct. 13, 1874; No. 157,929, E. P. Richardson, Dec. 22, 1874; No. 158,107, McKay & Fairfield, Dec. 22, 1874; No. 158,763, W. S. Watson, Jan. 12, 1875; No. 159,015, Blake & McKay, Jan. 26, 1875; No. 161,280, W. A. Rogers, Mar. 23, 1875; No. 161,842, A. Van Wagenen, April 6, 1875; No. 162,087, G. McKay, April 13, 1875; No. 162,643, L. Goddu, April 27, 1875; No. 164,474, L. Goddu, May 18, 1875; No. 163,475, L. Goddu, May 18, 1875; No. 163,476, L. Goddu, May 18, 1875; No. 163,477, L. Goddu, May 18, 1875; No 164,345, C. Tyson, June 8, 1875; No. 165,470, L. R. Blake, July 13, 1875; No. 166,659, A. Van Wagenen, Aug. 10, 1875; No. 166,661, A. Van Wagenen, Aug. 10, 1875; No. 166,662, A. Van Wagenen, Aug. 10, 1875; No. 166,663, A. Van Wagenen, Aug. 10, 1875; No. 167,349, G. McKay, Aug. 31, 1875; No. 167,523, L. Goddu, Sept. 5, 1875; No. 167,760, L. Goddu, Sept. 14, 1875; No. 168,478, L. Goddu, Oct. 5, 1875; No. 169,062, F. O. Tobey,

Oct. 19, 1875; No. 169,257, L. Goddu, Oct. 26, 1875; No. 169,-429, W. Fitzgerald, Nov. 2, 1875; No. 169,463, McKay & Fairfield, Nov. 2, 1875; No. 170,085, S. Harris, Nov. 16, 1875; No. 171,300, McKay & Fairfield, Dec. 21, 1875; No. 171,609, (reissue 9315), L. Goddu, Dec. 28, 1875; No. 171,610, (reissue 7033), L. Goddu, Dec. 28, 1875; No. 172,658, E. P. Richardson, Jan. 25, 1876; No. 173,415, McKay & Fairfield, Feb. 15, 1876; No. 177,264, G. McKay, May 9, 1876; No. 178,768, S. Harris, June 13, 1876; No. 180,146, G. McKay, July 25, 1876; No. 182,434, L. Goddu, Sept. 19, 1876; No. 182,495, C. H. Trask, Sept. 19, 1876; No. 184,281, H. Dunham, Nov. 14, 1876; No. 188,354, L. Goddu, March 13, 1877; No. 188,355, L. Goddu, Mar. 13, 1877; No. 188,810, G. McKay, March 27, 1877; No. 188,874, H. Dunham, March 27, 1877; No. 190,575, L. Goddu, May 8, 1877; No. 191,874, G. McKay, June 12, 1877; No. 193,965, Kimball & Merritt, Aug. 7, 1877; No. 195,022, J. E. Kimball, Sept. 11, 1877; No. 196,179, J. Ashworth, Oct. 16, 1877; No. 198,103, L. Goddu, Dec. 11, 1877; No. 206,688, E. F. Richardson, Aug. 6, 1878; No. 207,956, H. Dunham, Sept. 10, 1878; No. 213,938, E. F. Richardson, April 1, 1879; No. 215,116, L. Goddu, May 6, 1879; No. 215,117, (reissue 9299), L. Goddu, May 6, 1879; No. 216,299, A. J. Wilbur, June 10, 1879; No. 216,789, L. Goddu, June 24, 1879; No. 217,324, L. R. Blake, July 8, 1879; No. 217,868, L. Goddu, July 29, 1879; No. 226,062, L. Goddu, March 30, 1880; No. 240,119, L. Goddu, April 12, 1881; No. 242,188, Wm. H. Cuff, May 31, 1881; No. 242,-277, Wm. H. Cuff, May 31, 1881; No. 244,046, L. Goddu, July 12, 1881; No. 250,723, L. Goddu, Dec. 13, 1881; No. 260,-141, A. Van Wagenen, June 27, 1882; No. 260,142, A. Van Wagenen, June 27, 1882; No. 260,715, A. Van Wagenen, July 4, 1882; No. 261,931, J. E. Kimball, Aug. 1, 1882; No. 262,287, L. Goddu, Aug. 8, 1882; No. 263,657, L. Goddu, Aug. 29, 1882; No. 265,227, L. Goddu, Sept. 26, 1882; No. 269,279, L. Goddu, Dec. 19, 1882; No. 287,375, L. Goddu, Oct. 23, 1883; No. 288,-421, L. Goddu, Nov. 13, 1883; No. 288,422, L. Goddu, Nov. 13, 1883; No. 288,423, L. Goddu, Nov. 13, 1883; No. 288,424, L.

Goddu, Nov. 13, 1883; No. 288,425, L. Goddu, Nov. 13, 1883; No. 289,103, W. P. Hopkins, Nov. 27, 1883; No. 301,114, L. Goddu, July 1, 1884; No. 310,816, L. Goddu, Jan. 13, 1885; No. 310,817, L. Goddu, Jan. 13, 1885; No. 329,031, H. P. Fairfield, Oct. 27, 1885; No. 329,449, L. Goddu, Nov. 3, 1885; No. 331,926, A. Van Wagenen, Dec. 8, 1885; No. 351,372, L. Goddu, Oct. 26, 1886; No. 356,107, H. Dunham, Jan. 18, 1887; No. 360,428, L. Goddu, April 5, 1887; No. 360,585, L. Goddu, April 5, 1887; No. 370,135, L. Goddu, Sept. 20, 1887; No. 370,136, L. Goddu, Sept. 20, 1887; No. 374,549, H. F. Murray, Dec. 6, 1877; No. 383,455, L. Goddu, May 29, 1888; No. 385,801, L. Goddu, July 10, 1888; No. 385,802, L. Goddu, July 10, 1888; No. 388,128, L. Goddu, Aug. 21, 1888; No. 398,606, L. Goddu, Feb. 26, 1889; No. 402,014, L. Goddu, April 23, 1889; No. 403,835, L. Goddu, May 21, 1889; No. 440,805, L. Goddu, Nov. 18, 1890; No. 456,113, L. Goddu, July 14, 1891; No. 478,055, L. Goddu, June 28, 1892; No. 478,056, L. Goddu, June 28, 1892; No. 490,621; L. Goddu, Jan. 24, 1893; No. 490,622, L. Goddu, Jan. 24, 1893; No. 490,623, L. Goddu, Jan. 24, 1893; No. 490,624, L. Goddu, Jan. 24, 1893; No. 490,625, L. Goddu, Jan. 24, 1893.

And whereas the Lessee desires to use the hereinafter described machines belonging to the Lessor, —

Now, therefore, the Lessors, in consideration of one dollar to them paid by the Lessee, the receipt whereof is hereby acknowledged, and of the stipulations and conditions hereinafter contained on the part of the Lessee to be kept and performed, do lease unto the Lessee the machines designated by their numbers in the following schedule, the said machines embodying the foregoing named patents, or some of them: —

Standard Screw Machine, No.
Cable Wire Machine, No.
Cable Wire Tacking Machine, No.
String Nail Tacking Machine, No.
Taper Nail Tacking Machine, No.
Loose Nail Tacking Machine, No.
Corrugated Wire Machine, No.

Taper Nail Attaching Machine, No.
Loose Nail Attaching Machine, No. *786.*
Universal Slugging " " *422.*

And all the machinery which the parties of the second part may hereafter order of the party of the first part, constructed according to the specifications and embodying the inventions contained in patents owned by said Trustees, applicable to said machines and machinery; and doth hereby license said parties of the second part to use said machines and machinery and also to embody and use therein any other patents, renewals and extensions thereof, which the said party of the first part may now have or may hereafter obtain, by assignment or otherwise, applicable to the said machines and machinery, for the term of the existence of said patents or of any of them, and for all renewals and extensions of them or any of them.

And the Lessors do hereby license the Lessee, and operatives in his employment, to use said patented machines, upon the terms and conditions herein set forth; provided, however, and this lease is made and this license is granted on the express Condition, that the Lessee shall faithfully keep and perform all the conditions and stipulations herein contained on his part to be kept and performed, and upon breach of the same, or either of them, by the Lessee, the Lessors may at their option, cancel and terminate this lease and license, and upon written notice thereof by the Lessors, or either of them, to the Lessee, or to any one in the possession or apparent control of the machine, this lease and license shall terminate, and possession of said machine shall thereupon revest in the Lessors.

And the following are also agreed to as terms and conditions of the lease and license of the machine which the Lessee is hereby licensed to use, all of which, together with those hereinbefore expressed, the Lessee hereby agrees to keep and perform: —

First. The Lessee is by this Lease and License authorized to use the machine hereby leased only by himself or operatives in his direct employ and only in *East Weymouth, Massachusetts.* He shall not add to nor subtract from the machine any mechanism whatever now or hereafter organized or connected therewith by the Lessors, nor

make nor allow to be made any change or alteration in the same, without the consent thereto in writing of the Lessors, nor interfere with the proper operation of the machine, nor any mechanism forming a part thereof, or attached thereto, nor remove nor deface any dates, numbers or inscriptions now or hereafter impressed thereon or affixed thereto by the Lessors, and shall at all times, at his own expense, keep and maintain the machine in as good and efficient working order as the same now is or may hereafter be put by the Lessors.

Second. The Lessors and their agents may at all reasonable times have convenient access to the machine, to examine and inspect the same and the use thereof, and to repair and improve the same so far as they may see fit; and the covenants, stipulations and conditions herein contained shall apply to all improvements which the Lessors shall hereafter add to the machine, and to all patents embodied therein, the right to use which shall be owned by the Lessors (so long as the Lessee shall use said improvements), with the same effect as if said patents were included in the list herein set forth.

Third. The Lessee agrees to pay unto the Lessors, as rent for the machine hereby leased, and for the use of the patents hereby licensed, the sum of ten cents for each and every pair of boots or shoes made by the aid of said machines or any of them, and by the use of said patents or any of them, or in the making of which any of said patents shall be used, and this agreement and responsibility, and all others in this lease contained, shall extend to and in respect of all shoes made or channelled by the aid of said machine, or on which it shall be used, although they should be made for persons other than the Lessee, or by persons other than him; and it is hereby agreed that for each and every pair of boots and shoes made by the aid of the machine hereby leased, or made or sold by or for the Lessee by the use of the patents hereby licensed, or any of them which shall not have been united by material purchased as hereinafter set forth, the Lessee shall pay to the Lessors the sum of ten cents as liquidated, fixed and settled damages, provided, however, that in all cases when the Lessee shall purchase of the

Lessors, paying therefor in cash, on delivery, the material to be used in the machine for fastening together the shoes or other work to be united, which is to be bought at prices much in excess of the cost to the Lessors, with the intent that such excess shall be the rent and license fee hereunder, such purchase and use of the uniting material shall be full payment and satisfaction of the rent for the use of said machine and of the license for the use of the patents for such boots or shoes as shall be united with the material so purchased and used; and it is agreed between the parties hereto that the price of said uniting material shall be fixed by the Lessors from time to time, and shall for all machines to be licensed by the trustees of this Association be the same for the same kind of material to be used in the same kind of machine, to all licensees in the United States, as for all like machines acquired from the Lessors.

And it is hereby agreed that for each and every pair of boots and shoes made by the aid of the machine hereby leased, or made by or for the Lessee or by the use of the patents hereby licensed, or any of them, which shall not have been united by the aforesaid material purchased of the Lessors or their agent, the Lessee shall pay to the Lessors the sum of ten cents as liquidated, fixed and settled damages.

Fourth. The Lessee hereby agrees that he will not in any way violate or infringe or contest the validity of any of the patents, or any reissue or extension of the same, which he is hereby licensed to use, or the sufficiency of their specifications, or the validity of the title of the Lessors to said patents or any of them, and expressly admits the validity and sufficiency thereof.

Fifth. The machine cannot be transferred, and this lease and license is not assignable by the Lessee, by his own act or by operation of law.

Sixth. The power conveyed by this lease and license is only the right to use the said specific machine, and not the right to make or sell any machine embodying the patents aforesaid, or any of them, and a transfer or removal of the machine hereby leased can only be made with the written consent of the Lessors; and if the Lessee is or becomes at any time insolvent or bankrupt, or if a sale, lease,

transfer or removal of said machine shall be made or attempted by the Lessee, or by operation of law, or by any legal officer, representative or assignee, as the property of the Lessee, without the written consent of the Lessors, this lease and license shall thereupon terminate and expire, and the possession of said machine shall thereupon revest in the Lessors, and they may take possession of said machine without the Lessee's having any claim for the repayment of any part of the sum or sums which he may have paid as consideration for the delivery of this lease and license, or for rent or license under this instrument; provided, however, that at any time before the Lessors shall have given a notice to terminate this lease and license as herein provided, the Lessee may deliver and surrender any or all of the machines received from the Lessors into the actual possession of the agent of the Association, at Winchester, Mass., or in such other place as the agent may direct, and in a form to be prescribed by the Lessors, relinquish all his rights hereunder, and pay all that may be due to the Lessors under this lease and license; and thereupon the agent shall then put the machine in thorough repair, and lease the machine to such applicant (if any shall apply) as he may deem a suitable person to receive a lease, collecting from him for delivery of possession under such lease such sum as in his opinion shall be just and proper, all of which sum, less the cost of repairs and other expenses actually incurred, to be made up and determined by such agent, shall be accounted for to the Lessee. The Lessee shall, on sending the machine to the agent aforesaid, sign and forward to the Lessors a request to have the machine thus re-leased, and a relinquishment of all his rights and claims on the machine under this lease, except to the avails of the re-leasing as aforesaid, in a form satisfactory to the Lessors.

Seventh. In case any machine hereby leased shall remain unused for the period of six consecutive months, the Lessor may, at any time thereafter, while it remains unused, cancel this lease by written notice so far as relates to said unused machine, but in case of such cancellation the Lessors shall thereafter pay the Lessee the price originally paid for the possession and lease, less the reason-

able cost of putting the machine in good repair, the deterioration of the machine by use or otherwise, and other expenses in reference to the same.

Eighth. In case the Lessee refuses or neglects to perform, or violates any of the conditions of this lease and license, the Lessors shall have the right to terminate this lease and license by giving written notice as aforesaid that they have elected so to do; and upon the giving of such notice this lease and license shall be terminated, and the title and possession of said machine shall thereupon revest in the Lessors, free and discharged of this lease and license; upon the termination of this lease and license by lapse of time, cancellation, breach of condition or otherwise, it shall be the duty of the Lessee forthwith to deliver the machine hereby leased and licensed to the Lessors in good condition, reasonable wear and tear excepted; and upon such termination and without prejudice to any other legal rights or remedies for violation of contract, use of machine without right or use of patents without license, the Lessors or their agents may thereupon enter the premises where said machine may be, and may take and remove the same, and the Lessee shall have no claim whatever on account of any sum or sums he may have paid for or under this lease or license.

Ninth. This lease and license shall continue (provided the Lessee complies with the terms and conditions thereof) until the expiration of all the Letters Patent which the Lessee is hereunder licensed to use, or any extensions or renewals of the same; and upon the expiration thereof the Lessee shall deliver to the Lessors the machine hereby leased in good order, natural wear and tear alone excepted; and the Lessee shall thereupon, if he has kept all the conditions of this lease, have the right to purchase said machine for the sum of one dollar.

Tenth. In case any other machines than those now hereby leased and licensed, embracing any of the patents hereby licensed, shall hereafter come into the possession of the Lessee without a written lease or license from the Lessors, then, in case the Lessors shall so elect, all the covenants herein contained shall apply to such machines, and shall govern the parties respectively to the same

extent as if the said machines had been expressly included in this lease and license. The Lessors, or one of them, shall give written notice of their election as aforesaid within thirty days after he shall have received written notice from the Lessee of the possession of such machines, but he may give such notice without having received notice from the Lessee of the possession of such machines.

Eleventh. The Lessee agrees that he will allow the Lessors or their agents, at any time hereafter, to attach an indicator or counter to any machine embracing any of the patents hereby licensed, which now is or may hereafter come into the possession of the Lessee, for the purpose of recording the number of revolutions of the cam-shaft of said machine or of indicating the quantity of uniting material used, and to examine, modify, repair or replace said indicator; and that he, the Lessee, will not disturb or interfere with, nor permit any one else to disturb or interfere with, any indicator which now is or which may be hereafter placed upon a machine as aforesaid.

Twelfth. All the rights and interests which under this instrument and by reason of the ownership of said machines and patents and patent rights belonging to the Lessors shall be deemed to belong to and may be enforced in his or their own names or otherwise by the Lessors' successors in trust, and his and their representatives and assigns, and all the stipulations binding on the Lessee shall be binding on his or their representatives.

Thirteenth. It is agreed that this instrument may be used for Lessees of the female sex, and in that case the masculine pronoun denoting the Lessee shall, whenever it occurs, be instead of and indicate the feminine; and also that this instrument may be used in cases where the party of the second part shall consist of more than one person, and in that case the termination of the words relating to the said party shall be considered as plural or singular, as the sense may require; and that when the party of the second part so consists of several persons, and they sign this lease, either individually or by their firm signature, such signature or signatures shall bind them both jointly or severally to the terms and agreements herein contained; and also that the numbers of the machines named in or covered by this lease may be entered herein by the

Lessors after signing; and that as this instrument is designed and intended for use between the parties hereto, in case the Lessee shall have more than one machine, it is agreed that the termination of words relating to the machines shall be construed and considered as written in the singular or plural, as the number of machines entered in the lease and license may require.

In witness whereof, the parties aforesaid have hereunto put their hands and seals, the principal Trustee being authorized to sign for himself and his associate and for both, to do all acts hereunder, the said parties of the second part binding themselves to all the foregoing agreements, both jointly and severally.

JAMES W. BROOKS, [SEAL]
Principal Trustee.

[RIDER ATTACHED TO PLAINTIFF'S EXHIBIT 12.]

Addition to and Modification of Lease and License No. *3447*, dated *September 25th*, 1897, from the Trustees of the McKay Metallic Fastening Association to *Gordon, Kiley Company, a corporation doing business in East Weymouth, Massachusetts.*

Inasmuch as the lessors have furnished to the lessee, without charge or payment representing its cost, the machinery which the lessee is to use under said lease and upon payment of the royalties therein specified, said machinery remains the absolute property of the lessors who have the right to remove it and also to terminate the lease and license whenever the lessee shall provide himself with any other machine to do any part of the work which said lessors' machines are, in the lessors' opinion, capable of doing or whenever, for a period of three consecutive months, the lessee shall have purchased and paid for, according to the terms of the lease, less than one hundred pounds of the fastening material required for each machine, or whenever the lessee shall alter any of said machines or machinery without consent of the lessor or shall use for repair or

replacement of any portion thereof duplicate parts obtained from any one except the lessor. The lessee agrees to pay the expense of transporting the machinery from and returning it to the lessors' shop and also the expense of repairing the same and any taxes that may be assessed thereon and further agrees to fully insure and keep insured all machines at any time held by him under this lease and license, each for the value in the following schedule named, and, in case of loss, to pay the full amount thereof to the lessor.

Insurance to be made on machines at the values named herewith.

Rapid Standard Machines . . .	$400.00 each.
Old Style Standard Machines . .	350.00 each.
Loose Nail Attaching Machines . .	250.00 each.
Slugging Machines	250.00 each.
Universal Nailing Machines . .	250.00 each.
Tacking-on Machines . . .	75.00 each.

PLAINTIFF'S EXHIBIT 13.

[Put in Evidence, page 330.]

Lease and License, No.

This Lease and Agreement made this day of A.D. by and between the Davey Pegging Machine Company, a corporation existing under the laws of Maine, Lessor, and Lessee: Witnesseth:

Whereas, the Lessor is owner of the following-described Letters Patent of the United States, viz.: —

No. 414501, November 5, 1889, to John F. Davey,
No. 504311, August 29, 1893, to John F. Davey,
No. 555434, February 25, 1896, to John F. Davey,
No. 559532, May 5, 1896, to William W. Kelly,
No. 581066, April 20, 1897, to J. F. Davey and S. W. Ladd,

and others, for improvements in pegging machines and of the inventions shown and described therein, and also is the owner of several other inventions relating to pegging machines, or to be used in connection therewith, and is constantly endeavoring to make improvements on such machines, and devices to be used therewith, and intends to secure Letters Patent therefor;

And whereas, the Lessee desires the right to use under the terms of this lease and license the hereinafter-described pegging machine or machines belonging to the Lessor, and embodying or to be used in connection with the inventions of the above-mentioned Letters Patent, and also any other patented improvements relating to the machine or machines hereby leased, and which may hereafter be acquired by the Lessor and attached to the machine or machines hereby leased or delivered to the Lessee to be used in connection therewith, and also any other machines, machinery or devices made by or for the Lessor, which may hereafter come into the possession of the Lessee.

Now, therefore, the Lessor, in consideration of one hundred dollars paid by the Lessee for each machine hereby leased, the receipt whereof is hereby acknowledged, and of the covenants and agreements of the Lessee hereinafter contained, does hereby lease unto the Lessee (provided the Lessee keeps and observes the covenants and conditions of this agreement) the pegging machine or machines, described by number or numbers, as follows, namely: —

of which numbers those numbered are delivered to the Lessee upon the execution of this lease, and also the Lessor does hereby lease all other machines, devices and machinery, made by or for the Lessor, which may hereafter come into the possession of the Lessee from or with the consent of the Lessor; and the Lessor doth hereby license said Lessee and parties in his employ to use only in the manufacture of boots or shoes, said pegging machines, devices and machinery, and any parts, mechanism or devices connected therewith, or relating thereto, whether on said machines and machinery when the same are received, or which may be added thereto by the Lessor for and during the term of this lease, and

upon the terms and conditions herein contained, and provided, however, and this lease is made and this license is granted on the express condition that the Lessee shall faithfully keep and observe each and all of the conditions and agreements herein contained on his part to be kept and observed; and that upon a breach of the same, or either of them, by the Lessee, the Lessor may, at his option, cancel and terminate this lease and license, and upon written notice thereof by the Lessor to the Lessee, or to any one in the possession or apparent control of the said machines, devices or machinery, this lease and license shall terminate, and the possession of and the full right to and control of the said machines, devices and machinery shall thereupon revest in the Lessor.

The word "Machine," as hereinafter used shall be construed as designating any and all machines, devices and machinery held by the Lessee under this lease and license, whether now or hereafter delivered to the Lessee, and the covenants and conditions of this lease shall apply to all such devices, machines and machinery.

And the following are also agreed to as terms and conditions of the lease and license of the machines, devices and machinery which the Lessee is hereby licensed to use: all of which together with those hereinbefore expressed, the Lessee agrees to keep and perform: —

First. The Lessee is by this lease and license authorized to use the machine hereby leased only by himself or operatives in his direct employ, and only in his factory situate at

He shall not add to the machine nor subtract therefrom any mechanism whatever, now or hereafter, forming a part thereof or connected therewith by the Lessor; nor make nor allow to be made any change or alteration in the said machine without the consent, in writing, of the Lessor, nor interfere with the proper operation of the same, or any mechanism forming a part thereof or attached thereto; nor remove nor deface any dates, numbers or inscriptions now or hereafter impressed thereon or affixed thereto by the Lessor; and shall, at all times and at his own expense, keep the machine in as good and efficient working order as the same now is or may here-

after be put by the Lessor, and shall purchase of the Lessor all spare parts used in repairing the machine.

Second. The Lessor and his agents may, at all reasonable times, have convenient access to the machine covered by this lease to examine and inspect the same and the use thereof, and to repair and improve or add to the same, so far as they may see fit; but he shall not be bound to make any repairs or improvements, and the covenants, stipulations, conditions, and terms of this lease shall apply to all improvements which the Lessor shall hereafter add to the same, and to any patents which have or may be issued thereon, with the same effect as if the patents were included in this lease and license with the Letters Patent already referred to.

Third. The Lessee agrees to pay unto the Lessor, on the fifteenth day of each month, as rent or royalty for the machine hereby leased, the sum of two cents for each and every pair of boots or shoes, of any kind, pegged by the aid or use of said machine, or in the pegging or manufacture of which said machine is utilized, said rent or royalty above referred to to be paid on the fifteenth day of each month, for all boots or shoes in the making or manufacture of which said machine shall have been used during the preceding calendar month; and it is hereby agreed between the parties hereto that said rental or royalty, of two cents per pair of boots or shoes, is a just, fair, and correct value to the Lessee of the use of the machine hereby leased to the Lessee, and that the abated royalty of three-quarters cent per pair, hereinafter named, is not the true value of the license hereby granted, but is a concession and abatement of such value for and in consideration of the conditions thereto attached; and this agreement and responsibility, and all others in this lease contained, shall extend to and in respect of all boots or shoes pegged by the aid of said machine, or in the making or manufacture of which said machine shall have been used, whether made by the Lessee or by other persons for him; provided, however, that in all cases where the Lessee shall pay the Lessor, on or before the fifteenth day of each month, three-quarters cent per pair for each and every pair of boots or shoes, of any kind, pegged in whole or in part, by the aid or use of said machine, or in the manu-

facture of which said machine shall have been utilized, said payment so duly made, shall be full payment and satisfaction of the rent or royalty for the use of the patents for such boots and shoes in respect to which said payments shall have been so duly made. And it is agreed that, in the default of the payment of said royalty when due, that is, on or before the fifteenth day of each month, the Lessee's right to an abatement of the full royalty of two cents per pair, as herein provided, shall thereby be forfeited; and it is agreed that, for each and every pair of boots or shoes pegged by the aid of said machine, or in the manufacture of which said machine shall have been used, and in respect to which there shall not have been paid the abated rent or royalty, in accordance with the terms hereinbefore set forth, the Lessee shall pay to the Lessor the sum of two cents, as liquidated, fixed and settled damages. The Lessee hereby guarantees that the abated royalty, due and paid over to the Lessor under the terms herein, shall not be less than ten dollars for each machine, for each calendar month, and in case said abated royalty, in any month, shall be less than ten dollars for each machine, then the Lessee agrees to pay to the Lessor, at the time for the payment of the abated royalty, whatever additional sum may be necessary to bring the abated royalty for that month up to ten dollars for each machine.

Fourth. It is understood that the Lessor may, at any time, attach to said machine an indicator, for the purpose of registering the number of boots or shoes pegged upon said machine, or the number of revolutions or movements of said machine; and the Lessee agrees that in case an indicator shall be attached to said machine by the Lessor, it shall not be disturbed or interfered with by any person, and that prompt notice will be given to said Lessor in case the same shall be disturbed, or inaccurate, or out of repair. And the Lessee agrees to keep a full and accurate account, independently of any indicator that may be placed upon the machine, of all boots and shoes which shall be pegged upon said machine, or in the manufacture of which said machines shall have been used; and the Lessee further agrees to require each of its operators upon the machine hereby leased to keep, upon blanks to be furnished by the Lessor,

accurate accounts of the number of pairs of boots or shoes pegged by him each day upon said machine, or in the making of which said machine shall have been used, and to require his operator to sign such daily records, and deliver them daily to the Lessee, and such account shall be verified by the oath of the operator, if the Lessor shall so require, and the Lessee also agrees to send to the office of the Lessor, on or before the tenth day of each month, a written report for the preceding calendar month of the number of pairs of boots or shoes pegged upon or with the aid of said machine, or in the pegging of which said machine shall have been used, together with the records kept by his operators as above provided for. And the Lessee agrees to allow the Lessor or his agents to have access, at all times, to said records kept by his operators, and to the accounts kept by him of the shoes pegged or manufactured on the machines leased hereby.

Fifth. The Lessee hereby agrees that he will do all the pegging of boots and shoes manufactured by him upon the said machines of the Lessor which are leased hereby, and that in case he has too much work for the machines hereby leased, he will take from the Lessor, under this lease or a similar lease containing the same terms and provisions, sufficient additional machines to perform the work, which machines shall be in all respects subject to this lease and license as if at the date hereof delivered to the Lessor and named herein.

Sixth. The Lessee hereby agrees that he will not in any way violate or infringe or contest the validity of any of the patents hereinbefore referred to, or now or hereafter owned by the Lessor, or any reissue or extension of the same, or the title of the Lessor to said patents or any of them, and expressly admits the validity and sufficiency thereof, and that the claims are to be construed broadly.

Seventh. This machine cannot be transferred, and this lease and license is not assignable by the Lessee, by his own act or by operation of law. The Lessee agrees to insure and to keep insured each pegging machine held by him, at any time under this lease, in

the sum of $200, and in case of loss or damage the Lessee agrees to pay the full amount of the insurance to the Lessor.

Eighth. The power conveyed by this lease and license is only the right to use the said machine, and not the right to make or sell any machine embodying the inventions of the patents aforesaid, or any patent hereafter owned by the Lessor. And a removal of the machine from the factory of the Lessee can only be made with the written consent of the Lessor, and on conditions satisfactory to the Lessor; and if the Lessee is or becomes at any time insolvent or bankrupt, or if a sale, transfer, or lease of said machine, devices or machinery shall be made or attempted without the written consent of the Lessor, then this lease and license, and all rights of the Lessee thereunder shall forthwith, at the option of the Lessor, cease and determine, and the possession of said machine shall revest in the Lessor, and he may take possession of the same without the Lessee having any claim against the Lessor.

Ninth. In case the Lessee refuses or neglects to perform or violates any of the conditions of this lease and license, the Lessor shall have the right to terminate this lease and license by giving written notice that he has elected so to do; and immediately upon such notice this lease and license and all the rights of the Lessee thereunder shall be terminated, and the possession of said machine shall thereupon revest in the Lessor, free and discharged of this lease and license. Upon the termination of this lease and license, by the non-performance or breach on the part of the Lessee of any condition or agreement to be kept or performed by the Lessee under the terms hereof, it shall be the duty of the Lessee forthwith to deliver the machine hereby leased and licensed to the Lessor, and to pay to the Lessor the sum of one hundred dollars for each machine hereby leased, and to pay in addition the expense of transporting the machine to such place of business of the Lessor as the Lessor shall direct, and without prejudice to any other legal rights or remedies for violation of contract, use of machine without right or use of patents without license; and the Lessor or his agents may forthwith enter the premises where said machine may be and may

take and remove the same, and the Lessee shall have no claim whatever against the Lessor.

Tenth. This lease and license shall continue, provided the Lessee faithfully keeps and performs the terms and conditions thereof, until the expiration of the Letters Patent above referred to, and until the expiration of any extensions or renewals thereof, and the expiration of any Letters Patent now or hereafter owned by the Lessor, any inventions of which shall be added to or embodied in said machines, or used in connection therewith.

In case this lease shall run for its full term, then immediately upon its expiration the Lessee shall deliver to the Lessor the machine hereby leased, and the Lessee shall have no claim whatever to said machine or to a continuation of his possession or use thereof.

Eleventh. In case any other machines, devices, or machinery than those now hereby leased and licensed, embracing or to be used in connection with the inventions of any of the Letters Patent under which a license is hereby granted, or any other patents under which the Lessee may hereafter become licensed by the terms of this agreement shall hereafter come into the possession of the Lessee without a written lease or license from the Lessor, then, in case the Lessor shall so elect, all the covenants and agreements herein contained, including the obligation to pay a monthly rental or royalty, shall apply to the same and shall govern the parties respectively to the same extent as if the same had been expressly included in this lease and license. The Lessor may write the numbers of any such machines as shall hereafter come into the possession of the Lessee into this lease, after the same is executed.

Twelfth. All the rights and interests which, under this agreement and by reason of the ownership of said machines and patents and patent rights, belong to the Lessor, shall be deemed to belong to, and may be enforced, in his name or otherwise, by the Lessor's successors and assigns, and its or their representatives and assigns. All of the stipulations and agreements binding on the Lessee shall be binding on his or their representatives and assigns.

Thirteenth. It is agreed that this instrument may be used for Lessees of the female sex, or for corporations, and that in that

case the masculine pronoun denoting the Lessee shall, whenever it occurs, be instead of and indicate the feminine, or neuter, as the case may be; and also that this instrument may be used in cases where the Lessee shall consist of more than one person, and in that case the pronouns and the termination of the words relating to the Lessees shall be considered as plural or singular, as the sense may require; and that when the Lessees so consist of several persons, and they sign this lease either individually or by the firm signature, such signature or signatures shall bind them both jointly and severally to the terms and agreements herein contained.

In Witness Whereof, the parties aforesaid have hereunto set their hands and seals and to another instrument of even date and like tenor, said Lessee or Lessees, under this agreement, binding itself, himself, or themselves to all the foregoing agreements, both jointly and severally.

PLAINTIFF'S EXHIBIT 14.

[Put in Evidence, page 333.]

Lasting Machine Department. [Form 1200-300-½.]

Lease and License Number *761*.

Consolidated Hand Method Machine.

This Lease and Agreement made at Boston, in the State of Massachusetts, this *fourteenth* day of *December* 19*00*, between the United Shoe Machinery Company, a corporation organized under the laws of the State of New Jersey, having an office in said Boston, hereinafter referred to as the lessor, of the one part, and *R. E. Larcom* of *Beverly* in the State of *Massachusetts*, hereinafter referred to as the lessee, of the other part:

Witnesseth, that the lessor, in consideration of the covenants and agreements on the part of the lessee herein contained, does hereby lease to and license the lessee under its patents to use

Consolidated Hand Method Lasting Machine No. *982*,

now or hereafter delivered to the lessee, and any duplicate parts, extras, mechanisms and devices relating thereto, or used in connection therewith, now attached to or delivered with the said

designated machine, or which may at any time hereafter be obtained from the lessor, or be added thereto with the consent of the lessor (which machine, together with all duplicate parts, extras, mechanisms and devices, held by the lessee under these presents, whether now or hereafter delivered to or in the possession of the lessee, is hereinafter referred to as the "leased machinery"), subject to the conditions hereinafter contained.

And that the following are agreed to as conditions of the lease and license of the leased machinery, all of which the lessee covenants and agrees to keep and perform: —

One. The leased machinery shall at all times remain and be the sole and exclusive property of the lessor, and the lessee shall have no right of property therein but only the right to use the same, upon the conditions herein contained. The leased machinery shall be used only by the lessee himself, or by operatives in his direct employ, and only in the factory now occupied by him at *Beverly* in the State of *Massachusetts*. The leased machinery shall not be transferred or delivered or sublet to any other person or corporation, and neither the lease nor the license hereby granted can be assigned by the lessee by his own act or by operation of law. If the lessee becomes insolvent or bankrupt, or has a receiving order made against him, or makes or executes any bill of sale, deed of trust or assignment for the benefit of his creditors, or if a sale or lease or removal of the leased machinery, or any part thereof, without the consent in writing of the lessor, be made or attempted, or if any distress or execution or attachment be levied thereon, then and in each such case this lease and license and any other lease or license then existing between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, shall at the option of the lessor cease and determine, and the possession of and full right to and control of all the leased machinery, and any machinery held by the lessee under any other lease or license from the lessor, whether as the result of assignment to the lessor or otherwise, shall thereupon revest in the lessor free from all claims or demands whatsoever. The lessor and its agents and employees shall at all times be given access to the leased machinery for the

purpose of inspecting it or watching its use and operation, or of altering, repairing, improving, or adding to it, or determining the nature or extent of its use, and the lessee shall afford all reasonable facilities therefor.

Two. The lessee shall at all times and at his own expense keep the leased machinery in good and efficient working order and condition, and shall not permit anyone to injure or deface or remove any plate, or dates, numbers, or other inscriptions now or hereafter impressed on or affixed to the leased machinery by the lessor. The lessee shall obtain from the lessor exclusively, and shall pay therefor at the regular prices from time to time established by the lessor, all the duplicate parts, extras, mechanisms and devices of every kind needed or used in operating, repairing, or renewing the leased machinery, and the same shall form part of the leased machinery, and the lessee shall not otherwise make or allow to be made any addition, subtraction, or alteration to, from, or in the leased machinery without the consent in writing of the lessor, nor interfere with the proper operation of the same.

Three. The lessee shall pay all taxes and assessments which shall be levied in respect to the leased machinery, or in respect to this lease and license, or the right to payments hereunder upon whomsoever assessed.

Four. The lessee shall use the leased machinery to its full capacity on all boots, shoes, and other footwear made in his factory in the manufacture of which it can be used.

Five. The lessee shall pay to to the lessor immediately after the execution hereof as a lease premium the sum of *fifty* dollars, and the lessee shall also pay to the lessor on the last day of each calendar month as rent or royalty the sum of one (1) cent for each pair of boots, shoes or other footwear, or portions thereof, lasted or manufactured or prepared during the next preceding calendar month in any way, whether wholly or in part, by the aid of the leased machinery or any part thereof; **provided, however, that in all cases when the lessee shall pay to the lessor on or before the fifteenth day of the calendar month the rent or royalty due for the use of the leased machinery for the next preceding calendar**

month, the lessor will in consideration of such prompt payment grant a discount of fifty per cent from such rent or royalty due for such preceding calendar month. Seventy-two pairs of misses' and children's boots, shoes or other footwear shall be considered equivalent to sixty (60) pairs of other kinds. If, for any cause, the leased machinery shall not be in use for twelve (12) consecutive months to the extent of its earning for the lessor at the rental and royalty herein provided to be paid (less all abatements) an amount equal to or in excess of seventy-five dollars ($75), then the lessor may, by paying to the lessee a sum equal to one-third (⅓) of the sum paid by him as the lease premium hereunder, cancel and terminate this lease and license, and this option and condition shall be independant of any other options and conditions in this lease and license contained.

Six. The lessor may attach to the leased machinery, or any thereof, an indicator or indicators to register the number of revolutions or movements of any part or parts thereof, and the lessee shall not allow any person (other than the lessor or its agents) to disturb or interfere with such indicator or indicators. In case any indicator thus attached shall from any cause cease to correctly indicate or register, or shall be disturbed or out of repair, or if the glass covering any such indicator shall be removed or broken or injured, then, and as often as the same shall happen, the lessee shall immediately, by writing, notify the lessor, and at the same time explain the circumstances under which the same has happened. In case any such indicator ceases to indicate, or becomes or remains inaccurate, or the glass covering becomes or remains removed, broken, or injured, because of any fault of the lessee or anyone in his employ, or because of the failure of the lessee to give promptly the notice hereinbefore provided for, then, without prejudice to any other rights of the lessor hereunder, the lessee shall pay the lessor as rent or royalty, without the right to any discount, the sum of one cent per pair for each pair of boots, shoes or other footwear, or portions thereof, in the manufacture of which the leased machinery or any part thereof shall have been used. The lessee shall keep full and accurate accounts, independently of any

indicators that may be placed upon the leased machinery, showing the number of boots, shoes, and other footwear, or portions thereof, in the manufacture of which the leased machinery or any part thereof shall have been used, and shall allow the lessor at all times, by its agents or attorneys, to examine and to take copies of such accounts and entries of the lessee as may serve to determine the total number of boots, shoes, or other footwear or portions thereof made by the aid of the leased machinery or any part thereof, and the lessee shall produce all such accounts and entries upon request. The lessee shall require each of his operators upon the leased machinery or any part thereof to keep upon blanks or blank books to be furnished by the lessor accurate daily records of the number of boots, shoes, and other footwear, or portions thereof, in the making of which he has used the leased machinery or any part thereof, and shall require his operators to sign such records, and if requested so to do by the lessor, shall verify the same under oath, and shall also furnish any further information called for by said blanks or blank books; and the lessee shall send to the office of the lessor in Boston, on or before the fifth day of each calendar month the original records for the next preceding calendar month kept by his operators as above provided for; and in case, in any calendar month, none of the leased machinery has been used, the lessee shall notify the lessor in writing of that fact, on or before the fifth day of the next succeeding calendar month.

And that the following agreements, stipulations, and provisions are agreed to:—

Seven. If at any time the lessee shall fail or cease to use exclusively lasting machinery held by him under lease from the lessor for lasting all boots, shoes, and other footwear made by or for him which are lasted by the aid of machinery, the lessor, although it may have waived or ignored prior instances of such failure or cessation, may, at its option, terminate forthwith by notice in writing this lease and license and any other lease or license of lasting machines, lasting machinery or lasting devices then existing between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise; and the possession of and full right to and

control of all lasting machines, lasting machinery or lasting devices held by the lessee under lease or license from the lessor or its assignors shall thereupon revest in the lessor free from all claims and demands whatsoever.

Eight. This lease and license shall continue, unless sooner terminated by the lessor because of breach thereof on the part of the lessee, or otherwise as herein provided, for seventeen years from the date hereof. But if any breach or default shall be made in the observance of any one or more of the conditions herein contained or contained in any other lease or license agreement subsisting between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, and expressed to be obligatory upon the lessee, the lessor shall have the right, by notice in writing to the lessee, to terminate forthwith this lease and license, and also if the lessor so elects any other lease or license agreements then in force between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, and this notwithstanding that previous breaches or defaults may have been unnoticed, waived, or condoned by or on behalf of the lessor. If, upon the expiration of the full term of this lease, the lessor does not request the return of the leased machinery, then the leased machinery shall continue to be held and used under and in accordance with the conditions of this lease and license, which shall thereupon be extended indefinitely as to term; but thereafter either the lessee or the lessor, upon sixty days' notice in writing to the other, may terminate this lease and license, whereupon the leased machinery shall be delivered forthwith to the lessor, as herein provided. Upon the expiration or termination of this lease and license or any extension thereof by notice or by reason of any default on the part of the lessee as to the terms of this lease and license or any other lease or license from the lessor, or otherwise as herein provided, the lessee shall forthwith deliver the leased machinery to the lessor at its office or factory in good order, reasonable wear and tear alone excepted; and the lessee, for himself, his heirs, executors and administrators, hereby grants to the lessor, its successors and assigns, full right, power, and authority

to enter upon the premises and into any factory, room, or any place where the leased machinery or any part thereof may be, and take possession thereof, and take away the same; and the lessee shall have no claim for the repayment of any sum or sums, or any part thereof, which he shall have paid as consideration for the grant of this lease and license or for rent or royalty, or otherwise in respect to the leased machinery.

Nine. A notice in writing, signed by the president, a vice-president, or the treasurer of the lessor, or by any assignee of the lessor's rights hereunder, and posted by prepaid letter, addressed to the lessee or delivered at his usual or last known place of abode or business, that the lease and license hereby granted is determined or shall be determined at the expiration of a certain period, shall be a sufficient determination of the lease and license from the time of posting or delivering such notice, or from the expiration of the period therein mentioned, as the case may be. Any termination of this lease and license shall not release the lessee from his obligation to pay rent or royalty for the period prior to such termination, and shall be without prejudice to any other rights or remedies which the lessor may have for violation of contract, use of machines without right, or use of patented inventions without license.

Ten. The lessee admits the validity of each and every of the Letters Patent of the United States of America, owned by the lessor or under which it is licensed, any of the inventions of which are or hereafter may be embodied in the leased machinery. The lessee also agrees that he will not directly or indirectly infringe or contest the validity of, or the title of the lessor to, any of the patents referred to in the "Schedule of Patents" hereto annexed. The termination or cessor of this lease and license from any causs whatever shall not in any way affect the provisions of this clause, or release or discharge the lessee from the admission and estoppel herein set forth.

Eleven. None of the terms or conditions of this lease and license shall be held to have been waived by any act or knowledge of the lessor, its agents or employees, but only by an instrument in writ-

ing, signed by the president, a vice-president, or the treasurer of the lessor.

Twelve. The term "lessor" shall include the said United Shoe Machinery Company, and its successors and assigns. All the conditions and agreements binding on the lessee shall be binding on and enforceable against his legal representatives. In the construction of this instrument, words relating to the number and gender of the parties shall be read according to their real number and gender.

In Witness Whereof, the parties hereto have duly executed this instrument in duplicate, the day and year first above written.

Lasting Machine Department. [Form 1200—W. & T.—5/8].

Lease and License No. *227G*.

Consolidated Hand Method Machine.

This Lease and Agreement made at Boston, in the State of Massachusetts, this *sixth* day of *April* 1901, between the United Shoe Machinery Company, a corporation organized under the laws of the State of New Jersey, having an office in said Boston, hereinafter referred to as the lessor, of the one part, and *Keighley-Mullen Company* of *Vineland* in the State of *New Jersey*, hereinafter referred to as the lessee, of the other part:

Witnesseth, that the lessor in consideration of the covenants and agreements on the part of the lessee herein contained, does hereby lease to and license the lessee under its patents to use

Consolidated Hand Method Lasting Machine No. *1888*,

now or hereafter delivered to the lessee, and any duplicate parts, extras, mechanisms and devices relating thereto, or used in connection therewith, now attached to or delivered with the said designated machine, or which may at any time hereafter be obtained from the lessor, or be added thereto with the consent of the lessor (which machine, together with all duplicate parts, extras, mechanisms and devices, held by the lessee under these presents, whether now or hereafter delivered to or in the possession of the lessee, is hereinafter referred to as the "leased machinery"), subject to the conditions hereinafter contained.

And that the following are agreed to as conditions of the lease and license of the leased machinery, all of which the lessee covenants and agrees to keep and perform: —

One. The leased machinery shall at all times remain and be the sole and exclusive property of the lessor, and the lessee shall have no right of property therein but only the right to use the same, upon the conditions herein contained. The leased machinery shall be used only by the lessee himself, or by operatives in his direct employ, and only in the factory now occupied by him at *Vineland* in

the State of *New Jersey*. The leased machinery shall not be transferred or delivered or sublet to any other person or corporation, and neither the lease nor the license hereby granted can be assigned by the lessee by his own act or by operation of law. If the lessee becomes insolvent or bankrupt, or has a receiving order made against him, or makes or executes any bill of sale, deed of trust or assignment for the benefit of his creditors, or if a sale or lease or removal of the leased machinery, or any part thereof, without the consent in writing of the lessor, be made or attempted, or if any distress or execution or attachment be levied thereon, then and in each such case this lease and license and any other lease or license then existing between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, shall at the option of the lessor cease and determine, and the possession of and full right to and control of all the leased machinery, and any machinery held by the lessee under any other lease or license from the lessor, whether as the result of assignment to the lessor or otherwise, shall thereupon revest in the lessor free from all claims or demands whatsoever. The lessor and its agents and employees shall at all times be given access to the leased machinery for the purpose of inspecting it or watching its use and operation, or of altering, repairing, improving, or adding to it, or determining the nature or extent of its use, and the lessee shall afford all reasonable facilities therefor.

Two. The lessee shall at all times and at his own expense keep the leased machinery in good and efficient working order and condition, and shall not permit anyone to injure or deface or remove any plate, or dates, numbers, or other inscriptions now or hereafter impressed on or affixed to the leased machinery by the lessor. The lessee shall obtain from the lessor exclusively, and shall pay therefor at the regular prices from time to time established by the lessor, all the duplicate parts, extras, mechanisms and devices of every kind needed or used in operating, repairing, or renewing the leased machinery, and the same shall form part of the leased machinery, and the lessee shall not otherwise make or allow to be made any addition, subtraction, or alteration to, from, or in the leased ma-

chinery without the consent in writing of the lessor, nor interfere with the proper operation of the same.

Three. The lessee shall at his own expense insure the leased machinery against loss by fire, and keep the same insured to the amount of Two Hundred (200) Dollars, and in case the same is lost or destroyed by fire, or otherwise, before the expiration or termination of this lease, then the lessee shall pay to the lessor upon demand the sum of Two Hundred (200) Dollars as partial compensation for such loss or destruction. The lessee shall pay all taxes and assessments which shall be levied in respect to the leased machinery, or in respect to this lease and license, or the right to payments hereunder upon whomsoever assessed.

Four. The lessee shall use the leased machinery to its full capacity on all boots, shoes, and other footwear made in his factory in the manufacture of which it can be used, but the leased machinery shall not, nor shall any part thereof, be used in the manufacture of any boots, shoes, or other footwear which are or shall be welted, or the soles stitched on welt sewing or sole stitching machines not leased to the lessee by the lessor or its assignor, or in the manufacture of any turn boots, shoes, or other footwear, the soles of which are or shall be attached to their uppers by turn sewing machines, not leased to the lessee by the lessor or its assignor.

Five. The lessee shall pay to the lessor on the last day of each calendar month as rent or royalty the sum of one (1) cent for each pair of misses' and children's and one and one quarter (1¼) cents for each pair of all other kinds of boots, shoes or other footwear, or portions thereof, lasted or manufactured or prepared during the next preceeding calendar month in any way, whether wholly or in part, by the aid of the leased machinery or any part thereof; **provided, however, that in all cases when the lessee shall pay to the lessor on or before the fifteenth day of the calendar month the rent or royalty due for the use of the leased machinery for the next preceding calendar month, the lessor will in consideration of such prompt payment grant a discount of fifty per cent from such rent or royalty due for such preceding calendar month.** The lessee guarantees that the rent or royalty herein provided (less all

abatements) shall amount in each calendar year, ending December 31, to at least fifteen (15) dollars for each calendar month and at the end of each such calendar year the lessee shall pay to the lessor the amount, if any, by which the rent or royalty paid for said year is less than such guaranteed rent or royalty; provided, however, that if in any calendar year the factory of the lessee remains wholly idle for any entire calendar month, then the amount of rent or royalty guaranteed for that year shall be reduced by one twelfth for each such month that the factory thus remains wholly idle.

Six. The lessor may attach to the leased machinery, or any thereof, an indicator or indicators to register the number of revolutions or movements of any part or parts thereof, and the lessee shall not allow any person (other than the lessor or its agents) to disturb or interfere with such indicator or indicators. In case any indicator thus attached shall from any cause cease to correctly indicate or register, or shall be disturbed or out of repair, or if the glass covering any such indicator shall be removed or broken or injured, then, and as often as the same shall happen, the lessee shall immediately, by writing, notify the lessor, and at the same time explain the circumstances under which the same has happened. In case any such indicator ceases to indicate, or becomes or remains inaccurate, or the glass covering becomes or remains removed, broken, or injured, because of any fault of the lessee or anyone in his employ, or because of the failure of the lessee to give promptly the notice hereinbefore provided for, then, without prejudice to any other rights of the lessor hereunder, the lessee shall pay the lessor as rent or royalty, without the right to any discount, one and one quarter (1¼) cents per pair for each pair of boots, shoes, or other footwear, or portions thereof, in the manufacture of which the leased machinery or any part thereof shall have been used. The lessee shall keep full and accurate accounts, independently of any indicators that may be placed upon the leased machinery, showing the number of boots, shoes, and other footwear, or portions thereof, in the manufacture of which the leased machinery or any part thereof shall have been used, and shall allow the lessor at all times, by its agents or attorneys, to examine and to take

copies of such accounts and entries of the lessee as may serve to determine the total number of boots, shoes, or other footwear or portions thereof made by the aid of the leased machinery or any part thereof, and the lessee shall produce all such accounts and entries upon request. The lessee shall require each of his operators upon the leased machinery or any part thereof to keep upon blanks or blank books to be furnished by the lessor accurate daily records of the number of boots, shoes, and other footwear, or portions thereof, in the making of which he has used the leased machinery or any part thereof, and shall require his operators to sign such records, and if requested so to do by the lessor, shall verify the same under oath and shall also furnish any further information called for by said blanks or blank books; and the lessee shall send to the office of the lessor in Boston, on or before the fifth day of each calendar month the original records for the next preceding calendar month kept by his operators as above provided for; and in case, in any calendar month, none of the leased machinery has been used, the lessee shall notify the lessor in writing of that fact, on or before the fifth day of the next succeeding calendar month.

And that the following agreements, stipulations, and provisions are agreed to: —

Seven. If at any time the lessee shall fail or cease to use exclusively lasting machinery held by him under lease from the lessor for lasting all boots, shoes, and other footwear made by or for him which are lasted by the aid of machinery, the lessor, although it may have waived or ignored prior instances of such failure or cessation, may, at its option, terminate forthwith by notice in writing this lease and license and any other lease or license of lasting machines, lasting machinery or lasting devices then exisiting between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise; and the possession of and full right to and control of all lasting machines, lasting machinery or lasting devices held by the lessee under lease or license from the lessor or its assignors shall thereupon revest in the lessor free from all claims and demands whatsoever.

Eight. This lease and license shall continue, unless sooner ter-

minated by the lessor because of breach thereof on the part of the lessee, or otherwise as herein provided, for seventeen years from the date hereof. But if any breach or default shall be made in the observance of any one or more of the conditions herein contained or contained in any other lease or license agreement subsisting between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, and expressed to be obligatory upon the lessee, the lessor shall have the right, by notice in writing to the lessee, to terminate forthwith this lease and license, and also if the lessor so elects any other lease or license agreements then in force between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, and this notwithstanding that previous breaches or defaults may have been unnoticed, waived, or condoned by or on behalf of the lessor. If, upon the expiration of the full term of this lease, the lessor does not request the return of the leased machinery, then the leased machinery shall continue to be held and used under and in accordance with the conditions of this lease and license, which shall thereupon be extended indefinitely as to term; but thereafter either the lessee or the lessor, upon sixty days' notice in writing to the other, may terminate this lease and license, whereupon the leased machinery shall be delivered forthwith to the lessor, as herein provided. Upon the expiration or termination of this lease and license or any extension thereof by notice or by reason of any default on the part of the lessee as to the terms of this lease and license or any other lease or license from the lessor, or otherwise as herein provided, the lessee shall forthwith deliver the leased machinery to the lessor at its office or factory in good order, reasonable wear and tear alone excepted; and shall thereupon pay to the lessor the sum of One Hundred and Fifty ($150) dollars as compensation for setting up the leased machinery in his factory, for instructing operators, and for deterioration of the leased machinery; and the lessee, for himself, his heirs, executors and administrators, hereby grants to the lessor, its successors and assigns, full right, power and authority to enter upon the premises and into any factory, room, or any place where the leased machinery or any part thereof may be, and take posses-

sion thereof, and take away the same; and the lessee shall have no claim for the repayment of any sum or sums, or any part thereof, which he shall have paid as consideration for the grant of this lease and license or for rent or royalty, or otherwise in respect to the leased machinery.

Nine. A notice in writing, signed by the president, a vice-president, or the treasurer of the lessor, or by any assignee of the lessor's rights hereunder and posted by pre-paid letter, addressed to the lessee or delivered at his usual or last known place of abode or business, that the lease and license hereby granted is determined or shall be determined at the expiration of a certain period, shall be a sufficient determination of the lease and license from the time of posting or delivering such notice, or from the expiration of the period therein mentioned, as the case may be. Any termination of this lease and license shall not release the lessee from his obligation to pay rent or royalty for the period prior to such termination, and shall be without prejudice to any other rights or remedies which the lessor may have for violation of contract, use of machines without right, or use of patented inventions without license.

Ten. The lessee admits the validity of each and every of the Letters Patent of the United States of America, owned by the lessor or under which it is licensed, any of the inventions of which are or hereafter may be embodied in the leased machinery. The lessee also agrees that he will not directly or indirectly infringe or contest the validity of, or the title of the lessor to, any of the patents referred to in the "Schedule of Patents" hereto annexed. The termination or cessor of this lease and license from any cause whatever shall not in any way affect the provisions of this clause, or release or discharge the lessee from the admission and estoppel herein set forth.

Eleven. None of the terms or conditions of this lease and license shall be held to have been waived by any act or knowledge of the lessor, its agents or employees, but only by an instrument in writing, signed by the president, a vice-president, or the treasurer of the lessor.

Twelve. The term "lessor" shall include the said United Shoe

Machinery Company, and its successors and assigns. All the conditions and agreements binding on the lessee shall be binding on and enforceable against his legal representatives. In the construction of this instrument, words relating to the number and gender of the parties shall be read according to their real number and gender.

In witness whereof, the parties hereto have duly executed this instrument in duplicate, the day and year first above written.

Lease and License Number *2299*.

Consolidated Hand Method Machine.

This Lease and Agreement made at Boston, in the State of Massachusetts, this *thirty-first* day of *October*, 1900, between the United Shoe Machinery Company, a corporation organized under the laws of the State of New Jersey, having an office in said Boston, hereinafter referred to as the lessor, of the one part, and *New Ulm Boot and Shoe Company* of *New Ulm* in the State of *Minnesota*, hereinafter referred to as the lessee, of the other part:

Witnesseth, that the lessor in consideration of the covenants and agreements on the part of the lessee herein contained, does hereby lease to and license the lessee under its patents to use

Consolidated Hand Method Lasting Machine No. *3135*,

now or hereafter delivered to the lessee, and any duplicate parts, extras, mechanisms and devices relating thereto, or used in connection therewith, now attached to or delivered with the said designated machine, or which may at any time hereafter be obtained from the lessor, or be added thereto with the consent of the lessor (which machine, together with all duplicate parts, extras, mechanisms and devices, held by the lessee under these presents, whether now or hereafter delivered to or in the possession of the lessee, is hereinafter referred to as the "leased machinery"), subject to the conditions hereinafter contained.

And that the following are agreed to as conditions of the lease and license of the leased machinery, all of which the lessee covenants and agrees to keep and perform: —

One. The leased machinery shall at all times remain and be the sole and exclusive property of the lessor, and the lessee shall have no right of property therein but only the right to use the same, upon the conditions herein contained. The leased machinery shall be used only by the lessee himself, or by operatives in his direct employ, and only in the factory now occupied by him at *New Ulm*

in the State of *Minnesota*. The leased machinery shall not be transferred or delivered or sublet to any other person or corporation, and neither the lease nor the license hereby granted can be assigned by the lessee by his own act or by operation of law. If the lessee becomes insolvent or bankrupt, or has a receiving order made against him, or makes or executes any bill of sale, deed of trust or assignment for the benefit of his creditors, or if a sale or lease or removal of the leased machinery, or any part thereof, without the consent in writing of the lessor, be made or attempted, or if any distress or execution or attachment be levied thereon, then and in each such case this lease and license and any other lease or license then existing between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, shall at the option of the lessor cease and determine, and the possession of and full right to and control of all the leased machinery, and any machinery held by the lessee under any other lease or license from the lessor, whether as the result of assignment to the lessor or otherwise, shall thereupon revest in the lessor free from all claims or demands whatsoever. The lessor and its agents and employees shall at all times be given access to the leased machinery for the purpose of inspecting it or watching its use and operation, or of altering, repairing, improving, or adding to it, or determining the nature or extent of its use, and the lessee shall afford all reasonable facilities therefor.

Two. The lessee shall at all times and at his own expense keep the leased machinery in good and efficient working order and condition, and shall not permit anyone to injure or deface or remove any plate, or dates, numbers, or other inscriptions now or hereafter impressed on or affixed to the leased machinery by the lessor. The lessee shall obtain from the lessor exclusively, and shall pay therefor at the regular prices from time to time established by the lessor, all the duplicate parts, extras, mechanisms and devices of every kind needed or used in operating, repairing, or renewing the leased machinery, and the same shall form part of the leased machinery, and the lessee shall not otherwise make or allow to be made any addition, subtraction, or alteration to, from, or in the

leased machinery without the consent in writing of the lessor, nor interfere with the proper operation of the same.

Three. The lessee shall at his own expense insure the leased machinery against loss by fire, and keep the same insured to the amount of Two Hundred (200) Dollars, and in case the same is lost or destroyed by fire, or otherwise, before the expiration or termination of this lease, then the lessee shall pay to the lessor upon demand the sum of Two Hundred (200) Dollars as partial compensation for such loss or destruction. The lessee shall pay all taxes and assessments which shall be levied in respect to the leased machinery, or in respect to this lease and license, or the right to payments hereunder upon whomsoever assessed.

Four. The lessee shall use the leased machinery to its full capacity on all boots, shoes, and other footwear made in his factory in the manufacture of which it can be used, but the leased machinery shall not, nor shall any part thereof, be used in the manufacture of any boots, shoes, or other footwear which are or shall be welted, or the soles stitched on welt sewing or sole stitching machines not leased to the lessee by the lessor or its assignor, or in the manufacture of any turn boots, shoes, or other footwear, the soles of which are or shall be attached to their uppers by turn sewing machines not leased to the lessee by the lessor or its assignor, or in the manufacture of any boots, shoes, or other footwear which have been or shall be slugged, heel seat nailed, or otherwise partly made by the aid of any "Metallic" machinery not leased to the lessee by the lessor or its assignors.

Five. The Lessee shall pay to the Lessor on the last day of each calendar month as rent or royalty the sum of one (1) cent for each pair of misses' and children's and one and one quarter (1¼) cents for each pair of all other kinds of boots, shoes, or other footwear, or portions thereof, lasted or manufactured or prepared during the next preceding calendar month in any way, whether wholly or in part, by the aid of the leased machinery or any part thereof; **provided, however, that in all cases when the lessee shall pay to the lessor on or before the fifteenth day of the calendar month the rent or royalty due for the use of the leased machinery for the next pre-**

ceding calendar month, the lessor will in consideration of such prompt payment grant a discount of fifty per cent from such rent or royalty due for such preceding calendar month. The lessee guarantees that the rent or royalty herein provided (less all abatements) shall amount in each calendar year, ending December 31, to at least fifteen (15) dollars for each calendar month and at the end of each such calendar year the lessee shall pay to the lessor the amount, if any, by which the rent or royalty paid for said year is less than such guaranteed rent or royalty; provided, however, that if in any calendar year the factory of the lessee remains wholly idle for any entire calendar month, then the amount of rent or royalty guaranteed for that year shall be reduced by one twelfth for each such month that the factory thus remains wholly idle.

Six. The lessor may attach to the leased machinery, or any thereof, an indicator or indicators to register the number of revolutions or movements of any part or parts thereof, and the lessee shall not allow any person (other than the lessor or its agents) to disturb or interfere with such indicator or indicators. In case any indicator thus attached shall from any cause cease to correctly indicate or register, or shall be disturbed or out of repair, or if the glass covering any such indicator shall be removed or broken or injured, then, and as often as the same shall happen, the lessee shall immediately, by writing, notify the lessor, and at the same time explain the circumstances under which the same has happened. In case any such indicator ceases to indicate, or becomes or remains inaccurate, or the glass covering becomes or remains removed, broken, or injured, because of any fault of the lessee or anyone in his employ, or because of the failure of the lessee to give promptly the notice hereinbefore provided for, then, without prejudice to any other rights of the lessor hereunder, the lessee shall pay the lessor as rent or royalty, without the right to any discount, one and one quarter (1¼) cents per pair for each pair of boots, shoes, or other footwear, or portions thereof, in the manufacture of which the leased machinery or any part thereof shall have been used. The lessee shall keep full and accurate accounts, independently of any indicators that may be placed upon the leased machinery, show-

ing the number of boots, shoes, and other footwear, or portions thereof, in the manufacture of which the leased machinery or any part thereof shall have been used, and shall allow the lessor at all times, by its agents or attorneys, to examine and to take copies of such accounts and entries of the lessee as may serve to determine the total number of boots, shoes, or other footwear or portions thereof made by the aid of the leased machinery or any part thereof, and the lessee shall produce all such accounts and entries upon request. The lessee shall require each of his operators upon the leased machinery or any part thereof to keep upon blanks or blank books to be furnished by the lessor accurate daily records of the number of boots, shoes, and other footwear, or portions thereof, in the making of which he has used the leased machinery or any part thereof, and shall require his operators to sign such records, and if requested so to do by the lessor, shall verify the same under oath and shall also furnish any further information called for by said blanks or blank books; and the lessee shall send to the office of the lessor in Boston, on or before the fifth day of each calendar month the original records for the next preceding calendar month kept by his operators as above provided for; and in case, in any calendar month, none of the leased machinery has been used, the lessee shall notify the lessor in writing of that fact, on or before the fifth day of the next succeeding calendar month.

And that the following agreements, stipulations, and provisions are agreed to: —

Seven. If at any time the lessee shall fail or cease to use exclusively lasting machinery held by him under lease from the lessor for lasting all boots, shoes, and other footwear made by or for him which are lasted by the aid of machinery, the lessor, although it may have waived or ignored prior instances of such failure or cessation, may, at its option, terminate forthwith by notice in writing this lease and license and any other lease or license of "Lasting Machine Department" machinery then existing between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise; and the possession of and full right to and control of all the leased machinery, and all "Lasting Machine Department"

machinery held by the lessee under any other lease or license from the lessor or its assignors shall thereupon revest in the lessor free from all claims and demands whatsoever.

Eight. This lease and license shall continue, unless sooner terminated by the lessor because of breach thereof on the part of the lessee, or otherwise as herein provided, for seventeen years from the date hereof. But if any breach or default shall be made in the observance of any one or more of the conditions herein contained or contained in any other lease or license agreement subsisting between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, and expressed to be obligatory upon the lessee, the lessor shall have the right, by notice in writing to the lessee, to terminate forthwith this lease and license, and also if the lessor so elects any other lease or license agreements then in force between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, and this notwithstanding that previous breaches or defaults may have been unnoticed, waived or condoned by or on behalf of the lessor. If, upon the expiration of the full term of this lease, the lessor does not request the return of the leased machinery, then the leased machinery shall continue to be held and used under and in accordance with the conditions of this lease and license, which shall thereupon be extended indefinitely as to term; but thereafter either the lessee or the lessor, upon sixty days' notice in writing to the other, may terminate this lease and license, whereupon the leased machinery shall be delivered forthwith to the lessor, as herein provided. Upon the expiration or termination of this lease and license or any extension thereof by notice or by reason of any default on the part of the lessee as to the terms of this lease and license or any other lease or license from the lessor, or otherwise as herein provided, the lessee shall forthwith deliver the leased machinery to the lessor at its office or factory in good order, reasonable wear and tear alone excepted: and shall thereupon pay to the lessor the sum of One Hundred and Fifty (150) dollars as compensation for setting up the leased machinery in his factory, for instructing operators, and for deterioration of the leased machinery; and the lessee, for himself, his heirs,

executors and administrators, hereby grants to the lessor, its successors and assigns, full right, power, and authority to enter upon the premises and into any factory, room, or any place where the leased machinery or any part thereof may be, and take possession thereof, and take away the same; and the lessee shall have no claim for the repayment of any sum or sums, or any part thereof, which he shall have paid as consideration for the grant of this lease and license or for rent or royalty, or otherwise in respect to the leased machinery.

Nine. A notice in writing, signed by the president, a vice-president, or the treasurer of the lessor, or by any assignee of the lessor's rights hereunder and posted by pre-paid letter, addressed to the lessee or delivered at his usual or last known place of abode or business, that the lease and license hereby granted is determined or shall be determined at the expiration of a certain period, shall be a sufficient determination of the lease and license from the time of posting or delivering such notice, or from the expiration of the period therein mentioned, as the case may be. Any termination of this lease and license shall not release the lessee from his obligation to pay rent or royalty for the period prior to such termination, and shall be without prejudice to any other rights or remedies which the lessor may have for violation of contract, use of machines without right, or use of patented inventions without license.

Ten. The lessee admits the validity of each and every of the Letters Patent of the United States of America owned by the lessor or under which it is licensed, any of the inventions of which are or hereafter may be embodied in the leased machinery. The lessee also agrees that he will not directly or indirectly infringe or contest the validity of, or the title of the lessor to, any of the patents referred to in the "Schedule of Patents" hereto annexed, and that he shall be forever estopped from so doing. The termination or cessor of this lease and license from any cause whatever shall not in any way affect the provisions of this clause, or release or discharge the lessee from the admission and estoppel herein set forth.

Eleven. None of the terms or conditions of this lease and license shall be held to have been waived by any act or knowledge of the

lessor, its agents or employees, but only by an instrument in writing, signed by the president, a vice-president, or the treasurer of the lessor.

Twelve. The term "lessor" shall include the said United Shoe Machinery Company, and its successors and assigns. All the conditions and agreements binding on the lessee shall be binding on and enforceable against his legal representatives. In the construction of this instrument, words relating to the number and gender of the parties shall be read according to their real number and gender.

In witness whereof, the parties hereto have duly executed this instrument in duplicate, the day and year first above written.

Lease and License Number .

Consolidated Hand Method Lasting Machine.

This Lease and Agreement made at Boston, in the State of Massachusetts, this day of 19 , between the United Shoe Machinery Company, a corporation organized under the laws of the State of New Jersey, having an office in said Boston, hereinafter referred to as the lessor, of the one part, and of in the State of , hereinafter referred to as the lessee, of the other part:

Witnesseth, that the lessor, in consideration of the covenants and agreements on the part of the lessee herein contained, does hereby lease to and license the lessee under any letters patent belonging to the lessor or under which the lessor has the right to grant such license affecting any inventions which are now or hereafter shall be embodied therein or employed in the operation thereof, to use

Consolidated Hand Method Lasting Machine, No. ,

now or hereafter delivered to the lessee and any duplicate parts, extras, mechanisms and devices relating thereto, or used in connection therewith, now attached to or delivered with the said designated machine, or which may at any time hereafter be obtained from the lessor, or be added thereto by or with the consent of the lessor (which machine, together with all duplicate parts, extras, mechanisms and devices, held by the lessee under these presents, whether now or hereafter delivered to or in the possession of the lessee, is hereinafter referred to as the "leased machinery"), subject to the conditions hereinafter contained.

And that the following are agreed to as conditions of the lease and license of the leased machinery, all of which the lessee covenants and agrees to keep and perform: —

One. The leased machinery shall at all times remain and be the sole and exclusive property of the lessor, and the lessee shall have no right of property therein, but only the right to use the same, upon the conditions herein contained. The leased machinery shall be used only by the lessee himself or by operatives in his direct employ, and only in the factory now occupied by him at in the State of . The leased machinery shall not be transferred or delivered or sublet to any other person or corporation, and neither the lease nor the license hereby granted can be assigned by the lessee by his own act or by operation of law. If the lessee becomes insolvent or bankrupt, or has a receiving order made against him, or makes or executes any bill of sale, deed of trust or assignment for the benefit of his creditors, or if a sale, mortgage, lease or removal of the leased machinery, or any part thereof, be made or attempted, or if any distress or execution or attachment be levied thereon, then and in each such case this lease and license and any other lease or license then existing between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, shall at the option of the lessor cease and determine, and the possession of and full right to and control of all the leased machinery, and any machinery held by the lessee under any other lease or license from the lessor, whether as the result of assignment to the lessor or otherwise, shall thereupon revest in the lessor free from all claims or demands whatsoever. The lessor and its agents and employees shall at all times be given access to the leased machinery for the purpose of inspecting it or watching its use and operation, or of altering, repairing, improving, or adding to it, or determining the nature or extent of its use, and the lessee shall afford all reasonable facilities therefor.

Two. The lessee shall at all times and at his own expense keep the leased machinery in good and efficient working order and condition, and shall not permit any one to injure or deface or remove any plate, or dates, numbers, or other inscriptions now or hereafter

impressed on or affixed to the leased machinery by the lessor. The lessee shall obtain from the lessor exclusively, and shall pay therefor at the regular prices from time to time established by the lessor, all the duplicate parts, extras, mechanisms and devices of every kind needed or used in operating, repairing, or renewing the leased machinery, and the same shall form part of the leased machinery, and the lessee shall not otherwise make or allow to be made any addition, subtraction or alteration to, from, or in the leased machinery without the consent in writing of the lessor, nor interfere with the proper operation of the same.

Three. The lessee shall pay all taxes and assessments which shall be assessed in respect to the leased machinery or other machinery of the lessor held by the lessee under lease or license upon whomsoever assessed. All taxes or assessments in respect to leases, licenses or agreements covering machinery, or the rights to payments thereunder, shall be construed, for the purposes of this article, to be assessed in respect to the machinery itself. In case at any time any unapportioned tax or assessment shall be assessed to the lessor in respect in part but not wholly to machinery of the lessor in possession of the lessee the lessee shall pay to the lessor such proportionate part of the total amount of said unapportioned tax or assessment as the fair valuation, to be determined by the lessor, of said machinery of the lessor in the possession of the lessee bears to the fair valuation, to be determined by the lessor, of all machinery (excepting machinery, if any, in the lessor's own possession) in respect to which the unapportioned tax or assessment has been assessed; provided, however, that if such unapportioned tax or assessment includes any tax or assessment in respect to tangible property in the lessor's own possession the amount thereof, based, at the established rate, upon the fair valuation, to be determined by the lessor, of such property, shall first be deducted and the lessee shall pay his proportionate part as aforesaid of the balance only of said unapportioned tax or assessment after such deduction has been made.

Four. The lessee shall use the leased machinery to its full capa-

city on all boots, shoes and other footwear made in his factory in the manufacture of which it can be used.

Five. The lessee shall pay to the lessor immediately after the execution hereof as a lease premium the sum of dollars, and the lessee shall also pay to the lessor on the last day of each calendar month as rent or royalty the sum of one (1) cent for each pair of misses' and children's and one and one-quarter (1¼) cents for each pair of all other kinds of boots, shoes or other footwear, or portions thereof, lasted or manufactured or prepared during the next preceding calendar month in any way, whether wholly or in part, by the aid of the leased machinery or any part thereof; **provided, however, that in all cases when the lessee shall pay to the lessor on or before the fifteenth day of the calendar month the rent or royalty due for the use of the leased machinery for the next preceding calendar month the lessor will, in consideration of such prompt payment grant a discount of fifty per cent. from such rent or royalty due for such preceding calendar month.** If, for any cause, the leased machinery shall not be in use for twelve (12) consecutive months to the extent of its earning for the lessor at the rental and royalty herein provided to be paid (less all abatements) an amount equal to or in excess of seventy-five dollars ($75), then the lessor may, by paying to the lessee a sum equal to one-third (⅓) of the sum paid by him as the lease premium hereunder, cancel and terminate this lease and license, and this option and condition shall be independent of any other options and conditions in this lease and license contained.

Six. The lessor may attach to the leased machinery, or any thereof, an indicator or indicators to register the number of revolutions or movements of any part or parts thereof, and the lessee shall not allow any person (other than the lessor or its agents) to disturb or interfere with such indicator or indicators. In case any indicator thus attached shall from any cause cease to correctly indicate or register, or shall be disturbed or out of repair, or if the glass covering any such indicator shall be removed or broken or injured, then and as often as the same shall happen the lessee shall immediately by writing notify the lessor and at the same time

explain the circumstances under which the same has happened. In case any such indicator ceases to indicate, or becomes or remains inaccurate, or the glass covering becomes or remains removed, broken, or injured, because of any fault of the lessee or anyone in his employ, or because of the failure of the lessee to give promptly the notice hereinbefore provided for, then, without prejudice to any other rights of the lessor hereunder, the lessee shall pay the lessor as rent or royalty, without the right to any discount, one and one-quarter (1¼) cents per pair for each pair of boots, shoes or other footwear, or portions thereof, in the manufacture of which the leased machinery or any part thereof shall have been used. The lessee shall keep full and accurate accounts, independently of any indicators that may be placed upon the leased machinery, showing the number of each kind of boots, shoes and other footwear, or portions thereof, in the manufacture of which the leased machinery or any part thereof shall have been used, and shall allow the lessor at all times, by its agents or attorneys, to examine and to take copies of such accounts and entries of the lessee as may serve to determine the total number of boots, shoes or other footwear, or portions thereof made by the aid of leased machinery or any part thereof and the lessee shall produce all such accounts and entries upon request. The lessee shall require each of his operators upon the leased machinery or any part thereof to keep upon blanks or blank books to be furnished by the lessor accurate daily records of the number of each kind of boots, shoes and other footwear, or portions thereof, in the making of which he has used the leased machinery or any part thereof, and shall require his operators to sign such records, and, if requested so to do by the lessor, shall verify the same under oath. The lessee shall send to the office of the lessor in Boston, on or before the fifth day of each calendar month, the original records for the next preceding calendar month kept by his operators as above provided for; and in case, in any calendar month, none of the leased machinery has been used, the lessee shall notify the lessor in writing of that fact, on or before the fifth day of the next succeeding calendar month. The lessee

shall also furnish any further information which may be called for in relation to the leased machinery or the use thereof.

And that the following agreements, stipulations and provisions are agreed to: —

Seven. If at any time the lessee shall fail or cease to use exclusively lasting machinery held by him under lease from the lessor for lasting all boots, shoes, and other footwear made by or for him, which are lasted by the aid of machinery, or shall fail or cease to use exclusively lasting and tacking mechanisms and appliances held by him under lease from the lessor for doing all work in the manufacture of all boots, shoes, and other footwear made by or for him which is done by the aid of lasting and tacking mechanisms and appliances, the lessor, although it may have waived or ignored prior instances of such failure or cessation, may at its option terminate forthwith by notice in writing any or all leases of or licenses to use lasting machines, lasting machinery, and lasting and tacking mechanisms and appliances then existing between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise; and the possession of and full right to and control of all the leased machinery and all lasting machines, lasting machinery, and lasting and tacking mechanisms and appliances held by the lessee under lease or license from the lessor or its assignors shall thereupon revest in the lessor free from all claims and demands whatsoever.

Eight. This lease and license shall continue, unless sooner terminated by the lessor because of breach thereof on the part of the lessee, or otherwise as herein provided, for seventeen years from the date hereof. But if any breach or default shall be made in the observance of any one or more of the conditions herein contained or contained in any other lease or license agreement subsisting between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise and expressed to be obligatory upon the lessee, the lessor shall have the right by notice in writing to the lessee to terminate forthwith this lease and license, and also, if the lessor so elects, any other lease or license agreements then in force between the lessor and the lessee, whether as the result of

assignment to the lessor or otherwise, and this notwithstanding that previous breaches or defaults may have been unnoticed, waived, or condoned by or on behalf of the lessor. If, upon the expiration of the full term of this lease, the lessor does not request the return of the leased machinery, then the leased machinery shall continue to be held and used under and in accordance with the conditions of this lease and license, which shall thereupon be extended indefinitely as to term; but thereafter either the lessee or the lessor, upon sixty days' notice in writing to the other, may terminate this lease and license, whereupon the leased machinery shall be delivered forthwith to the lessor, as herein provided. Upon the expiration of this lease and license or any extension thereof or its termination by notice or by reason of any default on the part of the lessee as to the terms of this lease and license or any other lease or license from the lessor, or otherwise in any manner whatsoever, the lessee shall forthwith deliver the leased machinery to the lessor at Beverly, Massachusetts, in good order, reasonable wear and tear alone excepted; and the lessee for himself, his heirs, executors, and administrators, hereby grants to the lessor, its successors and assigns, full right, power and authority to enter upon the premises and into any factory, room, or any place where the leased machinery, or any part thereof, may be, and take possession thereof, and take away the same; and in no case (excepting, as hereinbefore provided, in the event of termination by the lessor under the option reserved in Article Five hereof, for failure to use to the amount therein specified, and for no other reason) shall the lessee have any claim for the repayment of any sum or sums or any part thereof which he shall have paid as consideration for the grant of this lease and license or for rent or royalty or otherwise in respect to the leased machinery.

Nine. A notice in writing, signed by the president, a vice-president, the treasurer or the assistant treasurer of the lessor, or by any assignee of the lessor's rights hereunder, and posted by prepaid letter, addressed to the lessee or delivered at his usual or last known place of abode or business, that the lease and license hereby

granted is determined or shall be determined at the expiration of a certain period, shall be a sufficient determination of the lease and license from the time of posting or delivering such notice, or from the expiration of the period therein mentioned, as the case may be. Any termination of this lease and license shall not release the lessee from his obligation to pay rent or royalty for the period prior to such termination, and shall be without prejudice to any other rights or remedies which the lessor may have for violation of contract, use of machines without right, or use of patented inventions without license.

Ten. The lessee admits the validity for the full term expressed in the grant thereof (and every extension and renewal thereof) of each and every of the Letters Patent of the United States of America, owned by the lessor or under which it is licensed, any of the inventions of which are or hereafter may be embodied in the leased machinery. The lessee also agrees that he will not directly or indirectly infringe or contest the validity for the full term expressed in the grant thereof or of any extension or renewal thereof, of any of the Letters Patent referred to in the "Schedule of Patents" hereto annexed or the title of the lessor thereto. The expiration of this agreement or any extension thereof or the termination or cesser of the lease and license hereby granted shall not in any way affect the provisions of this clause, or release or discharge the lessee from the admissions and estoppels herein set forth.

Eleven. None of the terms or conditions of this lease and license shall be held to have been waived by any act or knowledge of the lessor, its agents or employees, but only by an instrument in writing, signed by the president, a vice-president or the treasurer of the lessor.

Twelve. The term "lessor" shall include the said United Shoe Machinery Company and its successors and assigns. All the conditions and agreements binding on the lessee shall be binding on and enforceable against his legal representatives. In the construction of this instrument, words relating to the number and gender of the parties shall be read according to their real number and gender.

In witness whereof, the parties hereto have duly executed this instrument in duplicate, the day and year first above written.

Lease and License Number *303*.

Ideal Lasting Machine.

This Lease and Agreement made at Boston in the State of Massachusetts this *twenty-sixth* day of *September*, 19*01*, between the United Shoe Machinery Company, a corporation organized under the laws of the State of New Jersey, having an office in said Boston, hereinafter referred to as the lessor, of the one part, and *Hanan and Son* of *Brooklyn* in the State of *New York*, hereinafter referred to as the lessee, of the other part:

Witnesseth, that the lessor, in consideration of the covenants and agreements on the part of the lessee herein contained, does hereby lease to and license the lessee under its patents to use the machine or machines of the Lasting Machine Department of the lessor now or hereafter delivered to the lessee, and designated by number in the following schedule, viz: —

SCHEDULE OF MACHINES.

Ideal Lasting Machine, No. *389*.
Rapid Lasting Machine (Foot Power), No. .
Rapid Power Lasting Machine, No. .
Rapid Loose Tacker (with Hopper and Loader), No. *332 333*.

and any duplicate parts, extras, mechanisms and devices relating thereto, or used in connection therewith, now attached to or delivered with the said designated machine or machines or which may at any time hereafter be obtained from the lessor, or be added thereto with the consent of the lessor (the whole of which machine or machines together with all duplicate parts, extras, mechanisms and devices, held by the lessee under these presents, whether now or hereafter delivered to or in the possession of the lessee, is hereinafter referred to as the "leased machinery"), subject to the conditions hereinafter contained.

And that the following are agreed to as conditions of the lease

and license of the leased machinery, all of which the lessee covenants and agrees to keep and perform: —

One. The leased machinery shall at all times remain and be the sole and exclusive property of the lessor, and the lessee shall have no right of property therein but only the right to use the same, upon the conditions herein contained. The leased machinery shall be used only by the lessee himself, or by operatives in his direct employ, and only in the factory now occupied by him at *Brooklyn* in the State of *New York*. The leased machinery shall not be transferred or delivered or sublet to any other person or corporation, and neither the lease nor the license hereby granted can be assigned by the lessee by his own act or by operation of law. If the lessee becomes insolvent or bankrupt, or has a receiving order made against him, or makes or executes any bill of sale, deed of trust or assignment for the benefit of his creditors, or if a sale or lease or removal of the leased machinery, or any part thereof, without the consent in writing of the lessor, be made or attempted, or if any distress or execution or attachment be levied thereon, then and in each such case this lease and license and any other lease or license then existing between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, shall at the option of the lessor cease and determine, and the possession of and full right to and control of all the leased machinery, and any machinery held by the lessee under any other lease or license from the lessor, whether as the result of assignment to the lessor or otherwise, shall at the option of the lessor cease and determine, and the possession of and full right to and control of all the leased machinery, and any machinery held by the lessee under any other lease or license from the lessor, whether as the result of assignment to the lessor or otherwise, shall thereupon revest in the lessor free from all claims or demands whatsoever. The lessor and its agents and employees shall at all times be given access to the leased machinery for the purpose of inspecting it or watching its use and operation, or of altering, repairing, improving, or adding to it, or determining the nature or extent of its use, and the lessee shall afford all reasonable facilities therefor.

Two. The lessee shall at all times and at his own expense keep the leased machinery in good and efficient working order and condition, and shall not permit anyone to injure or deface or remove any plate, or dates, numbers, or other inscriptions now or hereafter impressed on or affixed to the leased machinery by the lessor. The lessee shall obtain from the lessor exclusively, and shall pay therefor at the regular prices from time to time established by the lessor, all the duplicate parts, extras, mechanisms and devices of every kind needed or used in operating, repairing or renewing the leased machinery, and the same shall form part of the leased machinery, and the lessee shall not otherwise make or allow to be made any addition, subtraction, or alteration to, from, or in the leased machinery without the consent in writing of the lessor, nor interfere with the proper operation of the same.

Three. The lessee shall pay all taxes and assessments which shall be levied in respect to the leased machinery, or in respect to this lease and license, or the right to payments hereunder upon whomsoever assessed.

Four. The lessee shall use the leased machinery to its full capacity on all boots, shoes, and other footwear made in his factory in the manufacture of which it can be used, but the leased machinery shall not nor shall any part thereof be used in the manufacture of any boots, shoes, or other footwear which are or shall be welted or the soles stitched on welt sewing or sole stitching machines not leased to the lessee by the lessor or its assignor or in the manufacture of any turn boots, shoes, or other footwear, the soles of which are or shall be attached to their uppers by turn sewing machines not leased to the lessee by the lessor or its assignor.

Five. The lessee shall pay to the lessor immediately after the execution hereof as a lease premium the sum of three hundred dollars, and the lessee shall also pay to the lessor on the last day of each calendar month as rent or royalty the sum of one (1) cent for each pair of boots, shoes, or other footwear, or portions thereof, lasted or manfactured or prepared during the next preceding calendar month in any way, whether wholly or in part, by the aid of the leased machinery or any part thereof; **provided, however, that in**

all cases when the lessee shall pay to the lessor on or before the fifteenth day of the calendar month the rent or royalty due for the use of the leased machinery for the next preceding calendar month, the lessor will in consideration of such prompt payment grant a discount of fifty per cent. from such rent or royalty due for such preceding calendar month. If, for any cause, the leased machinery shall not be in use for twelve (12) consecutive months to the extent of its earning for the lessor at the rental and royalty herein provided to be paid (less all abatements) an amount equal to or in excess of seventy-five dollars ($75) then the lessor may, by paying to the lessee a sum equal to one-third (⅓) of the sum paid by him as the lease premium hereunder, cancel and terminate this lease and license, and this option and condition shall be independent of any other options and conditions in this lease and license contained.

Six. The lessor may attach to the leased machinery, or any thereof, an indicator or indicators to register the number of revolutions or movements of any part or parts thereof, and the lessee shall not allow any person (other than the lessor or its agents) to disturb or interfere with such indicator or indicators. In case any indicator thus attached shall from any cause cease to correctly indicate or register, or shall be disturbed or out of repair, or if the glass covering any such indicator shall be removed or broken or injured, then, and as often as the same shall happen, the lessee shall immediately, by writing, notify the lessor, and at the same time explain the circumstances under which the same has happened. In case any such indicator ceases to indicate, or becomes or remains inaccurate, or the glass covering becomes or remains removed, broken, or injured, because of any fault of the lessee or any one in his employ, or because of the failure of the lessee to give promptly the notice hereinbefore provided for, then, without prejudice to any other rights of the lessor hereunder, the lessee shall pay the lessor as rent or royalty, without the right to any discount, the sum of one cent per pair for each pair of boots, shoes, or other footwear, or portions thereof, in the manufacture of which the leased machinery or any part thereof shall have been used. The

lessee shall keep full and accurate accounts, independently of any indicators that may be placed upon the leased machinery, showing the number of boots, shoes, and other footwear, or portions thereof, in the manufacture of which the leased machinery or any part thereof shall have been used, and shall allow the lessor at all times, by its agents or attorneys, to examine and to take copies of such accounts and entries of the lessee as may serve to determine the total number of boots, shoes, or other footwear or portions thereof made by the aid of the leased machinery or any part thereof, and the lessee shall produce all such accounts and entries upon request. The lessee shall require each of his operators upon the leased machinery or any part thereof to keep upon blanks or blank books to be furnished by the lessor accurate daily records of the number of boots, shoes, and other footwear, or portions thereof, in the making of which he has used the leased machinery or any part thereof, and shall require his operators to sign such records, and, if requested so to do by the lessor, shall verify the same under oath. The lessee shall send to the office of the lessor in Boston, on or before the fifth day of each calendar month, the original records for the next preceding calendar month kept by his operators as above provided for; and in case, in any calendar month, none of the leased machinery has been used, the lessee shall notify the lessor in writing of that fact, on or before the fifth day of the next succeeding calendar month. The lessee shall also furnish any further information which may be called for in relation to the leased machinery or the use thereof.

And that the following agreements, stipulations, and provisions are agreed to: —

Seven. If at any time the lessee shall fail or cease to use exclusively lasting machinery held by him under lease from the lessor for lasting all boots, shoes, and other footwear made by or for him, which are lasted by the aid of machinery, or shall fail or cease to use exclusively tacking mechanisms and appliances held by him under lease from the lessor, for doing all work in the manufacture of all boots, shoes, and other footwear made by or for him which is done by the aid of tacking mechanisms and appliances, the lessor,

although it may have waived or ignored prior instances of such failure or cessation, may at its option terminate forthwith by notice in writing this lease and license and any other lease or license of lasting machines, lasting machinery, lasting mechanisms, or lasting devices then existing between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise; and the possession of and full right to and control of all the leased machinery and all lasting machines, lasting machinery, lasting mechanisms, and lasting devices held by the lessee under lease or license from the lessor or its assignors shall thereupon revest in the lessor free from all claims and demands whatsoever.

Eight. This lease and license shall continue, unless sooner terminated by the lessor because of breach thereof on the part of the lessee, or otherwise as herein provided, for seventeen years from the date hereof. But if any breach or default shall be made in the observance of any one or more of the conditions herein contained or contained in any other lease or license agreement subsisting between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, and expressed to be obligatory upon the lessee, the lessor shall have the right, by notice in writing to the lessee, to terminate forthwith this lease and license, and also if the lessor so elects any other lease or license agreements then in force between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, and this notwithstanding that previous breaches or defaults may have been unnoticed, waived, or condoned by or on behalf of the lessor. If, upon the expiration of the full term of this lease, the lessor does not request the return of the leased machinery, then the leased machinery shall continue to be held and used under and in accordance with the conditions of this lease and license, which shall thereupon be extended indefinitely as to term; but thereafter either the lessee or the lessor, upon sixty days' notice in writing to the other, may terminate this lease and license, whereupon the leased machinery shall be delivered forthwith to the lessor, as herein provided. Upon the expiration or termination of this lease and license or any extension thereof by notice or by reason of any default on the part

of the lessee as to the terms of this lease and license or any other lease or license from the lessor, or otherwise as herein provided, the lessee shall forthwith deliver the leased machinery to the lessor at its office or factory in good order, reasonable wear and tear alone excepted; and the lessee, for himself, his heirs, executors and administrators, hereby grants to the lessor, its successors and assigns, full right, power, and authority to enter upon the premises and into any factory, room, or any place where the leased machinery or any part thereof may be, and take possession thereof, and take away the same; and the lessee shall have no claim for the repayment of any sum or sums, or any part thereof, which he shall have paid as consideration for the grant of this lease and license or for rent or royalty, or otherwise in respect to the leased machinery.

Nine. A notice in writing, signed by the president, a vice-presi- or the treasurer of the lessor, or by any assignee of the lessor's rights hereunder, and posted by prepaid letter, addressed to the lessee or delivered at his usual or last known place of abode or business, that the lease and license hereby granted is determined or shall be determined at the expiration of a certain period, shall be a sufficient determination of the lease and license from the time of posting or delivering such notice, or from the expiration of the period therein mentioned, as the case may be. Any termination of this lease and license shall not release the lessee from his obligation to pay rent or royalty for the period prior to such termination, and shall be without prejudice to any other rights or remedies which the lessor may have for violation of contract, use of machines without right, or use of patented inventions without license.

Ten. The lessee admits the validity of each and every of the Letters Patent of the United States of America, owned by the lessor or under which it is licensed, any of the inventions of which are or hereafter may be embodied in the leased machinery. The lessee also agrees that he will not directly or indirectly infringe or contest the validity of, or the title of the lessor to, any of the patents referred to in the "Schedule of Patents" hereto annexed. The termination or cessor of this lease and license from any cause whatever shall not in any way affect the provisions of this clause,

or release or discharge the lessee from the admission and estoppel herein set forth.

Eleven. None of the terms or conditions of this lease and license shall be held to have been waived by any act or knowledge of the lessor, its agents or employees, but only by an instrument in writing, signed by the president, a vice-president, or the treasurer of the lessor.

Twelve. The term "lessor" shall include the said United Shoe Machinery Company and its successors and assigns. All the conditions and agreements binding on the lessee shall be binding on and enforceable against his legal representatives. In the construction of this instrument, words relating to the number and gender of the parties shall be read according to their real number and gender.

In witness whereof, the parties hereto have duly executed this instrument in duplicate, the day and year first above written.

Lasting Machine Department. [Form 601.]

Lease and License Number *2*

Chase Lasting Machine.

This Lease and Agreement made at Boston in the State of Massachusetts this *sixteenth* day of *July* 1901, between the United Shoe Machinery Company, a corporation organized under the laws of the State of New Jersey, having an office in said Boston, hereinafter referred to as the lessor, of the one part, and *Fitzpatrick Shoe Company* of *Stoughton* in the State of *Massachusetts*, hereinafter referred to as the lessee, of the other part:

Witnesseth, that the lessor, in consideration of the covenants and agreements on the part of the lessee herein contained, does hereby lease to and license the lessee under its patents to use the machine or machines of the Lasting Machine Department of the lessor now or hereafter delivered to the lessee, and designated by number as follows, viz.: —

Chase Lasting Machine No. *124, 235*

Chase Hand Tacker (Stop Motion) No. *1545, 2274*

and any duplicate parts, extras, mechanisms and devices relating thereto, or used in connection therewith, now attached to or delivered with the said designated machine or machines, or which may at any time hereafter be obtained from the lessor, or be added thereto with the consent of the lessor (the whole of which machine or machines, duplicate parts, extras, mechanisms and devices, held by the lessee under these presents, whether now or hereafter deliv-

ered to or in the possession of the lessee, is hereinafter referred to as the "leased machinery"), subject to the conditions hereinafter contained.

And that the following are agreed to as conditions of the lease and license of the leased machinery, all of which the lessee covenants and agrees to keep and perform: —

One. The leased machinery shall at all times remain and be the sole and exclusive property of the lessor, and the lessee shall have no right of property therein, but only the right to use the same, upon the conditions herein contained. The leased machinery shall be used only by the lessee himself or by operatives in his direct employ, and only in the factory now occupied by him at *Stoughton* in the State of *Massachusetts*. The leased machinery shall not be transferred or delivered or sublet to any other person or corporation, and neither the lease nor the license hereby granted can be assigned by the lessee by his own act or by operation of law. If the lessee becomes insolvent or bankrupt, or has a receiving order made against him, or makes or executes any bill of sale, deed of trust or assignment for the benefit of his creditors or if a sale or lease or removal of the leased machinery, or any part thereof, without the consent in writing of the lessor, be made or attempted, or if any distress or execution or attachment be levied thereon, then and in each such case this lease and license and any other lease or license then existing between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, shall at the option of the lessor cease and determine, and the possession of and full right to and control of all the leased machinery, and any machinery held by the lessee under any other lease or license from the lessor, whether as the result of assignment to the lessor or otherwise, shall thereupon revest in the lessor free from all claims or demands whatsoever. The lessor and its agents and employees shall at all times be given access to the leased machinery for the purpose of inspecting it or watching its use and operation, or of altering, repairing, improving or adding to it, or determining the nature or extent of its use, and the lessee shall afford all reasonable facilities therefor.

Two. The lessee shall at all times and at his own expense keep the leased machinery in good and efficient working order and condition, and shall not permit anyone to injure or deface or remove any plate, or dates, numbers, or other inscriptions now or hereafter impressed on or affixed to the leased machinery by the lessor. The lessee shall obtain from the lessor exclusively, and shall pay therefor at the regular prices from time to time established by the lessor, all the duplicate parts, extras, mechanisms and devices of every kind needed or used in operating, repairing, or renewing the leased machinery, and the same shall form part of the leased machinery, and the lessee shall not otherwise make or allow to be made any addition, subtraction or alteration to, from, or in the leased machinery without the consent in writing of the lessor, nor interfere with the proper operation of the same. The lessee shall also purchase from the lessor exclusively at the prices from time to time established by the lessor all supplies, including string nail, tack strips, and other fastening material used in connection with the leased machinery.

Three. The lessee shall at his own expense insure the leased machinery against loss by fire, and keep the same insured to the amount of Two Hundred (200) Dollars for each Chase Lasting Machine hereby leased and in case the same is lost or destroyed by fire, or otherwise, before the expiration or termination of this lease, then the lessee shall pay to the lessor upon demand the sum of Two Hundred (200) Dollars for each such Chase Lasting Machine and accessories as partial compensation for such loss or destruction. The lessee shall pay all taxes and assessments which shall be levied in respect to the leased machinery or in respect to this lease and license or the right to payments hereunder, upon whomsoever assessed.

Four. The lessee shall use the leased machinery to its full capacity on all boots, shoes, and other footwear made in his factory in the manufacture of which it can be used, but the leased machinery shall not nor shall any part thereof be used in the manufacture of any boots, shoes, or other footwear which are or shall be welted or the soles stitched on welt sewing or sole stitching machines not

leased to the lessee by the lessor or its assignor or in the manufacture of any turned boots, shoes, or other footwear, the soles of which are or shall be attached to their uppers by turn sewing machines not leased to the lessee by the lessor or its assignor, or in the manufacture of any boots, shoes, or other footwear which have been or shall be slugged, heel seat nailed, or otherwise partly made by the aid of any "Metallic" machinery not leased to the lessee by the lessor or its assignors.

Five. The lessee shall pay to the lessor on the last day of each calendar month as rent or royalty the sum of one and one half (1½) cents for each pair of long-legged boots and of one (1) cent for each pair of all other kinds of boots, shoes, or other footwear, or portions thereof, lasted or manufactured or prepared during the next preceding calendar month in any way, whether wholly or in part, by the aid of the leased machinery or any part thereof; **provided, however, that in all cases when the lessee shall pay to the lessor on or before the fifteenth day of the calendar month the rent or royalty due for the use of the leased machinery for the next preceding calendar month, the lessor will in consideration of such prompt payment grant a discount of fifty per cent. from such rent or royalty due for such preceding calendar month.** The lessee guarantees that the rent or royalty herein provided (less all abatements) shall amount in each calendar year, ending December 31, to at least ten (10) dollars for each calendar month and at the end of each such calendar year the lessee shall pay to the lessor the amount, if any, by which the rent or royalty paid for said year is less than such guaranteed rent or royalty; provided, however, that if in any calendar year the factory of the lessee remains wholly idle for any entire calendar month, then the amount of rent or royalty guaranteed for that year shall be reduced by one-twelfth for each such month that the factory thus remains wholly idle.

Six. The lessor may attach to the leased machinery, or any thereof, an indicator or indicators to register the number of revolutions or movements of any part or parts thereof, and the lessee shall not allow any person (other than the lessor or its agents) to

disturb or interfere with such indicator or indicators. In case any indicator thus attached shall from any cause cease to correctly indicate or register, or shall be disturbed or out of repair, or if the glass covering any such indicator shall be removed or broken or injured, then and as often as the same shall happen the lessee shall immediately by writing notify the lessor and at the same time explain the circumstances under which the same has happened. In case any such indicator ceases to indicate or becomes or remains inaccurate or the glass covering becomes or remains removed, broken, or injured because of any fault of the lessee or any one in his employ, or because of the failure of the lessee to give promptly the notice hereinbefore provided for, then, without prejudice to any other rights of the lessor hereunder, the lessee shall pay the lessor as rent or royalty, without the right to any discount, one and one-half (1½) cents per pair for each pair of boots, shoes, or other footwear, or portions thereof, in the manufacture of which the leased machinery, or any part thereof, shall have been used. The lessee shall keep full and accurate accounts, independently of any indicators that may be placed upon the leased machinery, showing the number of each kind of boots, shoes, and other footwear, or portions thereof, in the manufacture of which the leased machinery, or any part thereof, shall have been used, and shall allow the lessor at all times, by its agents or attorneys, to examine and to take copies of such accounts and entries of the lessee as may serve to determine the total number of boots, shoes, or other footwear, or portions thereof, made by the aid of the leased machinery or any part thereof, and the lessee shall produce all such accounts and entries upon request. The lessee shall require each of his operators upon the leased machinery, or any part thereof, to keep, upon blanks or blank books to be furnished by the lessor, accurate daily records of the number of each kind of boots, shoes, and other footwear, or portions thereof, in the making of which he has used the leased machinery or any part thereof, and shall require his operators to sign such records, and, if requested so to do by the lessor, shall verify the same under oath. The lessee shall send to the office of the lessor in Boston, on or before the fifth day of each

calendar month, the original records for the next preceding calendar month kept by his operators as above provided for; and in case, in any calendar month, none of the leased machinery has been used, the lessee shall notify the lessor in writing of that fact, on or before the fifth day of the next succeeding calendar month. The lessee shall also furnish any further information which may called for in relation to the leased machinery or the use thereof.

And that the following agreements, stipulations, and provisions are agreed to: —

Seven. If at any time the lessee shall fail or cease to use exclusively lasting machinery held by him under lease from the lessor for lasting all boots, shoes, and other footwear made by or for him, which are lasted by the aid of machinery, or shall fail or cease to use exclusively tacking mechanisms and appliances held by him under lease from the lessor, for doing all work in the manufacture of all boots, shoes, and other footwear made by or for him which is done by the aid of tacking mechanisms and appliances, the lessor, although it may have waived or ignored prior instances of such failure or cessation, may at its option terminate forthwith by notice in writing this lease and license and any other lease or license of lasting machines, lasting machinery, lasting mechanisms, or lasting devices then existing between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise; and the possession of and full right to and control of all the leased machinery and all lasting machines, lasting machinery, lasting mechanisms, and lasting devices held by the lessee under lease or license from the lessor or its assignors shall thereupon revest in the lessor free from all claims and demands whatsoever.

Eight. This lease and license shall continue, unless sooner terminated by the lessor because of breach thereof on the part of the lessee, or otherwise as herein provided, for seventeen years from the date hereof. But if any breach or default shall be made in the observance of any one or more of the conditions herein contained or contained in any other lease or license agreement subsisting between the lessor and the lessee whether as the result of assignment to the lessor or otherwise and expressed to be obligatory upon

the lessee, the lessor shall have the right by notice in writing to the lessee to terminate forthwith this lease and license, and also if the lessor so elects any other lease or license agreements then in force between the lessor and the lessee whether as the result of assignment to the lessor or otherwise, and this notwithstanding that previous breaches or defaults may have been unnoticed, waived or condoned by or on behalf of the lessor. If, upon the expiration of the full term of this lease, the lessor does not request the return of the leased machinery, then the leased machinery shall continue to be held and used under and in accordance with the conditions of this lease and license, which shall thereupon be extended indefinitely as to term; but thereafter either the lessee or the lessor, upon sixty days' notice in writing to the other, may terminate this lease and license, whereupon the leased machinery shall be delivered forthwith to the lessor, as herein provided. Upon the expiration or termination of this lease and license or any extension thereof by notice or by reason of any default on the part of the lessee as to the terms of this lease and license or any other lease or license from the lessor, or otherwise as herein provided, the lessee shall forthwith deliver the leased machinery to the lessor at its office or factory in good order, reasonable wear and tear alone excepted; and shall thereupon pay to the lessor the sum of One Hundred (100) Dollars for each Chase Lasting Machine and its accessories as compensation for setting up the leased machinery in his factory, for instructing operators and for deterioration of the leased machinery, and the lessee for himself, his heirs, executors, and administrators, hereby grants to the lessor, its successors and assigns, full right, power and authority to enter upon the premises and into any factory, room, or any place where the leased machinery, or any part thereof may be, and take possession thereof, and take away the same; and the lessee shall have no claim for the repayment of any sum or sums, or any part thereof, which he shall have paid as consideration for the grant of this lease and license or for rent or royalty, or otherwise in respect to the leased machinery. The lessee shall also without prejudice to any other rights and remedies of the lessor hereunder pay to the lessor such sums as may be

necessary to put the leased machinery in suitable order and condition to lease to another lessee as well as paying the freight expense of returning the same.

Nine. A notice in writing, signed by the president, a vice-president, or the treasurer of the lessor or by any assignee of the lessor's rights hereunder and posted by prepaid letter, addressed to the lessee or delivered at his usual or last known place of abode or business, that the lease and license hereby granted is determined or shall be determined at the expiration of a certain period, shall be a sufficient determination of the lease and license from the time of posting or delivering such notice, or from the expiration of the period therein mentioned, as the case may be. Any termination of this lease and license shall not release the lessee from his obligation to pay rent or royalty for the period prior to such termination, and shall be without prejudice to any other rights or remedies which the lessor may have for violation of contract, use of machines without right or use of patented inventions without license.

Ten. The lessee admits the validity of each and every of the Letters Patent of the United States of America, owned by the lessor or under which it is licensed, any of the inventions of which are or hereafter may be embodied in the leased machinery. The lessee also agrees that he will not directly or indirectly infringe or contest the validity of or the title of the lessor to any of the patents referred to in the "Schedule of Patents" hereto annexed. The termination or cesser of this lease and license from any cause whatever shall not in any way affect the provisions of this clause or release or discharge the lessee from the admission and estoppel herein set forth.

Eleven. None of the terms or conditions of this lease and license shall be held to have been waived by any act or knowledge of the lessor, its agents or employees, but only by an instrument in writing, signed by the president, a vice-president, or the treasurer of the lessor.

Twelve. The term "lessor" shall include the said United Shoe Machinery Company and its successors and assigns. All the con-

ditions and agreement binding on the lessee shall be binding on and enforceable against his legal representatives. In the construction of this instrument, words relating to the number and gender of the parties shall be read according to their real number and gender.

In Witness Whereof, the parties hereto have duly executed this instrument in duplicate, the day and year first above written.

Lease and License Nunmber *263*.

McKay & Copeland Lasting Machine.

This Lease and Agreement made at Boston in the State of Massachusetts this *First* day of *June* 19*03*, between the United Shoe Machinery Company, a corporation organized under the laws of the State of New Jersey, having an office in said Boston, hereinafter referred to as the lessor, of the one part, and *Parker & Peakes Company* of *Bangor* in the State of *Maine*, hereinafter referred to as the lessee, of the other part:

Witnesseth, that the lessor, in consideration of the covenants and agreements on the part of the lessee herein contained, does hereby lease to and license the lessee under its patents to use

McKay & Copeland Lasting Machine, No. *312, 316, 319, 321,*

Brock Hand Tacker, No. *569, 573, 576, 582, 567,*

Copeland Pinking Machine, No. *319, 320, 321, 331,* now or hereafter delivered to the lessee and any duplicate parts, extras, mechanisms and devices relating thereto, or used in connection therewith, now attached to or delivered with the said designated machine or machines or which may at any time hereafter be obtained from the lessor, or be added thereto with the consent of the lessor (the whole of which machine or machines, duplicate parts, extras, mechanisms and devices, held by the lessee under these presents, whether now or hereafter delivered to or in the possession of the lessee, is hereinafter referred to as the "leased machinery"), subject to the conditions hereinafter contained.

And that the following are agreed to as conditions of the lease and license of the leased machinery, all of which the lessee covenants and agrees to keep and perform: —

One. The leased machinery shall at all times remain and be the sole and exclusive property of the lessor, and the lessee shall have no right of property therein but only the right to use the same, upon the conditions herein contained. The leased machinery shall be used only by the lessee himself, or by operatives in his direct employ, and only in the factory now occupied by him at *Bangor* in the State of *Maine*. The leased machinery shall not be transferred or delivered or sublet to any other person or corporation, and neither the lease nor the license nor the license hereby granted can be assigned by the lessee by his own act or by operation of law. If the lessee becomes insolvent or bankrupt, or has a receiving order made against him, or makes or executes any bill of sale, deed of trust or assignment for the benefit of his creditors, or if a sale or lease or removal of the leased machinery, or any part thereof, without the consent in writing of the lessor, be made or attempted, or if any distress or execution or attachment be levied thereon, then and in each such case this lease and license and any other lease or license then existing between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, shall at the option of the lessor cease and determine, and the possession of and full right to and control of all the leased machinery, and any machinery held by the lessee under any other

lease or license from the lessor, whether as the result of assignment to the lessor or otherwise, shall thereupon revest in the lessor free from all claims or demands whatsoever. The lessor and its agents and employees shall at all times be given access to the leased machinery for the purpose of inspecting it or watching its use and operation, or of altering, repairing, improving, or adding to it, or determining the nature or extent of its use, and the lessee shall afford all reasonable facilities therefor.

Two. The lessee shall at all times and at his own expense keep the leased machinery in good and efficient working order and condition, and shall not permit any one to injure or deface or remove any plate, or dates, numbers, or other inscriptions now or hereafter impressed on or affixed to the leased machinery by the lessor. The lessee shall obtain from the lessor exclusively, and shall pay therefor at the regular prices from time to time established by the lessor, all the duplicate parts, extras, mechanisms and devices of every kind needed or used in operating, repairing, or renewing the leased machinery, and the same shall form part of the leased machinery, and the lessee shall not otherwise make or allow to be made any addition, subtraction, or alteration to, from, or in the leased machinery without the consent in writing of the lessor, nor interfere with the proper operation of the same. The lessee shall also purchase from the lessor exclusively at the prices from time to time established by the lessor all string-nail, tack strips and other fastening material used in or in connection with the leased machinery.

Three. The lessee shall pay all taxes and assessments which shall be levied in respect to the leased machinery, or in respect to this lease and license, or the right to payments hereunder upon whomsoever assessed.

Four. The lessee shall use the leased machinery to its full capacity on all boots, shoes, and other footwear made in his factory in the manufacture of which it can be used, but the leased machinery shall not nor shall any part thereof be used in the manufacture of any boots shoes, or other footwear which are or are to be welted or the soles stitched or attached to their uppers by welting or stitching or sewing

machines not leased to the lessee by the lessor or its assignors, or in the manufacture of any boots, shoes, or other footwear which have been or shall be pegged, slugged, heel seat nailed, or otherwise partly made by the aid of any pegging or "metallic" machinery not leased to the lessee by the lessor or its assignors, or in the manufacture of any boots, shoes or other footwear, the heels of which have been or are to be compressed or prepared by the lessee in whole or in part or shall be attached by any "heeling" machinery not leased to the lessee by the lessor or its assignors.

Five. The lessee shall pay to the lessor immediately after the execution hereof as a lease premium the sum of dollars, and the lessee shall also pay to the lessor on the last day of each calendar month as rent or royalty the sum of one and one-half (1½) cents for each pair of long-legged boots and of one (1) cent for each pair of all other kinds of boots, shoes, and other footwear, or portions thereof, lasted or manufactured or prepared during the next preceding calendar month in any way, whether wholly or in part, by the aid of the leased machinery or any part thereof; **provided, however, that in all cases when the lessee shall pay to the lessor on or before the fifteenth day of the calendar month the rent or royalty due for the use of the leased machinery for the next preceding calendar month, the lessor will in consideration of such prompt payment grant a discount of fifty per cent. from such rent or royalty due for such preceding calendar month.** If, for any cause, the leased machinery shall not be in use for twelve (12) consecutive months to the extent of its earning for the lessor at the rental and royalty herein provided to be paid (less all abatements) an amount equal to or in excess of one hundred and twenty-five dollars ($125) for each McKay & Copeland Lasting Machine hereby leased, then the lessor may, by paying to the lessee a sum equal to one-third (⅓) of the sum paid by the lessee to the lessor as above set forth as the lease premium hereunder, cancel and terminate this lease and license, and this option and condition shall be independent of any other options and conditions in this lease and license contained.

Six. The lessor may attach to the leased machinery, or any

thereof, an indicator or indicators to register the number of revolutions or movements of any part or parts thereof, and the lessee shall not allow any person (other than the lessor or its agents) to disturb or interfere with such indicator or indicators. In case any indicator thus attached shall from any cause cease to correctly indicate or register, or shall be disturbed or out of repair, or if the glass covering any such indicator shall be removed or broken or injured, then, and as often as the same shall happen, the lessee shall immediately, by writing, notify the lessor, and at the same time explain the circumstances under which the same has happened. In case any such indicator ceases to indicate, or becomes or remains inaccurate, or the glass covering becomes or remains removed, broken or injured, because of any fault of the lessee or any one in his employ, or because of the failure of the lessee to give promptly the notice hereinbefore provided for, then, without prejudice to any other rights of the lessor hereunder, the lessee shall pay the lessor as rent or royalty, without the right to any discount, the sum of two cents per pair for each pair of boots, shoes, and other footwear, or portions thereof, in the manufacture of which the leased machinery or any part thereof shall have been used. The lessee shall keep full and accurate accounts, independently of any indicators that may be placed upon the leased machinery, showing the number of each kind of boots, shoes, and other footwear, or portions thereof, in the manufacture of which the leased machinery or any part thereof shall have been used, and shall allow the lessor at all times, by its agents or attorneys, to examine and to take copies of such accounts and entries of the lessee as may serve to determine the total number of boots, shoes and other footwear or portions thereof made by the aid of the leased machinery or any part thereof, and the lessee shall produce all such accounts and entries upon request. The lessee shall require each of his operators upon the leased machinery or any part thereof to keep upon blanks or blank books to be furnished by the lessor accurate daily records of the number of each kind of boots, shoes, and other footwear, or portions thereof, in the making of which he has used the leased machinery or any part thereof,

and shall require his operators to sign such records, and, if requested so to do by the lessor, shall verify the same under oath. The lessee shall send to the office of the lessor in Boston, on or before the fifth day of each calendar month, the original records for the next preceding calendar month kept by his operators as above provided for; and in case, in any calendar month, none of the leased machinery has been used, the lessee shall notify the lessor in writing of that fact, on or before the fifth day of the next succeeding calendar month. The lessee shall also furnish any further information which may be called for in relation to the leased machinery or the use thereof.

And that the following agreements, stipulations, and provisions are agreed to:—

Seven. If at any time the lessee shall fail or cease to use exclusively lasting machinery held by him under lease from the lessor for lasting all boots, shoes, and other footwear made by or for him, which are lasted by the aid of machinery, or shall fail or cease to use exclusively lasting and tacking mechanisms and appliances held by him under lease from the lessor, for doing all work in the manufacture of all boots, shoes, and other footwear made by or for him which is done by the aid of lasting and tacking mechanisms and appliances, the lessor, although it may have waived or ignored prior instances of such failure or cessation, may at its option terminate forthwith by notice in writing this lease and license and any other leases or licenses of lasting machines, lasting machinery, and lasting and tacking mechanisms and appliances then existing between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise; and the possession of and full right to and control of all the leased machinery and all lasting machines, lasting machinery, and lasting and tacking mechanisms and appliances held by the lessee under lease or license from the lessor or its assignors shall thereupon revest in the lessor free from all claims and demands whatsoever.

Eight. This lease and license shall continue, unless sooner terminated by the lessor because of breach thereof on the part of the lessee, or otherwise as herein provided, for seventeen years from

the date hereof. But if any breach or default shall be made in the observance of any one or more of the conditions herein contained or contained in any other lease or license agreement subsisting between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, and expressed to be obligatory upon the lessee, the lessor shall have the right, by notice in writing to the lessee, to terminate forthwith this lease and license, and also if the lessor so elects any other lease or license agreements then in force between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, and this notwithstanding that previous breaches or defaults may have been unnoticed, waived, or condoned by or on behalf of the lessor. If, upon the expiration of the full term of this lease, the lessor does request the return of the leased machinery, then the leased machinery shall continue to be held and used under and in accordance with the conditions of this lease and license, which shall thereupon be extended indefinitely as to term; but thereafter either the lessee or the lessor, upon sixty days' notice in writing to the other, may terminate this lease and license, whereupon the leased machinery shall be delivered forthwith to the lessor, as herein provided. Upon the expiration of this lease and license or any extension thereof or its termination by notice or by reason of any default on the part of the lessee as to the terms of this lease and license or any other lease or license from the lessor, or otherwise in any manner whatsoever, the lessee shall forthwith deliver the leased machinery to the lessor at its office or factory in good order, reasonable wear and tear alone excepted; and the lessee, for himself, his heirs, executors and administrators, hereby grants to the lessor, its successors and assigns, full right, power, and authority to enter upon the premises and into any factory, room, or any place where the leased machinery or any part thereof may be, and take possession thereof, and take away the same; and in no case (except ing in the event of the exercise by the lessor of the option to terminate, provided for in Article Five hereof, for failure to use to the amount therein provided) shall the lessee have any claim for the repayment of any sum or sums or any part thereof, which

he shall have paid as consideration for the grant of this lease and license or for rent or royalty, or otherwise in respect to the leased machinery.

Nine. A notice in writing, signed by the president, a vice-president, or the treasurer of the lessor, or by any assignee of the lessor's rights hereunder, and posted by prepaid letter, addressed to the lessee or delivered at his usual or last known place of abode or business, that the lease and license hereby granted is determined or shall be determined at the expiration of a certain period, shall be a sufficient determination of the lease and license from the time of posting or delivering such notice, or from the expiration of the period therein mentioned, as the case may be. Any termination of this lease and license shall not release the lessee from his obligation to pay rent for royalty for the period prior to such termination, and shall be without prejudice to any other rights or remedies which the lessor may have for violation of contract, use of machines without right, or use of patented inventions without license.

Ten. The lessee admits the validity of each and every of the Letters Patent of the United States of America, owned by the lessor or under which it is licensed, any of the inventions of which are or hereafter may be embodied in the leased machinery. The lessee also agrees that he will not directly or indirectly infringe or contest the validity of, or the title of the lessor to, any of the patents referred to in the "Schedule of Patents" hereto annexed. The termination or cesser of this lease and license from any cause whatever shall not in any way affect the provisions of this clause, or release or discharge the lessee from the admission and estoppel herein set forth.

Eleven. None of the terms or conditions of this lease and license shall be held to have been waived by any act or knowledge of the lessor, its agents or employees, but only by an instrument in writing, signed by the president, a vice-president, or the treasurer of the lessor.

Twelve. The term "lessor" shall include the said United Shoe Machinery Company and its successors and assigns. All the con-

ditions and agreements binding on the lessee shall be binding on and enforceable against his legal representatives. In the construction of this instrument, words relating to the number and gender of the parties shall be read according to their real number and gender.

In witness whereof, the parties hereto have duly executed this instrument in duplicate, the day and year first above written.

Lease and License Agreement Number .

U. S. M. Co. Lasting Machine No. 5.

This Agreement made at Boston, in the State of Massachusetts, this day of , 19 , between the United Shoe Machinery Company, a corporation organized under the laws of the State of New Jersey, having an office in said Boston, hereinafter referred to as the lessor, of the one part, and of in the State of , hereinafter referred to as the lessee, of the other part:

Witnesseth, that the lessor, in consideration of the covenants and agreements on the part of the lessee herein contained, does hereby lease to and license the lessee under any letters patent belonging to the lessor or under which the lessor has the right to grant such license affecting any inventions which are now or hereafter shall be embodied therein or employed in the operation thereof, to use the machine or machines of the Lasting Machine Department of the lessor now or hereafter delivered to the lessee and designated by number or numbers in the following schedule, viz: —

SCHEDULE OF MACHINES.

U. S. M. Co. Lasting Machine(s) No. 5, No(s).
Loose Tacker(s), No(s).

and any duplicate parts, extras, mechanisms and devices relating thereto, or used in connection therewith, now attached to or delivered with the said designated machine or machines or which may at any time hereafter be obtained from the lessor, or be added thereto by or with the consent of the lessor (the whole of which machine or machines, duplicate parts, extras, mechanisms and devices held by the lessee under these presents, whether now or hereafter delivered to or in the possession of the lessee, is hereinafter referred to as the "leased machinery"), subject to the conditions hereinafter contained.

And that the following are agreed to as conditions of this agree-

ment, all of which the lessee covenants and agrees to keep and perform: —

One. The leased machinery shall at all times remain and be the sole and exclusive property of the lessor, and the lessee shall have no right of property therein, but only the right to use the same, upon the conditions herein contained. The leased machinery shall be used only by the lessee himself or by operatives in his direct employ, and only in the factory now occupied by him at in the State of unless the lessor shall by an instrument in writing signed by its president, vice-president or treasurer authorize the lessee to remove the leased machinery and to use the same elsewhere. The leased machinery shall not be transferred or delivered or sublet to any other person or corporation, and neither this agreement nor the lease nor the license hereby granted can be assigned by the lessee by his own act or by operation of law. If the lessee becomes insolvent or bankrupt, or has a receiving order made against him, or makes or executes any bill of sale, deed of trust or assignment for the benefit of his creditors, or if a sale, mortgage, lease or unauthorized removal of the leased machinery, or any part thereof, be made or attempted, or if any distress or execution or attachment be levied thereon, then and in each such case any or all leases of or licenses to use machinery then existing between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, shall at the option of the lessor cease and determine, and the possession of and full right to and control of all machinery the leases or licenses of which are so terminated, shall thereupon revest in the lessor free from all claims and demands whatsoever. The lessor and its agents and employees shall at all times be given access to the leased machinery for the purpose of inspecting it or watching its use and operation, or of altering, repairing, improving, or adding to it, or determining the nature or extent of its use, and the lessee shall afford all reasonable facilities therefor.

Two. The lessee shall at all times and at his own expense keep the leased machinery in good and efficient working order and condition, and shall not permit any one to injure or deface or remove

any plate, or dates, numbers, or other inscriptions now or hereafter impressed on or affixed to the leased machinery by the lessor. The lessee shall obtain from the lessor exclusively, and shall pay therefor at the regular prices from time to time established by the lessor, all the duplicate parts, extras, mechanisms and devices, of every kind needed or used in operating, repairing, or renewing the leased machinery, and the same shall form part of the leased machinery, and the lessee shall not otherwise make or allow to be made any addition, subtraction or alteration to, from, or in the leased machinery, nor interfere with the proper operation of the same.

Three. The leased machinery shall at all times, until the expiration or termination of the lease thereof and license to use the same hereby granted and the re-delivery of the leased machinery into the possession of the lessor as hereinafter provided, be held at the sole risk of the lessee from injury, loss or destruction, and in case any machine or machines hereby leased shall be destroyed by fire or otherwise before such expiration or termination and re-delivery, the lessee shall pay to the lessor upon demand the sum of Two Hundred and Twenty-five Dollars ($225) in respect to each lasting machine so destroyed as partial reimbursement to the lessor for such destruction, and the lessee shall forthwith return whatever remains of all the machinery so destroyed to the lessor at Beverly, Massachusetts.

Four. The lessee shall pay all taxes and assessments which shall be assessed in respect to the leased machinery or other machinery of the lessor held by the lessee under lease or license upon whomsoever assessed. All taxes or assessments in respect to leases, licenses or agreements covering machinery, or the rights to payments thereunder, shall be construed, for the purposes of this article, to be assessed in respect to the machinery itself. In case at any time any unapportioned tax or assessment shall be assessed to the lessor in respect in part but not wholly to machinery of the lessor in the possession of the lessee the lessee shall pay to the lessor such proportionate part of the total amount of said unapportioned tax or assessment as the fair valuation, to be determined by the

lessor, of said machinery of the lessor in the possession of the lessee bears to the fair valuation, to be determined by the lessor, of all machinery (excepting machinery, if any, in the lessor's own possession) in respect to which the unapportioned tax or assessment has been assessed; provided, however, that if such unapportioned tax or assessment includes any tax or assessment in respect to tangible property in the lessor's own possession the amount thereof, based, at the established rate, upon the fair valuation, to be determined by the lessor, of such property, shall first be deducted and the lessee shall pay his proportionate part as aforesaid of the balance only of said unapportioned tax or assessment after such deduction has been made.

Five. The leased machinery shall be used for no other purpose than for lasting boots, shoes or other footwear made by or for the lessee. The leased machinery shall not nor shall any part thereof be used in the manufacture or preparation of any welted boots, shoes or other footwear or portions thereof which have been or shall be welted in whole or in part or the soles in whole or in part stitched by the aid of any welt sewing or sole stitching machinery not held by the lessee under lease from the lessor, or in the manufacture or preparation of any turned boots, shoes or other footwear or portions thereof the soles of which have been or shall be in whole or in part attached to their uppers by the aid of any turn sewing machinery not held by the lessee under lease from the lessor or in the manufacture of any boots, shoes or other footwear which have been or shall be in whole or in part pulled over, slugged, heel seat nailed or otherwise partly made by the aid of any pulling over or "Metallic" machinery not held by the lessee under lease from the lessor. Subject to the foregoing limitations, the lessee shall use the leased machinery to its full capacity upon all boots, shoes or other footwear or portions thereof made by or for the lessee in the manufacture or preparation of which such machinery is capable of being used.

Six. The lessee shall pay to the lessor on the last day of each calendar month as rent or royalty the sum of one and one-quarter (1¼) cents for each pair of boots, shoes or other footwear, or por-

tions thereof, lasted or manufactured or prepared during the next preceding calendar month in any way, whether wholly or in part, by the aid of the leased machinery or any part thereof; **provided, however, that in all cases when the lessee shall pay to the lessor on or before the fifteenth day of the calendar month the rent or royalty due for the use of the leased machinery for the next preceding calendar month, the lessor will in consideration of such prompt payment grant a discount of fifty per cent. from such rent or royalty due for such preceding calendar month.** The lessee guarantees that for each Lasting Machine hereby leased the rent or royalty herein provided (less all abatements) shall amount in each calendar year, ending December 31, to at least ten (10) dollars for each calendar month and at the end of each such calendar year the lessee shall pay to the lessor the amount, if any, by which the rent or royalty paid for said year is less than such guaranteed rent or royalty.

Seven. The lessor may attach to the leased machinery or any thereof an indicator or indicators to register the number of revolutions or movements of any part or parts thereof, and the lessee shall not allow any person (other than the lessor or its agents) to disturb or interfere with any such indicator or indicators. In case any indicator thus attached shall from any cause cease to correctly indicate or register, or shall be disturbed or out of repair, or if the glass covering any such indicator shall be removed or broken or injured, then and as often as the same shall happen the lessee shall immediately by writing notify the lessor and at the same time explain the circumstances under which the same has happened. In case any such indicator ceases to indicate, or becomes or remains inaccurate, or the glass covering becomes or remains removed, broken, or injured, because of any fault of the lessee or any one in his employ, or because of the failure of the lessee to give promptly the notice hereinbefore provided for, then, without prejudice to any other rights or remedies of the lessor hereunder, the lessee shall pay the lessor as rent or royalty, without the right to any discount, the sum of one and one-quarter (1¼) cents per pair for each pair of boots, shoes or other footwear or portions thereof, in the manu-

facture or preparation of which the leased machinery or any part thereof shall have been used. The lessee shall keep full and accurate accounts, independently of any indicators that may be placed upon the leased machinery, showing the number of boots, shoes and other footwear, or portions thereof, in the manufacture or preparation of which the leased machinery, or any part thereof, has been used, and shall allow the lessor at all times, by its agents or attorneys, to examine and to take copies of such accounts and entries of the lessee as may serve to determine the total number of boots, shoes and other footwear, or portions thereof, made or prepared by the aid of the leased machinery or any part thereof, and the lessee shall produce all such accounts and entries upon request. The lessee shall require each of his operators upon the leased machinery, or any part thereof, to keep upon the blank or blank-books to be furnished by the lessor accurate daily records of the number of boots, shoes and other footwear, or portions thereof, in the making or preparation of which he has used the leased machinery or any part thereof, and shall require his operators to sign such records, and, if requested so to do by the lessor, shall verify the same under oath. The lessee shall send to the office of the lessor in Boston, on or before the fifth day of each calendar month, the original records for the next preceding calendar month kept by his operators as above provided for; and in case, in any calendar month, any one or more of the machines hereby leased has been entirely idle, the lessee, on or before the fifth day of the next succeeding calendar month, shall send to the office of the lessor in Boston the blank for said month for each such idle machine marked "not in use" and signed by the lessee. The lessee shall also furnish any further information which may be called for in relation to the leased machinery or the use thereof.

And that the following stipulations and provisions are agreed to: —

Eight. If at any time the lessee shall fail or cease to use exclusively lasting machinery held by him under lease from the lessor for lasting all boots, shoes and other footwear made by or for him, which are lasted by the aid of machinery, or shall fail or cease to

use exclusively tacking mechanisms and appliances held by him under lease from the lessor, for doing all work in the manufacture of all boots, shoes, and other footwear made by or for him which is done by the aid of tacking mechanisms and appliances, the lessor, although it may have waived or ignored prior instances of such failure or cessation, may at its option terminate forthwith by notice in writing any or all leases or licenses of lasting machines, lasting machinery, lasting mechanisms, or lasting devices then existing between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise; and the possession of and full right to and control of all lasting machines, lasting machinery, lasting mechanisms, and lasting devices the lease or license of which is so terminated shall thereupon revest in the lessor free from all claims and demands whatsoever.

Nine. The term of this agreement shall be seventeen years from the date hereof. The lease of the leased machinery and license to use the same hereby granted shall continue, unless sooner terminated by the lessor because of breach thereof on the part of the lessee, or otherwise as in this agreement provided, for the full term of this agreement. But if any breach or default shall be made in the observance of any one or more of the conditions in this agreement contained or contained in any other lease or license agreement subsisting between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise and expressed to be obligatory upon the lessee, the lessor shall have the right by notice in writing to the lessee to terminate forthwith any or all leases of or licenses to use machinery then in force between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, and this notwithstanding that previous breaches or defaults may have been unnoticed, waived, or condoned by or on behalf of the lessor. If, upon the expiration of the full term of this agreement, the lessor does not request the return of the leased machinery, then the leased machinery shall continue to be held and used under and in accordance with the conditions, stipulations and provisions in this agreement contained and this agreement and the lease and license herein contained shall thereupon be extended

indefinitely as to term; but thereafter either the lessee or the lessor, upon sixty days' notice in writing to the other, may terminate this agreement and the lease and license herein contained, whereupon the leased machinery shall be delivered forthwith to the lessor, as herein provided. Upon the expiration or termination of this agreement or any extension thereof or of the lease and license herein contained by notice or by reason of any default on the part of the lessee as to the terms of this agreement or of any other lease or license agreement from the lessor or otherwise, in any manner whatsoever, the lessee shall forthwith deliver the leased machinery to the lessor at Beverly, Massachusetts, complete and in good order, reasonable wear and tear alone excepted; and shall thereupon pay to the lessor without prejudice to any other rights or remedies of the lessor the sum of One Hundred and Fifty Dollars ($150) in respect to each lasting machine hereby leased as partial reimbursement to the lessor for deterioration of the leased machinery, expenses in connection with the installation thereof and instruction of operators; and the lessee for himself, his heirs, executors and administrators, successors and assigns, hereby grants to the lessor, its successors and assigns, full right, power and authority to enter upon the premises and into any factory, room, or any place where the leased machinery, or any part thereof, may be, and take possession thereof, and take away the same; and in no case shall the lessee have any claim for the repayment or offset of any sum or sums or any part thereof which shall have been paid under this agreement or in respect to the lease or license herein contained or in any wise in respect to the leased machinery.

Ten. In case at any time the lessee shall have in his possession more lasting machines than, in the opinion of the lessor, based upon the capacity of such machines, are sufficient for performing the work which the lessee has for such machines, the lessor may at its option, upon thirty days' notice in writing to the lessee, terminate the lease of and license to use any one or more of the lasting machines hereby leased. In case, however, the lease of and license to use any such lasting machine or machines shall be thus terminated in the exercise of the option contained in this article hereof

only and not in the exercise of any other right of termination, the lessee shall pay to the lessor such sum as may be necessary to put such machine or machines, the lease and license of which is so terminated, in suitable order and condition to lease to another lessee in lieu of paying the sum of One Hundred and Fifty Dollars ($150) provided for in Article Nine hereof. The termination in the exercise of the option contained in this article hereof of the lease of and license to use any one or more machines shall not affect the lease of or license to use any other machine or machines or the obligations of the lessee in respect thereto.

Eleven. In case at any time the leased machines, or any thereof, shall have parts missing or broken or shall not otherwise, in the opinion of the lessor, be in good and efficient working order and condition, the lessor, without prejudice to any other of its rights or remedies, may forthwith put the same in good and efficient working order and condition, and may replace all broken or missing parts, and the lessee shall forthwith pay the lessor the expense of making such repairs and for all parts supplied at the regular prices established by the lessor for such parts.

Twelve. A notice in writing, signed by the president, a vice-president, the treasurer or an assistant treasurer of the lessor or by any assignee of the lessor's rights hereunder, and posted by prepaid letter, addressed to the lessee or delivered at his usual or last known place of abode or business, that the lease or license hereby granted is terminated or shall be terminated at the expiration of a certain period, shall be a sufficient termination of the lease and license from the time of posting or delivering such notice, or from the expiration of the period therein mentioned, as the case may be. Any termination of this agreement or of the lease and license hereby granted shall not release the lessee from his obligation to pay rent or royalty for the period prior to such termination and shall be without prejudice to any other rights or remedies which the lessor may have for violation of contract, use of machines without right or use of patented inventions without license.

Thirteen. The lessee admits the validity for the full term expressed in the grant thereof (and every extension and renewal

thereof) of each and every of the Letters Patent of the United States of America, owned by the lessor or under which it is licensed, any of the inventions of which are or hereafter may be embodied in the leased machinery. The lessee also agrees that he will not directly or indirectly infringe or contest the validity for the full term expressed in the grant thereof or of any extension or renewal thereof, or of any of the Letters Patents referred to in the Schedule of Patents hereto annexed or the title of the lessor thereto. The expiration of this agreement or any extension thereof or the termination or cesser of the lease and license hereby granted shall not in any way affect the provisions of this clause, or release or discharge the lessee from the admissions and estoppels herein set forth.

Fourteen. None of the conditions, stipulations or provisions of this agreement shall be held to have been waived by any act or knowledge of the lessor, its agents or employees, but only by an instrument in writing, signed by the president, a vice-president or the treasurer of the lessor.

Fifteen. The term "lessor" shall include the said United Shoe Machinery Company and its successors and assigns. All the conditions, stipulations and provisions binding on the lessee shall be binding on and enforceable against his legal representatives. In the construction of this instrument, words relating to the number and gender of the parties shall be read according to their real number and gender.

In witness whereof, the parties hereto have duly executed this instrument in duplicate, the day and year first above written.

Lease and License Agreement Number .

U. S. M. Co. Lasting Machine No. 5.

This Agreement made at Boston, in the State of Massachusetts, this day of , 19 , between the United Shoe Machinery Company, a corporation organized under the laws of the State of New Jersey, having an office in said Boston, hereinafter referred to as the lessor, of the one part, and of in the State of , hereinafter referred to as the lessee, of the other part:

Witnesseth, that the lessor, in consideration of the covenants and agreements on the part of the lessee herein contained, does hereby lease to and license the lessee under any letters patent belonging to the lessor or under which the lessor has the right to grant such license affecting any inventions which are now or here-

after shall be embodied therein or employed in the operation thereof, to use the machine or machines of the Lasting Machine Deparment of the lessor now or hereafter delivered to the lessee and designated by number or numbers in the following schedule, viz:

SCHEDULE OF MACHINES

U. S. M. Co. Lasting Machine(s) No. 5, No(s).
Loose Tacker(s), No(s).

and any duplicate parts, extras, mechanisms and devices relating thereto, or used in connection therewith, now attached to or delivered with the said designated machine or machines, or which may at any time hereafter be obtained from the lessor, or be added thereto by or with the consent of the lessor (the whole of which machine or machines, duplicate parts, extras, mechanisms and devices held by the lessee under these presents, whether now or hereafter delivered to or in the possession of the lessee, is hereinafter referred to as the "leased machinery"), subject to the conditions hereinafter contained.

And that the following are agreed to as conditions of this agreement, all of which the lessee covenants and agrees to keep and perform:—

One. The leased machinery shall at all times remain and be the sole and exclusive property of the lessor, and the lessee shall have no right of property therein, but only the right to use the same upon the conditions herein contained. The leased machinery shall be used only by the lessee himself, or by operatives in his direct employ, and only in the factory now occupied by him at in the State of , unless the lessor shall by an instrument in writing, signed by its president, vice-president or treasurer, authorize the lessee to remove the leased machinery and to use the same elsewhere. The leased machinery shall not be transferred or delivered or sublet to any other person or corporation, and neither this agreement nor the lease nor the license hereby granted can be assigned by the lessee by his own act or by operation of law. If the lessee becomes insolvent or bankrupt, or has a receiving order made against him, or makes or executes any bill of sale, deed of

trust or assignment for the benefit of his creditors, or if a sale, mortgage, lease or unauthorized removal of the leased machinery, or any part thereof, be made or attempted, or if any distress or execution or attachment be levied thereon, then and in each such case any or all leases of or licenses to use machinery then existing between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, shall at the option of the lessor cease and determine, and the possession of and full right to and control of all machinery the leases or licenses of which are so terminated, shall thereupon revest in the lessor free from all claims and demands whatsoever. The lessor and its agents and employees shall at all times be given access to the leased machinery for the purpose of inspecting it or watching its use and operation, or of altering, repairing, improving, or adding to it, or determining the nature or extent of its use, and the lessee shall afford all reasonable facilities therefor.

Two. The lessee shall at all times and at his own expense keep the leased machinery in good and efficient working order and condition, and shall not permit any one to injure or deface or remove any plate, or dates, numbers, or other inscriptions now or hereafter impressed on or affixed to the leased machinery by the lessor. The lessee shall obtain from the lessor exclusively, and shall pay therefor at the regular prices from time to time established by the lessor, all the duplicate parts, extras, mechanisms and devices of every kind needed or used in operating, repairing or renewing the leased machinery, and the same shall form part of the leased machinery, and the lessee shall not otherwise make or allow to be made any addition, subtraction or alteration to, from or in the leased machinery or interfere with the proper operation of the same.

Three. The lessee shall pay all taxes and assessments which shall be assessed in respect to the leased machinery or other machinery of the lessor held by the lessee under lease or license upon whomsoever assessed. All taxes or assessments in respect to leases, licenses or agreements covering machinery, or the rights to payments thereunder, shall be construed, for the purposes of this arti-

cle, to be assessed in respect to the machinery itself. In case at any time any unapportioned tax or assessment shall be assessed to the lessor in respect in part but not wholly to machinery of the lessor in the possession of the lessee the lessee shall pay to the lessor such proportionate part of the total amount of said unapportioned tax or assessment as the fair valuation, to be determined by the lessor, of said machinery of the lessor in the possession of the lessee bears to the fair valuation, to be determined by the lessor, of all machinery (excepting machinery, if any, in the lessor's own possession) in respect to which the unapportioned tax or assessment has been assessed; provided, however, that if such unapportioned tax or assessment includes any tax or assessment in respect to tangible property in the lessor's own possession the amount thereof, based, at the established rate, upon the fair valuation, to be determined by the lessor, of such property, shall first be deducted and the lessee shall pay his proportioned part as aforesaid of the balance only of said unapportioned tax or assessment after such deduction has been made.

Four. The leased machinery shall be used for no other purpose than for lasting boots, shoes or other footwear made by or for the lessee and the lessee shall use the leased machinery to its full capacity limited only by the number of boots, shoes or other footwear or portions thereof made by or for the lessee in the manufacture or preparation of which such machinery is capable of being used.

Five. The lessee shall pay to the lessor immediately after the execution hereof, as a lease premium, the sum of Three Hundred Dollars (300) for each machine hereby leased and the lessee shall also pay to the lessor on the last day of each calendar month as rent or royalty the sum of one and one-quarter (1¼) cents for each pair of boots, shoes and other footwear or portions thereof, lasted or manufactured or prepared during the next preceding calendar month in any way, whether wholly or in part, by the aid of the leased machinery or any part thereof; **provided, however that in all cases when the lessee shall pay to the lessor on or before the fifteenth day of the calendar month the rent or royalty due for**

the use of the leased machinery for the next preceding calendar month, the lessor will in consideration of such prompt payment grant a discount of fifty per cent from such rent or royalty due for such preceding calendar month. If, for any cause, the leased machinery shall not be in use for twelve (12) consecutive months to the extent of its earning for the lessor at the rental and royalty herein provided to be paid (less all abatements) an amount equal to or in excess of seventy-five dollars ($75), for each Lasting Machine hereby leased, then the lessor may, by paying to the lessee a sum equal to one-third (⅓) of the sum paid by him as the lease premium hereunder, cancel and terminate this lease and license, and this option and condition shall be independent of any other options and conditions in this lease and license contained.

Six. The lessor may attach to the leased machinery, or any thereof, an indicator or indicators to register the number of revolutions or movements of any part or parts thereof, and the lessee shall not allow any person (other than the lessor or its agents) to disturb or interfere with such indicator or indicators. In case any indicator thus attached shall from any cause cease to correctly indicate or register, or shall be disturbed or out of repair, or if the glass covering any such indicator shall be removed or broken or injured, then, and as often as the same shall happen, the lessee shall immediately, by writing, notify the lessor, and at the same time explain the circumstances under which the same has happened. In case any such indicator ceases to indicate, or becomes or remains inaccurate, or the glass covering becomes or remains removed, broken, or injured, because of any fault of the lessee or anyone in his employ, or because of the failure of the lessee to give promptly the notice hereinbefore provided for, then, without prejudice to any other rights or remedies of the lessor hereunder, the lessee shall pay the lessor as rent or royalty, without the right to any discount, the sum of one and one-quarter (1¼) cents per pair for each pair of boots, shoes or other footwear, or portions thereof, in the manufacture or preparation of which the leased machinery or any part thereof shall have been used. The lessee shall keep full and accurate accounts, independently of any indicators that may be

placed upon the leased machinery, showing the number of boots, shoes, and other footwear, or portions thereof, in the manufacture or preparation of which the leased machinery or any part thereof shall have been used, and shall allow the lessor at all times, by its agents or attorneys, to examine and to take copies of such accounts and entries of the lessee as may serve to determine the total number of boots, shoes and other footwear or portions thereof, made or prepared by the aid of the leased machinery or any part thereof, and the lessee shall produce all such accounts and entries upon request. The lessee shall require each of his operators upon the leased machinery or any part thereof to keep upon blanks or blank books to be furnished by the lessor accurate daily records of the number of boots, shoes, and other footwear, or portions thereof, in the making or preparation of which he has used the leased machinery or any part thereof, and shall require his operators to sign such records, and, if requested so to do by the lessor, shall verify the same under oath. The lessee shall send to the office of the lessor in Boston, on or before the fifth day of each calendar month the original records for the next preceding calendar month kept by his operators as above provided for; and in case, in any calendar month, any one or more of the machines hereby leased has been entirely idle, the lessee on or before the fifth day of the next succeeding calendar month shall send to the office of the lessor in Boston the blank for said month for each such idle machine marked "not in use," and signed by the lessee. The lessee shall also furnish any further information which may be called for in relation to the leased machinery or the use thereof.

And that the following stipulations and provisions are agreed to:—

Seven. If at any time the lessee shall fail or cease to use exclusively lasting machinery held by him under lease from the lessor for lasting all boots, shoes and other footwear made by or for him, which are lasted by the aid of machinery, or shall fail or cease to use exclusively tacking mechanisms and appliances held by him under lease from the lessor, for doing all work in the manufacture of all boots, shoes, and other footwear made by or for him which

is done by the aid of tacking mechanisms and appliances, the lessor, although it may have waived or ignored prior instances of such failure or cessation, may at its option terminate forthwith by notice in writing this lease and license and any other lease or license of lasting machines, lasting machinery, lasting mechanisms, or lasting devices then existing between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise; and the possession of and full right to and control of all the leased machinery and all lasting machines, lasting machinery, lasting mechanisms, and lasting devices held by the lessee under lease or license from the lessor or its assignors shall thereupon revest in the lessor free from all claims and demands whatsoever.

Eight. The term of this agreement shall be seventeen years from the date hereof. The lease of the leased machinery and license to use the same hereby granted shall continue, unless sooner terminated by the lessor because of breach thereof on the part of the lessee, or otherwise as in this agreement provided, for the full term of this agreement. But if any breach or default shall be made in the observance of any one or more of the conditions in this agreement contained or contained in any other lease or license agreement subsisting between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, and expressed to be obligatory upon the lessee, the lessor shall have the right, by notice in writing to the lessee, to terminate forthwith any or all leases of or licenses to use machinery then in force between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, and this notwithstanding that previous breaches or defaults may have been unnoticed, waived, or condoned by or on behalf of the lessor. If, upon the expiration of the full term of this agreement, the lessor does not request the return of the leased machinery, then the leased machinery shall continue to be held and used under and in accordance with the conditions, stipulations, and provisions in this agreement contained, and this agreement and the lease and license herein contained shall thereupon be extended indefinitely as to term; but thereafter either the lessee or the lessor, upon sixty days' notice in writing to the other, may terminate this

agreement and the lease and license herein contained, whereupon the leased machinery shall be delivered forthwith to the lessor, as herein provided. Upon the expiration or termination of this agreement or any extension thereof or of the lease and license herein contained, by notice or by reason of any default on the part of the lessee as to the terms of this agreement or any other lease or license agreement from the lessor or otherwise in any manner whatsoever, the lessee shall forthwith deliver the leased machinery to the lessor at Beverly, Massachusetts, complete and in good order, reasonable wear and tear alone excepted; and shall thereupon pay to the lessor such sum as may be necessary to put the leased machinery in suitable order and condition to lease to another lessee; and the lessee, for himself, his heirs, executors and administrators, successors and assigns, hereby grants to the lessor, its successors and assigns, full right, power, and authority to enter upon the premises and into any factory, room, or any place where the leased machinery or any part thereof may be, and take possession thereof, and take away the same; and in no case shall the lessee have any claim for the repayment or offset of any sum or sums, or any part thereof, which shall have been paid under this agreement or in respect to the lease or license herein contained or in any wise in respect to the leased machinery.

Nine. In case at any time the leased machines, or any thereof, shall have parts missing or broken or shall not otherwise, in the opinion of the lessor, be in good and efficient working order and condition, the lessor, without prejudice to any other of its rights or remedies, may forthwith put the same in good and efficient working order and condition, and may replace all broken or missing parts, and the lessee shall forthwith pay the lessor the expense of making such repairs and for all parts supplied at the regular prices established by the lessor for such parts.

Ten. A notice in writing, signed by the president, a vice-president, the treasurer or an assistant treasurer of the lessor, or by any assignee of the lessor's rights hereunder and posted by pre-paid letter, addressed to the lessee or delivered at his usual or last known place of abode or business, that the lease and license hereby

granted is terminated or shall be terminated at the expiration of a certain period, shall be a sufficient termination of the lease and license from the time of posting or delivering such notice, or from the expiration of the period therein mentioned, as the case may be. Any termination of this agreement or of the lease and license hereby granted shall not release the lessee from his obligation to pay rent or royalty for the period prior to such termination, and shall be without prejudice to any rights or remedies which the lessor may have for violation of contract, use of machines without right, or use of patented inventions without license.

Eleven. The lessee admits the validity for the full term expressed in the grant thereof (and every extension and renewal thereof) of each and every of the Letters Patent of the United States of America, owned by the lessor or under which it is licensed, any of the inventions of which are or hereafter may be embodied in the leased machinery. The lessee also agrees that he will not directly or indirectly infringe or contest the validity for the full term expressed in the grant thereof or of any extension or renewal thereof, of any of the Letters Patent referred to in the Schedule of Patents hereto annexed or the title of the lessor thereto. The expiration of this agreement or any extension thereof or the termination or cesser of the lease or license hereby granted shall not in any way affect the provisions of this clause, or release or discharge the lessee from the admissions and estoppels herein set forth.

Twelve. None of the conditions, stipulations, or provisions of this agreement shall be held to have been waived by any act or knowledge of the lessor, its agents or employees, but only by an instrument in writing, signed by the president, a vice-president, or the treasurer of the lessor.

Thirteen. The term "lessor" shall include the said United Shoe Machinery Company and its successors and assigns. All the conditions, stipulations and provisions binding on the lessee shall be binding on and enforceable against his legal representatives. In the construction of this instrument, words relating to the number and gender of the parties shall be read according to their real number and gender.

In witness whereof, the parties hereto have duly executed this instrument in duplicate, the day and year first above written.

Goodyear Department. [Form 1200.]

Lease and License Number *4789*.

Full Set.

This Lease and Agreement made at Boston, in the State of Massachusetts, this *twenty-fourth* day of *January* 19*01*, between the United Shoe Machinery Company, a corporation organized under the laws of the State of New Jersey, having an office in said Boston, hereinafter referred to as the lessor, of the one part, and *The Baldwin Manufacturing Company* of *Milford* in the State of *Connecticut* hereinafter referred to as the lessee, of the other part:

Witnesseth, that the lessor, in consideration of the covenants and agreements on the part of the lessee herein contained, does hereby lease to and license the lessee under its patents to use the machine or machines known as "Goodyear Department" machinery now or hereafter delivered to the lessee and designated by number or numbers in the following schedule, viz.: —

SCHEDULE OF MACHINES.

Goodyear Welt and Turn Shoe Machine, No. *1286*,
Goodyear Universal Inseam Sewing Machine No.
Goodyear Bobbin Winder (Universal), No.
Goodyear Outsole Rapid Lockstitch Machine, No. *967*,
Goodyear Bobbin Winder (Rapid), No. *528*,
Extension Edge Attachment (A), No. *556*,
Extension Edge Attachment (B), No.
Welt Beveling Attachment No.
Goodyear Welt Sewing Machine (D), No.
Goodyear Welt Grooving and Beveling Machine, No. *424*,
Goodyear Welt Splitting Machine, No. *567*,
Goodyear Channeler, { Turn / Insole / Outsole } No. *1124*,
Goodyear Welt Beater, No. *500*,
Goodyear Shank Skiving Machine, No. *202*,

Goodyear Universal Inseam Trimming Machine, No.
Goodyear Universal Rounding and Channeling Machine, No. *420*,
Goodyear Channel Opening Machine, No. *311*,
Goodyear Automatic Sole Leveling Machine, No.
Goodyear Rotary Sole Laying Machine No.
Hadaway Stitch Separating Machine, No.
Goodyear Channel Laying Machine, No.
Goodyear Flexible Sole Machine, No.
Goodyear Moulding Machine, No. *740*,
Goodyear Turn Shoe Trimming Machine, No.
Goodyear Lip Turning Machine, No.
Goodyear Improved Sole Laying Machine, No.
Goodyear Direct Leveling Machine, No.

and any duplicate parts, extras, mechanisms and devices, relating thereto, or used in connectiou therewith, now attached to or delivered with the said designated machine or machines, or which may at any time hereafter be obtained from the lessor, or be added thereto with the consent of the lessor, (the whole of which machine or machines, duplicate parts, extras, mechanisms and devices, held by the lessee under these presents, whether now or hereafter delivered to or in the possession of the lessee, is hereinafter referred to as the "leased machinery"), subject to the conditions hereinafter contained.

And that the following are agreed to as conditions of the lease and license of the leased machinery, all of which the lessee covenants and agrees to keep and perform: —

One. The leased machinery shall at all times remain and be the sole and exclusive property of the lessor, and the lessee shall have no right of property therein but only the right to use the same, upon the conditions herein contained. The leased machinery shall be used only by the lessee himself, or by operatives in his direct employ, and only in the factory now occupied by him at *Milford* in the State of *Connecticut*. The leased machinery shall not be transferred or delivered or sublet to any other person or corporation, and neither the lease nor the license hereby granted can be assigned

by the lessee by his own act or by operation of law. If the lessee becomes insolvent or bankrupt, or has a receiving order made against him, or makes or executes any bill of sale, deed of trust or assignment for the benefit of his creditors, or if a sale or lease or removal of the leased machinery, or any part thereof, without the consent in writing of the lessor, be made or attempted, or if any distress or execution or attachment be levied thereon, then and in each such case this lease and license and any other lease or license then existing between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, shall at the option of the lessor cease and determine, and the possession of and full right to and control of all the leased machinery, and any machinery held by the lessee under any other lease or license from the lessor, whether as the result of assignment to the lessor or otherwise, shall thereupon revest in the lessor free from all claims or demands whatsoever. The lessor and its agents and employees shall at all times be given access to the leased machinery for the purpose of inspecting it or watching its use and operation, or of altering, repairing, improving, or adding to it, or determining the nature or extent of its use, and the lessee shall afford all reasonable facilities therefor.

Two. The lessee shall at all times and at his own expense keep the leased machinery in good and efficient working order and condition, and shall not permit anyone to injure or deface or remove any plate, or dates, numbers, or other inscriptions now or hereafter impressed on or affixed to the leased machinery by the lessor. The lessee shall obtain from the lessor exclusively and shall pay therefor at the regular prices from time to time established by the lessor, all the duplicate parts, extras, mechanisms and devices, of every kind needed or used in operating, repairing, or renewing the leased machinery, and the same shall form part of the leased machinery, and the lessee shall not otherwise make or allow to be made any addition, subtraction or alteration to, from, or in the leased machinery without the consent in writing of the lessor, nor interfere with the proper operation of the same.

Three. The lessee shall pay all taxes and assessments which shall

be levied in respect to the leased machinery, or in respect to this lease and license or the right to payments hereunder, upon whomsoever assessed.

Four. The leased machinery shall be used only in the manufacture of boots, shoes and other footwear, known in the trade as "Goodyear Welts," which are or shall be welted and the soles stitched on welt sewing and stitching machines hereby, or by other instrument, heretofore or hereafter, leased to the lessee by the lessor or its assignor, or in the manufacture of boots, shoes or other footwear, known in the trade as "Goodyear Turns," the soles of which are or shall be attached to their uppers by turn sewing machines hereby, or by other instrument, heretofore or hereafter, leased to the lessee by the lessor or its assignor.

Five. The lessee shall pay to the lessor on the last day of each calendar month as rent or royalty the rental or royalty set forth in the following schedule for each pair of boots, shoes or other footwear or portions thereof manufactured or prepared during the next preceding calendar month in any way, whether wholly or in part by the aid of the leased machinery or any part thereof: —

SCHEDULE OF RENTS AND ROYALTIES FOR GOODYEAR WELTS AND TURNS.

	Sizes. Form No.	To. No.	Welts.	Turns.
Children's	1	10½ inclusive.	3 cents.	1 cent.
Misses'	11	2 "	4 "	1½ cents.
Women's	2½	and over.	6 "	1½ "
Youths'	9	13½ inclusive.	4 "	1½ "
Boys'	1	5 "	6 "	1½ "
Men's	5½	and over.	8 "	1½ "

provided, however, that in all cases when the lessee shall pay to the lessor on or before the fifteenth day of the calendar month the rent or royalty due for the use of the leased machinery for the next preceding calendar month, the lessor will in consideration of such prompt payment grant a discount of fifty per cent from such rent or royalty due for such preceding calendar month.

Six. The lessor may attach to the leased machinery, or any thereof, an indicator or indicators to register the number of revolutions or movements of any part or parts thereof, and the lessee shall not allow any person (other than the lessor or its agents) to disturb or interfere with such indicator or indicators. In case any indicator thus attached shall from any cause cease to correctly indicate or register, or shall be disturbed or out of repair, or if the glass covering any such indicator shall be removed or broken or injured, then and as often as the same shall happen the lessee shall immediately by writing notify the lessor and at the same time explain the circumstances under which the same has happened. In case any such indicator ceases to indicate or becomes or remains inaccurate, or the glass covering becomes or remains removed, broken, or injured because of any fault of the lessee or any one in his employ, or because of the failure of the lessee to give promptly the notice hereinbefore provided for, then, without prejudice to any other rights of the lessor hereunder, the lessee shall pay the lessor as rent or royalty, without the right to any discount, eight cents per pair for each pair of boots, shoes and other footwear, or portions thereof in the manufacture of which the leased machinery or any part thereof shall have been used. The lessee shall keep full and accurate accounts, independently of any indicators that may be placed upon the leased machinery, showing the number and kind of boots, shoes and other footwear or portions thereof in the manufacture of which the leased machinery or any part thereof shall have been used, and shall allow the lessor at all times by its agents or attorneys to examine and to take copies of such accounts and entries of the lessee as may serve to determine the total number of boots, shoes or other footwear, or portions thereof, made by the aid of the leased machinery or any part thereof, and the lessee shall produce all such accounts and entries upon request. The lessee shall require each of his operators upon the leased machinery or any part thereof to keep upon blanks or blank books to be furnished by the lessor accurate daily records of the number and kind of boots, shoes, and other footwear, or portion thereof, in the making of which he has used the leased machin-

ery or any part thereof, and shall require his operators to sign such records, and if requested so to do by the lessor, shall verify the same under oath and shall also furnish any further information called for by said blanks or blank books; and the lessee shall send to the office of the lessor in Boston, on or before the fifth day of each calendar month the original records for the next preceding calendar month kept by his operators as above provided for; and in case, in any calendar month, none of the leased machinery has been used, the lessee shall notify the lessor in writing of that fact, on or before the fifth day of the next succeeding calendar month.

And that the following agreements, stipulations and provisions are agreed to: —

Seven. If at any time the lessee shall fail or cease to use exclusively welt sewing and outsole stitching machinery held by him under lease from the lessor, in the manufacture of all welted boots, shoes or other footwear made by or for him, the welts or soles of which are sewed by the aid of machinery, the lessor, although it may have waived or ignored prior instances of such failure or cessation, may at its option terminate forthwith by notice in writing this lease and license and any other lease or license of machines, machinery or devices like those or any of them, mentioned in the foregoing "Schedule of Machines," or designed for similar purposes, then exisiting between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, and the possession of and full right to and control of all such machines, machinery or devices held by the lessee under lease or license from the lessor or its assignor shall thereupon revest in the lessor free from all claims and demands whatsoever.

Eight. This lease and license shall continue, unless sooner terminated by the lessor because of breach thereof on the part of the lessee, or otherwise as herein provided, for seventeen years from the date hereof. But if any breach or default shall be made in the observance of any one or more of the conditions herein contained or contained in any other lease or license agreement subsisting between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise and expressed to be obligatory upon

the lessee, the lessor shall have the right, by notice in writing to the lessee, to terminate forthwith this lease and license, and also if the lessor so elects any other lease or license agreements then in force between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, and this notwithstanding that previous breaches or defaults may have been unnoticed, waived, or condoned by or on behalf of the lessor. If, upon the expiration of the full term of this lease, the lessor does not request the return of the leased machinery, then the leased machinery shall continue to be held and used under and in accordance with the conditions of this lease and license, which shall thereupon be extended indefinitely as to term; but thereafter either the lessee or the lessor, upon sixty days' notice in writing to the other, may terminate this lease and license, whereupon the leased machinery shall be delivered forthwith to the lessor, as herein provided. Upon the expiration or termination of this lease and license or any extension thereof by notice or by reason of any default on the part of the lessee as to the terms of this lease and license or any other lease or license from the lessor, or otherwise as herein provided, the lessee shall forthwith deliver the leased machinery to the lessor at its office or factory in good order, reasonable wear and tear alone excepted; and the lessee for himself, his heirs, executors and administrators, hereby grants to the lessor, its successors and assigns, full right, power and authority to enter upon the premises and into any factory, room, or any place where the leased machinery or any part thereof may be, and take possession thereof, and take away the same; and the lessee shall have no claim for the repayment of any sum or sums, or any part thereof, which he shall have paid as consideration for the grant of this lease and license or for rent or royalty, or otherwise in respect to the leased machinery.

Nine. A notice in writing, signed by the president, a vice-president, or the treasurer of the lessor, or by any assignee of the lessor's rights hereunder and posted by pre-paid letter, addressed to the lessee or delivered at his usual or last known place of abode or business, that the lease and license hereby granted is determined or shall be determined at the expiration of a certain period, shall be a sufficient determination of the lease and license from the time of

posting or delivering such notice, or from the expiration of the period therein mentioned, as the case may be. Any termination of this lease and license shall not release the lessee from his obligation to pay rent or royalty for the period prior to such termination, and shall be without prejudice to any other rights or remedies which the lessor may have for violation of contract, use of machines without right, or use of patented inventions without license.

Ten. The lessee admits the validity of each and every of the Letters Patent of the United States of America, owned by the lessor or under which it is licensed, any of the inventions of which are or hereafter may be embodied in the leased machinery. The lessee also agrees that he will not directly or indirectly infringe or contest the validity of, or the title of the lessor to, any of the patents referred to in the "Schedule of Patents" hereto annexed. The termination or cesser of this lease and license from any cause whatever shall not in any way affect the provisions of this clause, or release or discharge the lessee from the admission and estoppel herein set forth.

Eleven. None of the terms or conditions of this lease and license shall be held to have been waived by any act or knowledge of the lessor, its agents or employees, but only by an instrument in writing, signed by the president, a vice-president, or the treasurer of the lessor.

Twelve. The term "lessor" shall include the said United Shoe Machinery Company and its successors and assigns. All the conditions and agreements binding on the lessee shall be binding on and enforceable against his legal representatives. In the construction of this instrument, words relating to the number and gender of the parties shall be read according to their real number and gender.

In witness whereof, the parties hereto have duly executed this instrument in duplicate, the day and year first above written.

Lease and License Agreement Number .

Sewing and Stitching Machines.

This Agreement made this day of 19 , between the United Shoe Machinery Company, a corporation organized under the laws of the State of New Jersey, hereinafter referred to as the lessor, of the one part, and of in the State of hereinafter referred to as the lessee, of the other part:

Witnesseth that the lessor, in consideration of the covenants and agreements on the part of the lessee herein contained, does hereby lease to and license the lessee under any letters patent belonging to the lessor or under which the lessor has the right to grant such license affecting any inventions which are now or hereafter shall be embodied therein or employed in the operation thereof, to use the machine or machines of the "Goodyear Department" of the lessor designated by number or numbers in the following schedule, viz.: —

SCHEDULE OF MACHINES.

Goodyear Welt and Turn Shoe Machine, No.
Goodyear Welt and Turn Shoe Machine (Model E), No.
Goodyear Universal Inseam Sewing Machine, No.
Goodyear Outsole Rapid Lockstitch Machine, No.
Extension Edge Attachment (A), No.
Extension Edge Attachment (B), No.
Welt Bevelling Attachment, No.

and any duplicate parts, extras, mechanisms and devices relating thereto, or used in connection therewith, now attached to or delivered, with the said designated machine or machines, or which may at any time hereafter be obtained from the lessor, or be added thereto, by or with the consent of the lessor (the whole of which machine or machines, duplicate parts, extras, mechanisms and devices, held by the lessee under these presents, whether now or hereafter delivered to or in the possession of the lessee, is herein-

after referred to as the "leased machinery"), subject to the conditions hereinafter contained; and the lessor hereby grants to the lessee a license to use, in connection with welted boots, shoes or other footwear made by the lessee, the welts of which have been sewed to their uppers wholly by Goodyear Welt and Turn Shoe Machines or by Goodyear Universal Inseam Sewing Machines hereby leased or now held by the lessee under lease from the lessor heretofore executed, and the outsoles of which have been stitched to their welts wholly by Goodyear Outsole Rapid Lockstitch Machines hereby leased or now held by the lessee under lease from the lessor heretofore executed, the trade name or trade mark "Goodyear Welt," and to use, in connection with turned boots, shoes or other footwear made by the lessee the soles of which have been attached to their uppers wholly by the use of Goodyear Welt and Turn Shoe Machines or Goodyear Universal Inseam Sewing Machines hereby leased or now held by the lessee under lease from the lessor heretofore executed, the trade name or trade mark "Goodyear Turn."

And that the following are agreed to as conditions of this agreement, all of which the lessee covenants and agrees to keep and perform: —

One. The leased machinery shall at all times remain and be the sole and exclusive property of the lessor, and the lessee shall have no right of property therein, but only the right to use the same, upon the conditions herein contained. The leased machinery shall be used only by the lessee himself or by operatives in his direct employ, and only in the factory now occupied by him at in the State of , unless the lessor shall by an instrument in writing, signed by its president, vice-president or treasurer, authorize the lessee to remove the leased machinery and to use the same elsewhere. The leased machinery shall not be transferred or delivered or sublet to any other person or corporation, and neither this agreement nor the lease nor the license hereby granted can be assigned by the lessee by his own act or by operation of law. If the lessee becomes insolvent or bankrupt, or has a receiving order made against him, or makes or executes any bill of sale, deed of trust

or assignment for the benefit of his creditors, or if a sale, mortgage, lease or unauthorized removal of the leased machinery, or any part thereof be made or attempted, or if any distress or execution or attachment be levied thereon, then and in each such case any or all leases of or licenses to use machinery then existing between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, shall at the option of the lessor cease and determine, and the possession of and full right to and control of all machinery the leases or licenses of which are so terminated, shall thereupon revest in the lessor free from all claims and demands whatsoever. The lessor and its agents and employees shall at all times be given access to the leased machinery for the purpose of inspecting it or watching its use and operation, or of altering, repairing, improving, or adding to it, or determining the nature or extent of its use, and the lessee shall afford all reasonable facilities therefor.

Two. The lessee shall at all times and at his own expense keep the leased machinery in good and efficient working order and condition, and shall not permit any one to injure or deface or remove any plate, or dates, numbers, or other inscriptions now or hereafter impressed on or affixed to the leased machinery by the lessor. The lessee shall obtain from the lessor exclusively, and shall pay therefor at the regular prices from time to time established by the lessor, all the duplicate parts, extras, mechanisms and devices, of every kind needed or used in operating, repairing or renewing the leased machinery, and the same shall form part of the leased machinery, and the lessee shall not otherwise make or allow to be made any addition, subtraction or alteration to, from, or in the leased machinery nor interfere with the proper operation of the same.

Three. The leased machinery shall at all times, until the expiration or termination of the lease thereof and license to use the same hereby granted and the re-delivery of the leased machinery into the possession of the lessor as hereinafter provided, be held at the sole risk of the lessee from injury, loss or destruction, and in case any welting or stitching or sewing machine or machines hereby

leased shall be lost or destroyed by fire or otherwise before such expiration or termination and re-delivery, the lessee shall pay to the lessor in respect to each such machine so lost or destroyed the sum of Two Hundred and Twenty-five (225) Dollars as partial reimbursement to the lessor for such loss or destruction, and the lessee shall forthwith return whatever remains of all the machinery so lost or destroyed to the lessor at Beverly, Massachusetts.

Four. The lessee shall pay all taxes and assessments which shall be assessed in respect to the leased machinery or other machinery of the lessor held by the lessee under lease or license upon whomsoever assessed. All taxes or assessments in respect to leases, licenses or agreements covering machinery, or the rights to payments thereunder, shall be construed, for the purposes of this article, to be assessed in respect to the machinery itself. In case at any time any unapportioned tax or assessment shall be assessed to the lessor in respect in part but not wholly to machinery of the lessor in the possession of the lessee the lessee shall pay to the lessor such proportionate part of the total amount of said unapportioned tax or assessment as the fair valuation, to be determined by the lessor, of said machinery of the lessor in the possession of the lessee bears to the fair valuation, to be determined by the lessor, of all machinery (excepting machinery, if any, in the lessor's own possession) in respect to which the unapportioned tax or assessment has been assessed; provided, however, that if such unapportioned tax or assessment includes any tax or assessment in respect to tangible property in the lessor's own possession the amount thereof, based, at the established rate, upon the fair valuation, to be determined by the lessor, of such property, shall first be deducted and the lessee shall pay his proportionate part as aforesaid of the balance only of said unapportioned tax or assessment after such deduction has been made.

Five. The leased machinery shall be used only in the manufacture of boots, shoes and other footwear made by the lessee known in the trade as "Goodyear Welts" which have been or are to be welted wholly by Goodyear Welt and Turn Shoe Machines or Goodyear Universal Inseam Sewing Machines held by the lessee

under lease from the lessor, and the soles of which have been been or are to be attached to their welts wholly by Goodyear Outsole Rapid Lockstitch Machines held by the lessee under lease from the lessor or in the maunfacture of boots, shoes or other footwear made by the lessee known in the trade as "Goodyear Turns" the soles of which have been or are to be attached to their uppers wholly by Goodyear Welt and Turn Shoe Machines or Goodyear Universal Inseam Sewing Machines held by the lessee under lease from the lessor. The lessee shall not represent or sell as "Goodyear Welts" any boots, shoes or other footwear which are not welted wholly by the use of Goodyear Welt and Turn Shoe Machines or Goodyear Universal Inseam Sewing Machines held under lease from the lessor or the soles of which are not attached to their welts wholly by the use of Goodyear Outsole Rapid Lockstitch Machines held under lease from the lessor, or as "Goodyear Turns" any boots, shoes or other footwear the soles of which are not attached to their uppers wholly by the use of Goodyear Welt and Turn Shoe Machines or Goodyear Universal Inseam Sewing Machines held under lease from the lessor. The lessee shall use the leased machinery to its full capacity in the manufacture of "Goodyear Welts" and "Goodyear Turns" limited only by the number of welted and turned boots, shoes and other footwear made by or for him.

Six. The lessee shall pay to the lessor throughout the full term of this agreement the respective amounts set forth in the following schedule in respect to each pair of welted boots, shoes or other footwear, or portions thereof, manufactured or prepared by or for the lessee, which shall have been welted in whole or in part or the soles of which shall have been in whole or in part attached to welts by the use of any welting or stitching or sewing machinery, and in respect to each pair of "turned" boots, shoes or other footwear, or portions thereof, manufactured or prepared by or for the lessee, the soles of which shall have been sewed or attached to their uppers in whole or in part by the use of any sewing or stitching machinery, viz. : —

SCHEDULE OF PAYMENTS PER PAIR.

	Sizes. From No.	To No.	Welts.	Turns.
Children's	1	10½ inclusive.	3 cents.	1 cent.
Misses'	11	2 "	4 "	1½ cents.
Women's	2½	and over.	6 "	1½ "
Youths'	9	13½ inclusive.	4 "	1½ "
Boys'	1	5 "	6 "	1½ "
Men's	5½	and over.	8 "	1½ "

Such payments shall be made on the last day of each calendar month in respect to all such boots, shoes and other footwear manufactured or prepared by or for the lessee during the next preceding calendar month, **provided, however, that in all cases when the lessee shall pay to the lessor on or before the fifteenth day of the calendar month the amount due pursuant to the Schedule in this Article hereof contained for the next preceding calendar month, the lessor will in consideration of such prompt payment grant a discount of fifty per cent. from the amount so due for such preceding calendar month.** The lessee, however, guarantees that the payments made in accordance with the foregoing Schedule of Payments under this agreement, in respect to boots, shoes or other footwear operated upon by the welting, stitching or sewing machines hereby leased (after deducting all abatements) shall amount in each calendar year to at least fifteen dollars ($15.00) for each calendar month for each welting or stitching or sewing machine hereby leased, and at the end of each calendar year the lessee shall pay to the lessor the amount, if any, by which the total of such payments for said year is less than such guaranteed amount. All payments and the guarantee in this agreement provided for are independent of and in addition to all payments and guarantees provided for in any other leases or licenses or agreements between the lessor and the lessee, provided, however, that (excepting in so far as is required by the guarantees herein contained or contained in other lease and license agreements between the lessor and the lessee), in case under any other "Goodyear Department" lease and license

agreement between the lessor and the lessee and covering one or more Goodyear Welt and Turn Shoe Machines, Goodyear Universal Inseam Sewing Machines or Goodyear Outsole Rapid Lockstitch Machines, the lessee shall have paid to the lessor the amount set forth in the Schedule of Payments in such lease and license agreement contained in respect to any pair of boots, shoes or other footwear, then the lessee shall be relieved from said payment hereunder in respect to that pair of boots, shoes or other footwear.

Seven. The lessor may attach to the leased machinery, or any thereof, an indicator or indicators to register the number of revolutions or movements of any part or parts thereof, and the lessee shall not allow any person (other than the lessor or its agents) to disturb or interfere with such indicator or indicators. In case any indicator thus attached shall from any cause cease to correctly indicate or register, or shall be disturbed or out of repair, or if the glass covering any such indicator shall be removed or broken or injured, then, and as often as the same shall happen, the lessee shall immediately, by writing, notify the lessor, and at the same time explain the circumstances under which the same has happened. In case any such indicator ceases to indicate, or becomes or remains inaccurate, or the glass covering becomes or remains removed, broken, or injured, because of any fault of the lessee or anyone in his employ, or because of the failure of the lessee to give promptly the notice hereinbefore provided for, then, without prejudice to any other rights or remedies of the lessor, the lessee shall pay the lessor, without the right to any discount, eight cents per pair for each pair of boots, shoes or other footwear, or portions thereof, in the manufacture of which the leased machinery or any part thereof shall have been used. The lessee shall keep full and accurate accounts, independently of any indicators that may be placed upon the leased machinery, showing the number and kind of boots, shoes and other footwear or portions thereof manufactured or prepared by or for the lessee which have been welted in whole or in part or the soles of which have been in whole or in part attached to welts by the use of welting or stitching or sewing machinery, and of turned boots, shoes or other footwear or portions thereof manufac-

tured or prepared by or for the lessee, the soles of which have been sewed or attached to their uppers in whole or in part by the use of sewing or stitching machinery, and shall allow the lessor at all times, by its agents or attorneys, to examine and to take copies of such accounts and entries of the lessee as may serve to determine the total number of such boots, shoes or other footwear, or portions thereof; and the lessee shall produce all such accounts and entries upon request. The lessee shall require each of his operators upon the leased machinery or any part thereof to keep upon blanks or blank books to be furnished by the lessor accurate daily records of the number and kind of boots, shoes, and other footwear, or portions thereof, in the manufacture or preparation of which he has used the leased machinery or any part thereof, and shall require his operators to sign such records, and if requested so to do by the lessor, shall verify the same under oath. The lessee shall send to the office of the lessor in Boston, on or before the fifth day of each calendar month, the original records for the next preceding calendar month kept by his operators as above provided for and in case, in any calendar month, any one or more of the machines hereby leased has been entirely idle, the lessee on or before the fifth day of the next succeeding calendar month shall send to the office of the lessor in Boston the blank for said month for each such idle machine marked "not in use" and signed by the lessee. The lessee shall also furnish any further information which may be called for in relation to the leased machinery or the use thereof.

And that the following stipulations and provisions are agreed to: —

Eight. If, at any time, the lessee shall fail or cease to use exclusively welt sewing and outsole stitching machinery held by him under lease from the lessor in the manufacture of all welted boots, shoes or other footwear made by or for him, the welts or soles of which are sewed, stitched or attached by the aid of machinery, or shall fail or cease to use exclusively turn sewing machinery held by him under lease from the lessor in the manufacture of all turned boots, shoes or other footwear made by or for him, the soles of which are sewed or attached by the aid of machinery, the lessor,

although it may have waived or ignored prior instances of such failure or cessation, may at its option terminate forthwith by notice in writing any or all leases of or licenses to use "Goodyear Department" machinery then existing between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, and the possession of and full right to and control of all machinery the lease or license of which is so terminated, shall thereupon revest in the lessor free from all claims and demands whatsoever.

Nine. The term of this agreement shall be seventeen years from the date hereof. The lease of the leased machinery and license to use the same hereby granted shall continue, unless sooner terminated by the lessor, as in this agreement provided, for the full term of this agreement, but, if any breach or default shall be made in the observance of any one or more of the conditions in this agreement contained or contained in any other lease or license agreement subsisting between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise and expressed to be obligatory upon the lessee, the lessor shall have the right, by notice in writing to the lessee, to terminate forthwith any or all leases of or licenses to use machinery then in force between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, and this notwithstanding that previous breaches or defaults may have been unnoticed, waived or condoned by or on behalf of the lessor. If, upon the expiration of the full term of this agreement, the lessor does not request the return of the leased machinery, then the leased machinery shall continue to be held and used under and in accordance with the conditions, stipulations and provisions in this agreement contained and this agreement and the lease and license herein contained shall thereupon be extended indefinitely as to term; but thereafter either the lessee or the lessor, upon sixty days' notice in writing to the other, may terminate this agreement and the lease and license herein contained, whereupon the leased machinery shall be delivered forthwith to the lessor, as hereinafter provided. Upon the expiration or termination of this agreement or any extension thereof or of the lease and license

herein contained, the lessee shall forthwith deliver the leased machinery to the lessor at Beverly, Massachusetts, in good order, reasonable wear and tear alone excepted, and shall thereupon pay to the lessor without prejudice to any other rights or remedies of the lessor such sum as may be necessary to put the leased machinery in suitable order and condition to lease to another lessee. The lessee for himself, his heirs, executors, and administrators, successors and assigns, hereby grants to the lessor, its successors and assigns, full right, power, and authority upon such expiration or termination and without prejudice to any other rights or remedies of the lessor to enter upon the premises and into any factory, room, or any place where the leased machinery or any part thereof may be, and take possession thereof, and take away the same; and in no case shall the lessee have any claim for the repayment or offset of any sum or sums, or any part thereof, which shall have been paid under this agreement or in respect to the lease and license herein contained or in anywise in respect to the leased machinery.

Ten. Upon the expiration or termination of this agreement, or any extension thereof, or of the lease and license hereby granted, the lessee, in addition to all other payments in this agreement provided for and without prejudice to any other rights or remedies of the lessor, shall pay to the lessor in respect to each welting or stitching or sewing machine hereby leased the sum of One Hundred and Fifty (150) Dollars as partial reimbursement to the lessor for deterioration of the leased machinery, expenses in connection with the installation thereof and instruction of operators.

Eleven. A notice in writing, signed by the president, a vice-president, the treasurer or the assistant treasurer of the lessor, or by any assignee of the lessor's rights hereunder, and posted by prepaid letter, addressed to the lessee or delivered at his usual or last known place of abode or business, that the lease and license hereby granted is terminated or shall be terminated at the expiration of a certain period, shall be a sufficient termination of the lease and license from the time of posting or delivering such notice, or from the expiration of the period therein mentioned, as the case may be. Any termination of this agreement or of the lease and license

hereby granted shall be without prejudice to any rights or remedies which the lessor may have for violation of contract, use of machines without right, use of patented inventions without license or otherwise.

Twelve. The lessee admits the validity for the full term expressed in the grant thereof (and every extension and renewal thereof) of each and every of the Letters Patent of the United States of America owned by the lessor or under which it is licensed, any of the inventions of which are or hereafter may be embodied in the leased machinery, and the validity of and title of the lessor to the exclusive ownership of the trade names or trade marks "Goodyear Welt" and "Goodyear Turn," used in connection with boots, shoes and other footwear. The lessee also agrees that he will not directly or indirectly infringe or contest the validity for the full term expressed in the grant thereof, or of any extension or renewal thereof, of any of the Letters Patent referred to in the "Schedule of Patents" hereto annexed or the title of the lessor thereto and that he will not directly or indirectly infringe or contest the validity of or the title of the lessor to the said trade names or trade marks "Goodyear Welt" or "Goodyear Turn." The expiration or termination of this agreement or any extension thereof or the termination or cesser of the lease and license hereby granted shall not in any way affect the provisions of this clause, or release or discharge the lessee from the admissions and estoppels herein set forth.

Thirteen. None of the conditions, stipulations or provisions of this agreement shall be held to have been waived by any act or knowledge of the lessor, its agents or employees, but only by an instrument in writing, signed by the president, a vice-president, or the treasurer of the lessor.

Fourteen. The term "lessor" shall include the said United Shoe Machinery Company and its successors and assigns. All the conditions, stipulations and provisions binding on the lessee shall be binding on and enforceable against his legal representatives. In the construction of this instrument, words relating to the number and gender of the parties shall be read according to their real number and gender.

In witness whereof, the parties hereto have duly executed this instrument in duplicate, the day and year first above written.

Lease and License Agreement Number .

AUXILIARY MACHINES.

This Agreement made this day of 19 , between the United Shoe Machinery Company, a corporation organized under the laws of the State of New Jersey, hereinafter referred to as the lessor, of the one part, and of in the State of , hereinafter referred to as the lessee, of the other part:

Witnesseth that Whereas the lessee now holds under lease from the lessor one or more of the machines of the "Goodyear Department" of the lessor designated by name as follows, viz.: — Goodyear Welt and Turn Shoe Machine, Goodyear Universal Inseam Sewing Machine, Goodyear Outsole Rapid Lockstitch Machine;

And Whereas the lessee has requested the lessor to lease to the lessee and to grant to the lessee a license under the patents of the lessor to use the "Auxiliary Machinery" of the "Goodyear Department" of the lessor hereinafter specified, upon the terms and conditions hereinafter set forth,

Now, Therefore, the lessor, in consideration of the covenants and agreements on the part of the lessee herein contained, does hereby lease to and license the lessee under any letters patent belonging to the lessor or under which the lessor has the right to grant such license affecting any inventions which are now or hereafter shall be embodied therein or employed in the operation thereof to use the auxiliary machine or machines of the "Goodyear Department" of

the lessor designated by number or numbers in the following schedule, viz.: —

SCHEDULE OF AUXILIARY MACHINES.

	I.	II.
Goodyear Bobbin Winding Machine (Rapid), No.	$20.	$1.
Goodyear Bobbin Winding Machine (Universal)	20.	1.
Goodyear Welt Grooving and Beveling Machine, No.	15.	1.

Goodyear Welt Indenting and Burnishing Machine, No.	30.	3.

and any duplicate parts, extras, mechanisms and devices relating thereto, or used in connection therewith, now attached to or delivered with the said designated machine or machines, or which may at any time hereafter be obtained from the lessor, or be added

thereto by or with the consent of the lessor (the whole of which machine or machines, duplicate parts, extras, mechanisms and devices, held by the lessee under these presents, whether now or hereafter delivered to or in the possession of the lessee, is hereinafter referred to as the "leased machinery"), subject to the conditions hereinafter contained.

And that the following are agreed to as conditions of this agreement, all of which the lessee covenants and agrees to keep and perform: —

One. The leased machinery shall at all times remain and be the sole and exclusive property of the lessor, and the lessee shall have no right of property therein, but only the right to use the same, upon the conditions herein contained. The leased machinery shall be used only by the lessee himself or by operatives in his direct employ, and only in the factory now occupied by him at in the State of , unless the lessor shall by an instrument in writing, signed by its president, vice-president or treasurer, authorize the lessee to remove the leased machinery and to use the same elsewhere. The leased machinery shall not be transferred or delivered or sublet to any other person or corporation, and neither this agreement nor the lease nor the license hereby granted can be assigned by the lessee by his own act or by operation of law. If the lessee becomes insolvent or bankrupt, or has a receiving order made against him, or makes or executes any bill of sale, deed of trust or assignment for the benefit of his creditors, or if a sale, mortgage, lease or unauthorized removal of the leased machinery, or any part thereof be made or attempted, or if any distress or execution or attachment be levied thereon, then and in each such case any or all leases of or licenses to use machinery then existing between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, shall at the option of the lessor cease and determine, and the possession of and full right to and control of all machinery the leases or licenses of which are so terminated, shall thereupon revest in the lessor free from all claims and demands whatsoever. The lessor and its agents and employees shall at all times be given access to the leased machin-

ery for the purpose of inspecting it or watching its use and operation, or of altering, repairing, improving, or adding to it, or determining the nature or extent of its use, and the lessee shall afford all reasonable facilities therefor.

Two. The lessee shall at all times and at his own expense keep the leased machinery in good and efficient working order and condition, and shall not permit any one to injure or deface or remove any plate, or dates, numbers, or other inscriptions now or hereafter impressed on or affixed to the leased machinery by the lessor. The lessor shall obtain from the lessor exclusively, and shall pay therefor at the regular prices from time to time established by the lessor, all the duplicate parts, extras, mechanisms and devices, of every kind needed or used in operating, repairing, or renewing the leased machinery, and the same shall form part of the leased machinery, and the lessee shall not otherwise make or allow to be made any addition, subtraction or alteration to, from, or in the leased machinery nor interfere with the proper operation of the same.

Three. The leased machinery shall at all times, until the expiration or termination of the lease thereof and license to use the same hereby granted and the re-delivery of the leased machinery into the possession of the lessor as hereinafter provided, be held at the sole risk of the lessee from injury, loss or destruction, and in case any machine or machines hereby leased shall be lost or destroyed by fire or otherwise before such expiration or termination and re-delivery, the lessee shall pay to the lessor in respect to each machine so lost or destroyed as partial reimbursement to the lessor for such loss or destruction the amount set opposite the name of such machine in the column numbered "L" in the Schedule of Machines hereinbefore contained, and the lessee shall forthwith return whatever remains of the machinery so lost or destroyed to the lessor at Beverly, Massachusetts.

Four. The lessee shall pay all taxes and assessments which shall be assessed in respect to the leased machinery or other machinery of the lessor held by the lessee under lease or license upon whomsoever assessed. All taxes or assessments in respect to leases,

licenses or agreements covering machinery, or the rights to payments thereunder, shall be construed, for the purposes of this article, to be assessed in respect to the machinery itself. In case at any time any unapportioned tax or assessment shall be assessed to the lessor in respect in part but not wholly to machinery of the lessor in the possession of the lessee the lessee shall pay to the lessor such proportionate part of the total amount of said unapportioned tax or assessment, as the fair valuation, to be determined by the lessor, of said machinery of the lessor in the possession of the lessee bears to the fair valuation, to be determined by the lessor, of all machinery (excepting machinery, if any, in the lessor's own possession) in respect to which the unapportioned tax or assessment has been assessed: provided, however, that if such unapportioned tax or assessment includes any tax or assessment in respect to tangible property in the lessor's own possession the amount thereof, based, at the established rate, upon the fair valuation, to be determined by the lessor, of such property, shall first be deducted and the lessee shall pay his proportionate part as aforesaid of the balance only of said unapportioned tax or assessment after such deduction has been made.

Five. The leased machinery shall be used only in the manufacture of boots, shoes and other footwear made by the lessee known in the trade as "Goodyear Welts" which have been or are to be welted wholly by Goodyear Welt and Turn Shoe Machines or Goodyear Universal Inseam Sewing Machines held by the lessee under lease from the lessor, and the soles of which have been or are to be attached to their welts wholly by Goodyear Outsole Rapid Lockstitch Machines held by the lessee under lease from the lessor or in the manufacture of boots, shoes or other footwear made by the lessee known in the trade as "Goodyear Turns" the soles of which have been or are to be attached to their uppers wholly by Goodyear Welt and Turn Shoe Machines or Goodyear Universal Inseam Sewing Machines held by the lessee under lease from the lessor. The lessee shall not represent or sell as "Goodyear Welts" any boots, shoes or other footwear which are not welted wholly by the use of Goodyear Welt and Turn Shoe Machines or Goodyear Universal

Inseam Sewing Machines held under lease from the lessor or the soles of which are not attached to their welts wholly by the use of Goodyear Outsole Rapid Lockstitch Machines held under lease from the lessor, or as "Goodyear Turns" any boots, shoes or other footwear the soles of which are not attached to their uppers wholly by the use of Goodyear Welt and Turn Shoe Machines or Goodyear Universal Inseam Sewing Machines held under lease from the lessor.

Six. The lessee shall pay to the lessor throughout the full term of this agreement the respective amounts set forth in the following schedule in respect to each pair of welted boots, shoes or other footwear, or portions thereof, manufactured or prepared by or for the lessee, which shall have been welted in whole or in part or the soles of which shall have been in whole or in part attached to welts by the use of any welting or stitching or sewing machinery, and in respect to each pair of turned boots, shoes or other footwear, or portions thereof, manufactured or prepared by or for the lessee, the soles of which shall have been sewed or attached to their uppers in whole or in part by the use of any sewing or stitching machinery, viz. : —

SCHEDULE OF PAYMENTS (PER PAIR).

	Sizes. From No.	To No.	Welts.	Turns.
Children's	1	10½ inclusive.	3 cents.	1 cent.
Misses'	11	2 "	4 "	1½ cents.
Women's	2½	and over.	6 "	1½ "
Youths'	9	13½ inclusive.	4 "	1½ "
Boys'	1	5 "	6 "	1½ "
Men's	5½	and over.	8 "	1½ "

Such payments shall be made on the last day of each calendar month in respect to all such boots, shoes and other footwear manufactured or prepared by or for the lessee during the next preceding calendar month, **provided, however, that in all cases when the lessee shall pay to the lessor on or before the fifteenth day of the calendar month the amount due pursuant to the Schedule in this Article hereof contained for the next preceding calendar month, the lessor will in consideration of such prompt payment grant a**

discount of fifty per cent. from the amount so due for such preceding calendar month. All payments in this agreement provided for are independent of and in addition to all payments provided for in any other leases or licenses or agreements between the lessor and the lessee, provided, however, that in case under any other "Goodyear Department" lease and license agreement between the lessor and the lessee and covering one or more Goodyear Welt and Turn Shoe Machines, Goodyear Universal Inseam Sewing Machines or Goodyear Outsole Rapid Lockstitch Machines the lessee shall have paid to the lessor the amount set forth in the Schedule of Payments in such lease and license agreement contained in respect to any pair of boots, shoes or other footwear, then the lessee shall be relieved from said payment hereunder in respect to that pair of boots, shoes or other footwear.

Seven. Independently of and in addition to all other payments to be made by the lessee, the lessee shall annually throughout the full term of this agreement pay to the lessor, in respect to each machine hereby leased, the amount set opposite the name of such machine in the column numbered "II." in the Schedule of Machines hereinbefore contained. Such annual payment shall be made in advance on the first day of January in each year, excepting that the first of such payments shall be made on the day of the date of this agreement and shall be such proportion of said respective sum or sums as the unexpired portion of this calendar year bears to the entire year.

Eight. The lessor may attach to the leased machinery, or any thereof, an indicator or indicators to register the number of revolutions or movements of any part or parts thereof, and the lessee shall not allow any person (other than the lessor or its agents) to disturb or interfere with such indicator or indicators. In case any indicator thus attached shall from any cause cease to correctly indicate or register, or shall be disturbed or out of repair, or if the glass covering any such indicator shall be removed or broken or injured, then and as often as the same shall happen the lessee shall immediately by writing notify the lessor and at the same time explain the circumstances under which the same has happened. In

case any such indicator ceases to indicate, or becomes or remains inaccurate, or the glass covering becomes or remains removed, broken, or injured, because of any fault of the lessee or any one in his employ, or because of the failure of the lessee to give promptly the notice hereinbefore provided for, then, without prejudice to any other rights or remedies of the lessor, the lessee shall pay the lessor, without the right to any discount, eight cents per pair for each pair of boots, shoes or other footwear, or portions thereof, in the manufacture of which the leased machinery or any part thereof shall have been used. The lessee shall keep full and accurate accounts, independently of any indicators that may be placed upon the leased machinery, showing the number and kind of boots, shoes and other footwear or portions thereof manufactured or prepared by or for the lessee which have been welted in whole or in part or the soles of which have been in whole or in part attached to welts by the use of welting or stitching or sewing machinery, and of turned boots, shoes or other footwear or portions thereof manufactured or prepared by or for the lessee, the soles of which have been sewed or attached to their uppers in whole or in part by the use of sewing or stitching machinery, and shall allow the lessor at all times, by its agents or attorneys, to examine and to take copies of such accounts and entries of the lessee as may serve to determine the total number of such boots, shoes or other footwear, or portions thereof; and the lessee shall produce all such accounts and entries upon request. The lessee shall if so requested by the lessor at any time require each of his operators upon the leased machinery or any part thereof to keep upon blanks or blank books to be furnished by the lessor accurate daily records of the number and kind of boots, shoes and other footwear, or portions thereof, in the manufacture or preparation of which he has used the leased machinery or any part thereof, and shall require his operators to sign such records, and, if requested so to do by the lessor, shall verify the same under oath. The lessee shall send to the office of the lessor in Boston, on or before the fifth day of each calendar month, the original records for the next preceding calendar month kept by his operators as above provided for and in case, in any

calendar month, any one or more of the machines hereby leased has been entirely idle, the lessee on or before the fifth day of the next succeeding calendar month shall send to the office of the lessor in Boston the blank for said month for each such idle machine marked "not in use" and signed by the lessee. The lessee shall also furnish any further information which may be called for in relation to the leased machinery or the use thereof.

And that the following stipulations and provisions are agreed to: —

Nine. If, at any time, the lessee shall fail or cease to use exclusively welt sewing and outsole stitching machinery held by him under lease from the lessor in the manufacture of all welted boots, shoes, or other footwear made by or for him, the welts or soles of which are sewed, stitched or attached by the aid of machinery, or shall fail or cease to use exclusively turn sewing machinery held by him under lease from the lessor in the manufacture of all turned boots, shoes or other footwear made by or for him, the soles of which are sewed or attached by the aid of machinery, the lessor, although it may have waived or ignored prior instances of such failure or cessation, may at its option terminate forthwith by notice in writing any or all leases of or licenses to use "Goodyear Department" machinery, then existing between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, and the possession of and full right to and control of all machinery the lease or license of which is so terminated, shall thereupon revest in the lessor free from all claims and demands whatsoever.

Ten. The term of this agreement shall be seventeen years from the date hereof. The lease of the leased machinery and license to use the same hereby granted shall continue, unless sooner terminated by the lessor as in this agreement provided, for the full term of this agreement, but if any breach or default shall be made in the observance of any one or more of the conditions in this agreement contained or contained in any other lease or license agreement subsisting between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise and expressed to be obligatory upon the lessee, the lessor shall have the right by notice in writing

to the lessee to terminate forthwith any or all leases of or licenses to use machinery then in force between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, and this notwithstanding that previous breaches or defaults may have been unnoticed, waived, or condoned by or on behalf of the lessor. If, upon the expiration of the full term of this agreement, the lessor does not request the return of the leased machinery, then the leased machinery shall continue to be held and used under and in accordance with the conditions, stipulations and provisions in this agreement contained and this agreement and the lease and license herein contained shall thereupon be extended indefinitely as to term; but thereafter either the lessee or the lessor, upon sixty days' notice in writing to the other, may terminate this agreement and the lease and license herein contained, whereupon the leased machinery shall be delivered forthwith to the lessor, as hereinafter provided. Upon the expiration or termination of this agreement or any extension thereof or of the lease and license herein contained the lessee shall forthwith deliver the leased machinery to the lessor at Beverly, Massachusetts, in good order, reasonable wear and tear alone excepted, and shall thereupon pay to the lessor without prejudice to any other rights or remedies of the lessor such sum as may be necessary to put the leased machinery in suitable order and condition to lease to another lessee. The lessee for himself, his heirs, executors and administrators, successors and assigns, hereby grants to the lessor, its successors and assigns, full right, power and authority upon such expiration or termination and without prejudice to any other rights or remedies of the lessor to enter upon the premises and into any factory, room, or any place where the leased machinery, or any part thereof, may be, and take possession thereof, and take away the same; and in no case shall the lessee have any claim for the repayment or offset of any sum or sums or any part thereof which shall have been paid under this agreement or in respect to the lease or license herein contained or in anywise in respect to the leased machinery.

Eleven. Upon the expiration or termination of this agreement or any extension thereof or of the lease and license hereby granted

the lessee, in addition to all other payments in this agreement provided for and without prejudice to any other rights or remedies of the lessor, shall pay to the lessor as partial reimbursement to the lessor for deterioration of the leased machinery, expenses in connection with the installation thereof and instruction of operators, an amount in respect to each machine hereby leased equal to two-thirds of the sum set opposite the name of such machine in the column numbered "I." in the Schedule of Machines hereinbefore contained; provided, however, that in case the lease and license hereby granted shall continue throughout the full term of seventeen years hereinbefore provided for as the full term of this agreement and the lessee at the time of returning the leased machinery at the end of said full term shall not be in default as to any of the payments under or other conditions, stipulations or provisions of this or any other lease or license agreement between the lessor and the lessee, then the payment in this article hereof provided for shall not be required to be made.

Twelve. In case the lessee, at any time, shall have in his factory more machines adapted for doing the same work as any machine or machines hereby leased, than in the opinion of the lessor are sufficient for performing the work which the lessee has in his factory, based upon the capacity of such machines and the number and kind of boots, shoes and other footwear made by the lessee for any period of twelve (12) consecutive months next preceding, the lessor may, at its option, upon thirty (30) days' notice in writing to the lessee, terminate the lease and license herein contained in respect to such of the said machines as in the opinion of the lessor are unnecessary; but in the event that the lease and license hereby granted with respect to any machine or machines shall be thus terminated under the provisions of this Article and for no other reason whatsoever, then, provided the lessee is not at the time of such termination in default as to any of the payments under or other conditions, stipulations or provisions of this or any other lease or license agreement between the lessor and the lessee, neither the payment provided for in Article Eleven hereof in respect to such machine or machines nor any further payments under the provi-

sions of Article Seven hereof in respect to such machine or machines shall be required to be made. The termination under the provisions of this Article of the lease or of license to use any one or more of the machines hereby leased shall not affect the lease or license herein contained in respect to any other machine or machines.

Thirteen. In case at any time any of the leased machinery shall not, in the opinion of the lessor, be in good and efficient working order and condition, the lessor without prejudice to any other of its rights or remedies may give written notice to the lessee to put such machinery in good and efficient working order and condition and to replace all broken or missing parts; and in case the lessee does not within (15) days from the date of such notice comply with the requiremeats thereof, as herein set forth, the lessor may cause such machinery to be put in such good and efficient working order and condition, and may supply such broken or missing parts, and the lessee shall forthwith pay to the lessor the expense of making such repairs and the cost at the regular prices established by the lessor therefor of all parts so supplied.

Fourteen. A notice in writing, signed by the president, a vice-president, the treasurer or the assistant treasurer of the lessor or by any assignee of the lessor's rights hereunder, and posted by prepaid letter, addressed to the lessee or delivered at his usual or last known place of abode or business, that the lease and license hereby granted is terminated or shall be terminated at the expiration of a certain period, shall be a sufficient termination of the lease and license from the time of posting or delivering such notice, or from the expiration of the period therein mentioned, as the case may be. Any termination of this agreement or of the lease and license hereby granted shall be without prejudice to any rights or remedies which the lessor may have for violation of contract, use of machines without right, use of patented inventions without license or otherwise.

Fifteen. The lessee admits the validity for the full term expressed in the grant thereof (and every extension and renewal thereof) of each and every of the Letters Patent of the United States of Amer-

ica, owned by the lessor or under which it is licensed, any of the inventions of which are or hereafter may be embodied in the leased machinery, and the validity of and title of the lessor to the exclusive ownership of the trade names or trade marks "Goodyear Welt" and "Goodyear Turn," used in connection with boots, shoes and other footwear. The lessee also agrees that he will not directly or indirectly infringe or contest the validity for the full term expressed in the grant thereof or of any extension or renewal thereof, or any of the Letters Patent referred to in the "Schedule of Patents" hereto annexed or the title of the lessor thereto and that he will not directly or indirectly infringe or contest the validity of or the title of the lessor to the said trade names or trademarks "Goodyear Welt" or "Goodyear Turn." The expiration or termination of this agreement or any extension thereof or the termination or cesser of the lease and license hereby granted shall not in any way affect the provisions of this clause, or release or discharge the lessee from the admissions and estoppels herein set forth.

Sixteen. None of the conditions, stipulations or provisions of this agreement shall be held to have been waived by any act or knowledge of the lessor, its agents or employees, but only by an instrument in writing, signed by the president, a vice-president, or the treasurer of the lessor.

Seventeen. The term "lessor" shall include the said United Shoe Machinery Company and its successors and assigns. All the conditions, stipulations and provisions binding on the lessee shall be binding on and enforceable against his legal representatives. In the construction of this instrument, words relating to the number and gender of the parties shall be read according to their real number and gender.

In witness whereof, the parties hereto have duly executed this instrument in duplicate, the day and year first above written.

and any duplicate parts, extras, mechanisms and devices relating thereto, or used in connection therewith, now attached to or delivered with the said designated machine or machines, or which may at any time hereafter be obtained from the lessor, or be added thereto with the consent of the lessor (the whole of which machine or machines, duplicate parts, extras, mechanisms and devices, held by the lessee under these presents, whether now or hereafter delivered to or in the possession of the lessee, is hereinafter referred to as the "leased machinery"), subject to the conditions hereinafter contained.

And that the following are agreed to as conditions of the lease and license of the leased machinery, all of which the lessee covenants and agrees to keep and perform: —

One. The leased machinery shall at all times remain and be the sole and exclusive property of the lessor, and the lessee shall have no right of property therein but only the right to use the same, upon the conditions herein contained. The leased machinery shall be used only by the lessee himself, or by operatives in his direct employ, and only in the factory now occupied by him at in the State of . The leased machinery shall not be transferred or delivered or sublet to any other person or corporation, and neither the lease nor the license hereby granted can be assigned by the lessee by his own act or by operation of law. If the lessee becomes insolvent or bankrupt, or has a receiving order made against him, or makes or executes any bill of sale, deed of trust or assignment for the benefit of his creditors, or if a sale or lease or removal of the leased machinery, or any part thereof, without the consent in writing of the lessor, be made or attempted, or if any distress or execution or attachment be levied thereon, then and in each such

case this lease and license and any other lease or license then existing between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, shall at the option of the lessor cease and determine, and the possession of and full right to and control of all the leased machinery, and any machinery held by the lessee under any other lease or license from the lessor, whether as the result of assignment to the lessor or otherwise, shall thereupon revest in the lessor free from all claims or demands whatsoever. The lessor and its agents and employees shall at all times be given access to the leased machinery for the purpose of inspecting it or watching its use and operation, or of altering, repairing, improving, or adding to it, or determining the nature or extent of its use, and the lessee shall afford all reasonable facilities therefor.

Two. The lessee shall at all times and at his own expense keep the leased machinery in good and efficient working order and condition, and shall not permit anyone to injure or deface or remove any plate, or dates, numbers, or other inscriptions now or hereafter impressed on or affixed to the leased machinery by the lessor. The lessee shall obtain from the lessor exclusively, and shall pay therefor at the regular prices from time to time established by the lessor, all the duplicate parts, extras, mechanisms and devices, of every kind needed or used in operating, repairing, or renewing the leased machinery, and the same shall form part of the leased machinery, and the lessee shall not otherwise make or allow to be made any addition, subtraction or alteration to, from, or in the leased machinery without the consent in writing of the lessor, nor interfere with the proper operation of the same.

Three. The lessee shall pay all taxes and assessments which shall be assessed in respect to the leased machinery or other machinery of the lessor held by the lessee under lease or license upon whomsoever assessed. All taxes or assessments in respect to leases, licenses or agreements covering machinery, or the rights to payments thereunder, shall be construed, for the purposes of this article, to be assessed in respect to the machinery itself. In case at any time any unapportioned tax or assessment shall be assessed to the lessor in respect in part but not wholly to machinery of the

lessor in the possession of the lessee the lessee shall pay to the lessor such proportionate part of the total amount of said unapportioned tax or assessment as the fair valuation, to be determined by the lessor, of said machinery of the lessor in the possession of the lessee bears to the fair valuation, to be determined by the lessor, of all machinery (excepting machinery, if any, in the lessor's own possession) in respect to which the unapportioned tax or assessment has been assessed; provided, however, that if such unapportioned tax or assessment includes any tax or assessment in respect to tangible property in the lessor's own possession the amount thereof, based, at the established rate, upon the fair valuation, to be determined by the lessor, of such property, shall first be deducted and the lessee shall pay his proportionate part as aforesaid of the balance only of said unapportioned tax or assessment after such deduction has been made.

Four. The leased machinery shall be used only in the manufacture of boots, shoes and other footwear, known in the trade as "Goodyear Welts," which are or shall be welted and the soles stitched on welt sewing and stitching machines hereby, or by other instrument, heretofore or hereafter, leased to the lessee by the lessor or its assignor, or in the manufacture of boots, shoes or other footwear, known in the trade as "Goodyear Turns," the soles of which are or shall be attached to their uppers by turn sewing machines hereby, or by other instrument, heretofore or hereafter, leased to the lessee by the lessor or its assignor. The lessee shall use all Goodyear Welt and Turn Shoe Machines, Goodyear Universal Inseam Sewing Machines and Goodyear Outsole Rapid Lockstitch Machines hereby leased or held by him under other lease or license or agreement from the lessor, whether as the result of assignment to the lessor or otherwise, to their full capacity, limited only by the number of welted or turned boots, shoes and other footwear made by or for him.

Five. The lessee shall pay to the lessor immediately after the execution hereof, as a lease premium, the sum of Dollars and the lessee shall also pay to the lessor on the last day of each calendar month as rent or royalty the rental or royalty set forth in the

following schedule for each pair of boots, shoes or other footwear or portions thereof manufactured or prepared during the next preceding calendar month in any way, whether wholly or in part by the aid of the leased machinery or any part thereof: —

SCHEDULE OF RENTS AND ROYALTIES FOR GOODYEAR WELTS AND TURNS.

	Sizes. From No.	To. No.	Welts.	Turns.
Children's	1	10½ inclusive.	3 cents.	1 cent.
Misses'	11	2 "	4 "	1½ cents.
Women's	2½	and over.	6 "	1½ "
Youths'	9	13½ inclusive.	4 "	1½ "
Boys'	1	5 "	6 "	1½ "
Men's	5½	and over.	8 "	1½ "

provided, however, that in all cases when the lessee shall pay to the lessor on or before the fifteenth day of the calendar month the rent or royalty due for the use of the leased machinery for the next preceding calendar month, the lessor will, in consideration of such prompt payment, grant a discount of fifty per cent. from such rent or royalty due for such preceding calendar month.

Six. The lessor may attach to the leased machinery, or any thereof, an indicator or indicators to register the number of revolutions or movements of any part or parts thereof, and the lessee shall not allow any person (other than the lessor or its agents) to disturb or interfere with such indicator or indicators. In case any indicator thus attached shall from any cause cease to correctly indicate or register, or shall be disturbed or out of repair, or if the glass covering any such indicator shall be removed or broken or injured, then, and as often as the same shall happen the lessee shall immediately by writing notify the lessor, and at the same time explain the circumstances under which the same has happened. In case any such indicator ceases to indicate or becomes or remains inaccurate, or the glass covering becomes or remains removed, broken, or injured, because of any fault of the lessee or anyone in his employ, or because of the failure of the lessee to give promptly the notice hereinbefore provided for, then, without prejudice to

any other rights of the lessor hereunder, the lessee shall pay the lessor as rent or royalty, without the right to any discount, eight cents per pair for each pair of boots, shoes and other footwear, or portions thereof in the manufacture of which the leased machinery or any part thereof shall have been used. The lessee shall keep full and accurate accounts, independently of any indicators that may be placed upon the leased machinery, showing the number and kind of boots, shoes, and other footwear or portions thereof in the manufacture of which the leased machinery or any part thereof shall have been used, and shall allow the lessor at all times by its agents or attorneys, to examine and to take copies of such accounts and entries of the lessee as may serve to determine the total number of boots, shoes, or other footwear, or portions thereof, made by the aid of the leased machinery or any part thereof, and the lessee shall produce all such accounts and entries upon request. The lessee shall require each of his operators upon the leased machinery or any part thereof to keep, upon blanks or blank books to be furnished by the lessor, accurate daily records of the number and kind of boots, shoes, and other footwear, or portions thereof, in the making of which he has used the leased machinery or any part thereof, and shall require his operators to sign such records, and if requested so to do by the lessor, shall verify the same under oath and shall also furnish any further information called for by said blanks or blank-books; and the lessee shall send to the office of the lessor in Boston, on or before the fifth day of each calendar month, the original records for the next preceding calendar month kept by his operators as above provided for; and, in case in any calendar month, none of the leased machinery has been used, the lessee shall notify the lessor in writing of that fact, on or before the fifth day of the next succeeding calendar month.

And that the following agreements, stipulations and provisions are agreed to: —

Seven. If at any time the lessee shall fail or cease to use exclusively welt sewing and outsole stitching machinery held by him under lease from the lessor, in the manufacture of all "welted" boots, shoes, or other footwear made by or for him, the welts or

247

soles of which are sewed by the aid of machinery, or shall fail or cease to use exclusively turn sewing machinery held by him under lease from the lessor in the manufacture of all "turn" boots, shoes or other footwear, the soles of which are sewed by the aid of machinery, the lessor, although it may have waived or ignored prior instances of such failure or cessation, may at its option terminate forthwith by notice in writing this lease and license and any other lease or license of "Goodyear Department" machinery then existing between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise; and the possession of and full right to and control of all the leased machinery and all "Goodyear Department" machinery held by the lessee under lease or license from the lessor or its assignor shall thereupon revest in the lessor free from all claims and demands whatsoever.

Eight. This lease and license shall continue, unless sooner terminated by the lessor because of breach thereof on the part of the lessee, or otherwise as herein provided, for seventeen years from the date hereof. But if any breach or default shall be made in the observance of any one or more of the conditions herein contained or contained in any other lease or license agreement subsisting between the lessor and the lessee whether as the result of assignment to the lessor or otherwise and expressed to be obligatory upon the lessee, the lessor shall have the right, by notice in writing to the lessee to terminate forthwith this lease and license, and also if the lessor so elects any other lease or license agreements then in force between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, and this notwithstanding that previous breaches or defaults may have been unnoticed, waived, or condoned by or on behalf of the lessor. If, upon the expiration of the full term of this lease, the lessor does not request the return of the leased machinery, then the leased machinery shall continue to be held and used under and in accordance with the conditions of this lease and license, which shall thereupon be extended indefinitely as to term; but thereafter either the lessee or the lessor, upon sixty days' notice in writing to the other, may terminate this lease and license, whereupon the leased ma-

chinery shall be delivered forthwith to the lessor, as herein provided. Upon the expiration of this lease and license or any extension thereof or its termination by notice or by reason of any default on the part of the lessee as to the terms of this lease and license or any other lease or license from the lessor or otherwise in any manner whatsoever, the lessee shall forthwith deliver the leased machinery to the lessor at its office or factory in good order, reasonable wear and tear alone excepted; and the lessee for himself, his heirs, executors and administrators, hereby grants to the lessor, its successors and assigns, full right, power and authority to enter upon the premises and into any factory, room, or any place where the leased machinery, or any part thereof, may be, and take possession thereof, and take away the same; and the lessee shall have no claim for the repayment of any sum or sums, or any part thereof, which he shall have paid as consideration for the grant of this lease and license or for rent or royalty, or otherwise in respect to the leased machinery.

Nine. A notice in writing, signed by the president, a vice-president, the treasurer or the assistant treasurer of the lessor or by any assignee of the lessor's rights hereunder, and posted by prepaid letter, addressed to the lessee or delivered at his usual or last known place of abode or business, that the lease and license hereby granted is determined or shall be determined at the expiration of a certain period, shall be a sufficient determination of the lease and license from the time of posting or delivering such notice, or from the expiration of the period therein mentioned, as the case may be. Any termination of this lease and license shall not release the lessee from his obligation to pay rent or royalty for the period prior to such termination, and shall be without prejudice to any other rights or remedies which the lessor may have for violation of contract, use of machines without right, or use of patented inventions without license.

Ten. The lessee admits the validity for the full term expressed in the grant thereof (and every extension and renewal thereof) of each and every of the Letters Patent of the United States of America, owned by the lessor or under which it is licensed, any of

the inventions of which are or hereafter may be embodied in the leased machinery. The lessee also agrees that he will not directly or indirectly infringe or contest the validity for the full term expressed in the grant thereof or of any extension or renewal thereof, of any of the Letters Patent referred to in the "Schedule of Patents" hereto annexed or the title of the lessor thereto. The expiration of this agreement or any extension thereof or the termination or cesser of the lease and license hereby granted shall not in any way affect the provisions of this clause, or release or discharge the lessee from the admissions and estoppels herein set forth.

Eleven. None of the terms or conditions of this lease and license shall be held to have been waived by any act or knowledge of the lessor, its agents or employees, but only by an instrument in writing, signed by the president, a vice-president, the treasurer or the assistant treasurer of the lessor.

Twelve. The term "lessor" shall include the said United Shoe Machinery Company and its successors and assigns. All the conditions and agreements binding on the lessee shall be binding on and enforceable against his legal representatives. In the construction of this instrument, words relating to the number and gender of the parties shall be read according to their real number and gender.

In witness whereof, the parties hereto have duly executed this instrument in duplicate, the day and year first above written.

☞ If lessee is a corporation, add corporate seal.

SCHEDULE OF PATENTS.

[Put in Evidence, page 370.]

United States. Heeling Department. 100.

Lease and License Number *10*.

This Lease and Agreement made at Boston, in the State of Massachusetts, this *twenty-third* day of *April*, 1900, between the United Shoe Machinery Company, a corporation organized under the laws of the State of New Jersey, having an office in said Boston, hereinafter referred to as the lessor, of the one part, and *M. Felix and Company* of *Cincinnati, Ohio* hereinafter referred to as the lessee, of the other part:

Witnesseth, that the lessor, in consideration of the covenants and agreements on the part of the lessee herein contained, does hereby lease to and license the lessee under its patents to use the machine

or machines now or hereafter delivered to the lessee and designated by their number or numbers in the following schedule, viz.:—

McKay Heel Pricking Machine, No. *477*,
Bigelow Heel Compressing Machine, No.
McKay Heel Compressing and Loading Machine, No.
Fisher Compressing Machine, No.
Bresnahan Compressing Machine, No.
American Compressing Machine, No.
Columbia Compressing Machine, No.
Bigelow Heel Nailing Machine, No.
McKay Rapid Nailing Machine, No. *1651*,
McKay No. 2 Automatic Heel Nailing and Trimming Machine, No.
McKay Automatic Heel Loading and Attaching Machine, No.
American Lightning Nailing Machine, No.
Improved National Machine, No.
Columbia Nailing Machine, No.
McKay Heel Trimming and Randing Machine, No. *620*,
McKay Knife Grinding Machine, No. *396*,
McKay Rand Trimming Machine, No.
McKay Rand Trimming and Scouring Machine, No.
King Heel Trimming Machine, No.
Smith Heel Trimming Machine, No.
Bussel Heel Trimming Machine, No.
McKay Heel Breast Trimming Machine, No.
McKay Power Heel Breasting Machine, No.

and any parts, mechanisms, tools or devices relating thereto, or used in connection therewith, now attached to or delivered with the said designated machine or machines, or which may at any time hereafter be obtained from the lessor, or be added thereto with the consent of the lessor (the whole of which machine or machines, parts, mechanisms, tools or devices, held by the lessee under these presents, whether now or hereafter delivered to or in the possession of the lessee, is hereinafter referred to as "the said machinery"), subject to the conditions hereinafter contained.

And the following are agreed to as conditions of the lease and

license of the said machinery, all of which the lessee covenants and agrees to keep and perform : —

One. The said machinery shall be used only by the lessee himself, or by operatives in his direct employ, and only in the factory now occupied by him at *Cincinnati* in the State of *Ohio*. The said machinery shall not be transferred or delivered or sublet to another, and the lease or the license hereby granted cannot be assigned by the lessee by his own act or by operation of law. If the lessee becomes insolvent or bankrupt, or has a receiving order made against him, or makes or executes any deed of trust or assignment for the benefit of his creditors, or if a sale or lease or removal of said machinery, or any part thereof, without the consent in writing of the lessor, be made or attempted, or if any distress or execution or attachment be levied thereon, then and in each such case this lease and license and any other lease or license then existing between the lessor and the lessee shall at the option of the lessor cease and determine, and the possession and full right to and control of all the said machinery, and any machinery held by the lessee under any other lease or license from the lessor, shall thereupon revest in the lessor free from all claims or demands whatsoever. The said machinery shall at all times remain and be the sole and exclusive property of the lessor, and the lessee shall have no right of property therein but only the right to use the same, upon the conditions herein contained.

Two. The lessor and its agents and employees shall at all times have access to the said machinery for the purpose of inspecting it or watching its use and operation, or of altering, repairing, improving, or adding to it, or determining the nature or extent of its use, and the lessee shall afford all reasonable facilities therefor.

Three. The lessee shall at all times and at his own expense keep the said machinery in good and efficient working order and condition, and shall obtain from the lessor exclusively and shall pay therefor at the regular prices from time to time established by the lessor all the duplicate parts, extras, devices, and mechanisms of every kind needed or used in operating, repairing, or renewing the said machinery, and the lessee shall not otherwise make or allow

to be made any addition, subtraction or alteration to, from, or in the said machinery without the consent in writing of the lessor, nor interfere with the proper operation of the same. The lessee shall not permit anyone to injure or deface or remove any plate, or dates, numbers, or other inscriptions now or hereafter impressed on or affixed to the said machinery by the lessor. The lessee shall use the said machinery to its full capacity so far as the number and kind of boots and shoes made in his factory will permit, and in case the lessee has more work of the kind which can be performed by the said machinery than its capacity will permit, or has work in his factory which can be performed by any of the machines above named belonging to the Heeling Department of the lessor, then the lessee shall take from the lessor, under a like lease and agreement, sufficient additional machinery to perform the work. The lessee shall pay all taxes and assessments which may be levied in respect to the said machinery upon whomsoever assessed. The lessee shall at his own expense insure against loss by fire and keep insured to the full value thereof the said machinery, and in case of loss shall pay forthwith to the lessor a sum equal to the full amount of the loss occasioned to the lessor.

Four. The lessee shall pay to the lessor on the fifteenth day of each calendar month as rent or royalty the sum of one half a cent for each pair of boot or shoe heels or boots or shoes attached or trimmed or manufactured or prepared in any way, whether wholly or in part, by the aid or use of said machinery or any part thereof during the preceding calendar month, provided, however, that in all cases where the lessee shall pay the lessor on or before the fifteenth day of the calendar month the royalty due for boots or shoes made wholly or in part by the aid of said machinery or any part thereof, the lessor will in consideration of such prompt payment grant a discount of fifty per cent from the rent due for such preceding calendar month. As the said machinery is supplied to the lessee without cash payment covering the cost of manufacture, the lessee agrees that the abated royalty herein provided for shall not be less that *Two hundred thirty* dollars, during each calendar year embraced by this lease, excepting that a reduction from this guaranteed

amount of one twelfth of said amount shall be allowed at the end of the year for each calendar month during which the factory of the lessee has remained wholly idle, and for the same reason it is agreed that the lessor may at any time cancel this lease and license by giving sixty days' notice in writing of its intention so to do.

Five. The lessor may attach to the said machinery an indicator or indicators to register the number of movements of any part thereof, and the lessee shall not allow any person (other than the lessor or its agent) to disturb or interfere with such indicator. In case any indicator thus attached shall from any cause cease to correctly indicate or register, or shall be disturbed or out of repair, or if the glass covering the indicator shall be removed or broken or injured, then, and as often as the same shall happen, the lessee shall immediately, by writing, notify the lessor and at the same time explain the circumstances under which the same has happened. In case the indicator ceases to indicate, or becomes or remains inaccurate, or the glass covering becomes or remains removed, broken or injured because of any fault of the lessee or anyone in his employ, or because of the failure of the lessee to give promptly the notice hereinbefore provided for, then, without prejudice to any other rights of the lessor hereunder, the lessee shall pay the lessor as rent one cent per pair for each pair of boots or shoes or any part thereof in the manufacture of which the said machinery or any part thereof shall have been used. The lessee shall keep a full and accurate account, independently of any indicators that may be placed upon the said machinery, of all boots and shoes in the manufacture of which the said machinery or any part thereof shall be used, and shall allow the lessor and its agents to have access at all times to such accounts; and the lessee further agrees to require each of his operators upon the said machinery or any part thereof to keep upon blanks or blank books to be furnished by the lessor accurate daily records of the number of boots or shoes in the making of which the said machinery or any part thereof shall have been used, and to require his operators to furnish any further information called for by said blanks or blank books and to sign such daily records and to deliver them to the lessee, and the lessee agrees to

send to the office of the lessor, on the first day of each month, the original records for the preceding calendar month kept by his operators as above provided for.

Six. This lease and license shall continue, unless sooner terminated by the lessor by notice or because of breach thereof on the part of the lessee, or otherwise as herein provided, for seventeen years from the date hereof. If, upon the expiration of the full term of this lease, the lessor does not request the return of the said machinery, then the said machinery shall continue to be held and used under and in accordance with the conditions of this lease and license, which shall thereupon be extended indefinitely as to term; but thereafter either the lessee or the lessor, upon sixty days' notice in writing to the other, may terminate this lease and license, whereupon the said machinery shall be delivered forthwith to the lessor, as herein provided. But if any breach or default shall be made in the observance of any one or more of the conditions or agreements herein contained or contained in any other lease subsisting between the lessor and lessee, whether as the result of assignment to the lessor or otherwise, and expressed to be obligatory on the lessee, the lessor shall have the right, by notice in writing to the lessee to terminate forthwith this lease and license and also if the lessor so elects any other lease or license agreements then in force between the lessor and the lessee whether as the result of assignment to the lessor or otherwise, and this notwithstanding that previous breaches or defaults may have been unnoticed, waived, or condoned by or on behalf of the lessor, and in case this lease and license shall be terminated by reason of any default on the part of the lessee, as to the terms of this lease or any other lease with the lessor, the lessee, in addition and without prejudice to any other rights and remedies of the lessor hereunder, shall forthwith pay to the lessor such sum as may be necessary to put the said machinery in good order and condition.

Upon the termination of this lease and license before expiration for breach of condition or otherwise, or the expiration of the full term thereof, the lessee shall forthwith deliver the said machinery to the lessor at its office or factory; and the lessee for himself,

his heirs, executors and administrators, hereby grants to the lessor, its successors and assigns, full right, power and authority to enter upon the premises and into any factory, room, or any place where the said machinery, or any part thereof, may be, and take possession thereof, and take away the same.

Seven. A notice in writing, signed by the president, a vice-president, or the treasurer of the lessor or by the assignee of the lessor's rights hereunder and posted by pre-paid letter, addressed to the lessee or delivered at his usual or last known place of abode or business, that the lease and license hereby granted is determined or shall be determined at the expiration of a certain period, shall be a sufficient determination of the lease and license from the time of posting or delivering such notice, or from the expiration of the period therein mentioned, as the case may be. Any termination of this lease and license shall not release the lessee from his obligation to pay rent for the period prior to such termination, and shall be without prejudice to any other rights or remedies which the lessor may have for violation of contract, use of machines without right, or use of patents without license.

Eight. The lessee admits the validity of each and every of the letters patent of the United States owned by the lessor or under which it is licensed, any of the inventions of which are or hereafter may be embodied in the leased machinery, and agrees that he will not directly or indirectly infringe or contest the validity of, or the title of the lessor to, any of the patents; and that he shall be forever estopped from so doing. The termination or cesser of this lease and license from any cause whatever shall not in any way affect the provisions of this clause, or release or discharge the lessee from the admission and estoppel herein set forth.

Nine. None of the terms or conditions of this lease and license shall be held to have been waived by any act or knowledge of the lessor, its agents or employees, but only by an instrument in writing, signed by the president, a vice-president or the treasurer of the lessor.

Ten. The term "lessor" shall include the said United Shoe Machinery Company and its successors and assigns. All the con-

ditions and agreements binding on the lessee shall be binding on and enforceable against his legal representatives. In the construction of this instrument, words relating to the number and gender of the parties shall be read according to their real number and gender.

In Witness Whereof, the parties hereto have duly executed this instrument the day and year first above written.

Lease and License Number .

This Lease and Agreement made at Boston, in the State of Massachusetts this day of 19 , between the United Shoe Machinery Company, a corporation organized under the laws of the State of New Jersey, having an office in said Boston, hereinafter referred to as the lessor, of the one part, and of in the State of , hereinafter referred to as the lessee, of the other part:

Witnesseth, that the lessor, in consideration of the covenants and agreements on the part of the lessee herein contained, does hereby lease to and license the lessee under any letters patent belonging to the lessor or under which the lessor has the right to

grant such license affecting any inventions which are now or hereinafter shall be embodied therein or employed in the operation thereof, to use the machine or machines of the Heeling Machine Department of the lessor now or hereafter delivered to the lessee, and designated by number or numbers in the following schedule, viz: —

SCHEDULE OF MACHINES.

Automatic Heel Compressing Machine (No. 4, Model), No.
McKay Rapid Nailing Machine, No.
McKay Automatic Heel Loading and Attaching Machine, No.
American Lightning Nailing Machine, No.
Improved National Nailing Machine, No.
McKay Heel Trimming and Randing Machine, No.
McKay Knife Grinding Machine, No.
Smith Heel Trimming Machine, No.
Bussel Heel Trimming Machine, No.
Ultima Heel Trimming Machine, No.

and any duplicate parts, extras, mechanisms and devices relating thereto, or used in connection therewith, now attached to or delivered with the said designated machine or machines, or which may at any time hereafter be obtained from the lessor, or be added thereto by or with the consent of the lessor (the whole of which machine or machines, duplicate parts, extras, mechanisms and devices, held by the lessee under these presents, whether now or hereafter delivered to or in the possession of the lessee, is hereinafter referred to as the "leased machinery"), subject to the conditions hereinafter contained.

And that the following are agreed to as conditions of the lease and license of the leased machinery, all of which the lessee covenants and agrees to keep and perform: —

One. The leased machinery shall at all times remain and be the sole and exclusive property of the lessor, and the lessee shall have no right of property therein, but only the right to use the same, upon the conditions herein contained. The leased machinery shall be used only by the lessee himself or by operatives in his direct employ, and only in the factory now occupied by him at

in the State of . The leased machinery shall not be transferred or delivered or sublet to any other person or corporation, and neither the lease nor the license hereby granted can be assigned by the lessee by his own act or by operation of law. If the lessee becomes insolvent or bankrupt, or has a receiving order made against him, or makes or executes any bill of sale, deed of trust or assignment for the benefit of his creditors, or if a sale, mortgage, lease or removal of the leased machinery, or any part thereof, be made or attempted, or if any distress or execution or attachment be levied thereon, then and in each such case any or all leases of or licenses to use machinery then existing between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, shall at the option of the lessor cease and determine, and the possession of and full right to and control of all machinery the leases or licenses of which are so terminated shall thereupon revest in the lessor free from all claims or demands whatsoever. The lessor and its agents and employees shall at all times be given access to the leased machinery for the purpose of inspecting it or watching its use and operation, or of altering, repairing, improving, or adding to it, or determining the nature or extent of its use, and the lessee shall afford all reasonable facilities therefor.

Two. The lessee shall at all times and at his own expense keep the leased machinery in good and efficient working order and condition, and shall not permit any one to injure or deface or remove any plate, or dates, numbers, or other inscriptions now or hereafter impressed on or affixed to the leased machinery by the lessor. The lessee shall obtain from the lessor exclusively, and shall pay therefor at the regular prices from time to time established by the lessor, all the duplicate parts, extras, mechanisms and devices of every kind needed or used in operating, repairing or renewing the leased machinery, and the same shall form part of the leased machinery, and the lessee shall not otherwise make or allow to be made any addition, subtraction, or alteration to, from, or in the leased machinery without the consent in writing of the lessor, nor interfere with the proper operation of the same.

Three. The leased machinery shall at all times, until the expira-

tion or termination of the lease thereof and license to use the same hereby granted and the re-delivery of the leased machinery into the possession of the lessor as hereinafter provided, be held at the sole risk of the lessee from injury, loss or destruction, and in case the same shall be lost or destroyed by fire or otherwise before such expiration or termination and re-delivery, the lessee shall pay to the lessor as partial reimbursement to the lessor for such loss or destruction the agreed sum of dollars and the lessee shall forthwith return whatever remains of the machinery so lost or destroyed to the lessor at Beverly, Massachusetts.

Four. The lessee shall pay all taxes and assessments which shall be assessed in respect to the leased machinery or other machinery of the lessor held by the lessee under lease or license upon whomsoever assessed. All taxes or assessments in respect to leases, licenses or agreements covering machinery, or the rights to payments thereunder, shall be construed, for the purposes of this article, to be assessed in respect to the machinery itself. In case at any time any unapportioned tax or assessment shall be assessed to the lessor in respect in part but not wholly to machinery of the lessor in the possession of the lessee the lessee shall pay to the lessor such proportionate part of the total amount of said unapportioned tax or assessment as the fair valuation, to be determined by the lessor, of said machinery of the lessor in the possession of the lessee bears to the fair valuation, to be determined by the lessor, of all machinery (excepting machinery, if any, in the lessor's own possession) in respect to which the unapportioned tax or assessment has been assessed; provided, however, that if such unapportioned tax or assessment includes any tax or assessment in respect to tangible property in the lessor's own possession the amount thereof, based, at the established rate, upon the fair valuation, to be determined by the lessor, of such property, shall first be deducted and the lessee shall pay his proportionate part as aforesaid of the balance only of said unapportioned tax or assessment after such deduction has been made.

Five. The lessee shall use the leased machinery to its full capacity for doing all work in manufacturing, preparing and

attaching all heels and top-lifts and in manufacturing and preparing all soles and taps made or prepared or attached in his factory in the manufacture or preparation or attaching of which it can be used, and the leased machinery shall be used for no other purpose. The leased machinery shall not however nor shall any part thereof be used for manufacturing, preparing or attaching heels, top-lifts, soles or taps for any boots, shoes or other footwear which have been or shall be welted or the soles stitched by the aid of any welt sewing or sole stitching machinery not held by the lessee under lease from the lessor, or for any turn boots, shoes or other footwear the soles of which have been or shall be attached by the aid of any turn sewing machinery not held by the lessee under lease from the lessor, or for any boots, shoes or other footwear which have been or shall be lasted, pegged, slugged, heel seat nailed or otherwise partly made by the aid of any lasting, pegging or metallic machinery not held by the lessee under lease from the lessor.

Six. The lessee shall pay to the lessor on the last day of each calendar month as rent or royalty the sum of one-half of one cent for each pair of heels manufactured or prepared or attached during the next preceding calendar month in any way, whether wholly or in part, by the aid of the leased machinery or any part thereof; **provided, however, that in all cases when the lessee shall pay to the lessor on or before the fifteenth day of the calendar month the rent or royalty due for the use of the leased machinery for the next preceding calendar month the lessor will in consideration of such prompt payment grant a discount of fifty per cent. from such rent or royalty due for such preceding calendar month.**

Seven. In case any Compressing Machine (or Machines) hereby leased shall be used for compressing or otherwise operating upon top-lifts, soles or taps the lessee shall pay to the lessor independently of and in addition to the rental or royalty provided for in Article Six hereof a rental or royalty of one-quarter of one cent for each pair of top-lifts, soles or taps so compressed or operated upon. Such royalty shall be paid at the same time and in the same manner as the royalty provided for in said Article Six and

shall be subject to discount for prompt cash payment, as in said Article Six provided.

Eight. The lessee guarantees that the rent or royalty herein provided (less all abatements) shall amount to at least dollars during each year embraced by this lease and at the end of each year the lessee shall pay to the lessor the amount, if any, by which the rent or royalty paid for said year is less than such guaranteed rent or royalty; provided, however, that if in any year the factory of the lessee remains wholly idle for any entire calendar month, then the amount of rent or royalty guaranteed for that year shall be reduced by one-twelfth for each such month that the factory thus remains wholly idle.

Nine. The lessor may attach to the leased machinery, or any thereof, an indicator or indicators to register the number of revolutions or movements of any part or parts thereof, and the lessee shall not allow any person (other than the lessor or its agents) to disturb or interfere with such indicator or indicators. In case any indicator thus attached shall from any cause cease to correctly indicate or register, or shall be disturbed or out of repair, or if the glass covering any such indicator shall be removed or broken or injured, then, and as often as the same shall happen, the lessee shall immediately, by writing, notify the lessor, and at the same time explain the circumstances under which the same has happened. In case any such indicator ceases to indicate, or becomes or remains inaccurate, or the glass covering becomes or remains removed, broken, or injured, because of any fault of the lessee or any one in his employ, or because of the failure of the lessee to give promptly the notice hereinbefore provided for, then, without prejudice to any other rights of the lessor hereunder, the lessee shall pay the lessor as rent or royalty, without the right to any discount, one-half of one cent per pair for each pair of heels, top-lifts, soles or taps, in the manufacture or preparation or attaching of which the leased machinery or any part thereof shall have been used. The lessee shall keep full and accurate accounts, independently of any indicators that may be placed upon the leased machinery, showing the number of heels, top-lifts, soles and taps, in the manufac-

ture or preparation or attaching of which the leased machinery, or any part thereof, shall have been used, and shall allow the lessor at all times, by its agents or attorneys, to examine and to take copies of such accounts and entries of the lessee as may serve to determine the total number of such heels, top-lifts, soles and taps and the lessee shall produce all such accounts and entries upon request. The lessee shall require each of his operators upon the leased machinery, or any part thereof to keep upon blanks or blank books to be furnished by the lessor, accurate daily records of the number of heels, top-lifts, soles or taps, in the manufacture or preparation or attaching of which he has used the leased machinery or any part thereof, and shall require his operators to sign such records, and, if requested so to do by the lessor, shall verify the same under oath. The lessee shall send to the office of the lessor in Boston, on or before the fifth day of each calendar month, the original records for the next preceding calendar month kept by his operators as above provided for; and in case, in any calendar month, none of the leased machinery has been used, the lessee shall notify the lessor in writing of that fact, on or before the fifth day of the next succeeding calendar month. The lessee shall also furnish any further information which may be called for in relation to the leased machinery or the use thereof.

And that the following agreements, stipulations, and provisions are agreed to:—

Ten. If at any time the lessee shall fail or cease to use exclusively machinery held by him under lease from the lessor, for doing all machine work done by or for him of a kind for which any of the machines mentioned by name in the foregoing Schedule of Machines is capable of being used, the lessor, although it may have waived or ignored prior instances of such failure or cessation, may at its option terminate forthwith by notice in writing any or all leases of or licenses to use machinery of any or all the kinds mentioned by name in said schedule then existing between the lessor and the lessee (whether as the result of assignment to the lessor or otherwise) and the possession of and full right to and control of all machinery, the lease of which of is so terminated, shall there-

upon revest in the lessor, free from all claims and demands whatsoever.

Eleven. This lease and license shall continue, unless sooner terminated by the lessor because of breach thereof on the part of the lessee, or otherwise as herein provided, for seventeen years from the date hereof. But if any breach or default shall be be made in the observance of any one or more of the conditions herein contained or contained in any other lease or license agreement subsisting between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise and expressed to be obligatory upon the lessee, the lessor shall have the right by notice in writing to the lessee to terminate forthwith any or all leases of or licenses to use machinery then in force between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, and this notwithstanding that previous breaches or defaults may have been unnoticed, waived, or condoned by or on behalf of the lessor. If, upon the expiration of the full term of this lease, the lessor does not request the return of the leased machinery, then the leased machinery shall continue to be held and used under and in accordance with the conditions of this lease and license, which shall thereupon be extended indefinitely as to term; but thereafter either the lessee or the lessor, upon sixty days' notice in writing to the other, may terminate this lease and license, whereupon the leased machinery shall be delivered forthwith to the lessor, as herein provided. Upon the expiration of this lease and license or any extension thereof or its termination by notice or by reason of any default on the part of the lessee as to the terms of this lease and license or any other lease or license from the lessor, or otherwise in any manner whatsoever, the lessee shall forthwith deliver the leased machinery to the lessor at Beverly, Massachusetts, in good order, reasonable wear and tear alone excepted; and without prejudice to any other rights or remedies of the lessor hereunder, shall pay to the lessor upon demand such sum as may be necessary to put the leased machinery in suitable order and condition to lease to another lessee; and the lessee for himself, his heirs, executors and administrators, hereby grants to the lessor, its successors and

assigns, full right, power and authority to enter upon the premises and into any factory, room, or any place where the leased machinery, or any part thereof, may be, and take possession thereof, and take away the same.

Twelve. A notice in writing, signed by the president, a vice-president, the treasurer or the assistant treasurer of the lessor or by any assignee of the lessor's rights hereunder, and posted by prepaid letter, addressed to the lessee or delivered at his usual or last known place of abode or business, that the lease and license hereby granted is determined or shall be determined at the expiration of a certain period, shall be a sufficient determination of the lease and license from the time of posting or delivering such notice, or from the expiration of the period therein mentioned, as the case may be. Any termination of this lease and license shall not release the lessee from his obligation to pay rent or royalty for the period prior to such termination and shall be without prejudice to any other rights or remedies which the lessor may have for violation of contract, use of machines without right, or use of patented inventions without license.

Thirteen. The lessee admits the validity for the full term expressed in the grant thereof (and every extension and renewal thereof) of each and every of the Letters Patent of the United States of America, owned by the lessor or under which it is licensed, any of the inventions of which are or hereafter may be embodied in the leased machinery. The lessee also agrees that he will not directly or indirectly infringe or contest the validity for the full term expressed in the grant thereof or of any extension or renewal thereof, of any of the Letters Patent referred to in the Schedule of Patents hereto annexed or the title of the lessor thereto. The expiration of this agreement or any extension thereof or the termination or cesser of the lease and license hereby granted shall not in any way affect the provisions of this clause, or release or discharge the lessee from the admissions and estoppels herein set forth.

Fourteen. None of the terms or conditions of this lease and license shall be held to have been waived by any act or knowledge

of the lessor, its agents or employees, but only by an instrument in writing, signed by the president, a vice-president or the treasurer of the lessor.

Fifteen. The term "lessor" shall include the said United Shoe Machinery Company and its successors and assigns. All the conditions and agreements binding on the lessee shall be binding on and enforceable against his legal representatives. In the construction of this instrument, words relating to the number and gender of the parties shall be read according to their real number and gender.

In witness whereof, the parties hereto have duly executed this instrument in duplicate, the day and year first above written.

United States. Metallic Department. 300.

Lease and License Number *43*.

This Lease and Agreement made this *ninth* day of *April* 1900, between the United Shoe Machinery Company, a corporation organized under the laws of the State of New Jersey, hereinafter referred to as the lessor, of the one part, and *R. C. Dean* of *Cochituate, Massachusetts*, hereinafter referred to as the lessee, of the other part:

Witnesseth, that the lessor, in consideration of the covenants and agreements on the part of the lessee herein contained, does hereby lease to and license the lessee under its patents to use the machine or machines now or hereafter delivered to the lessee, and designated by their number in the following schedule, viz.: —

Rapid Standard Screw Machine, No.
Old Style Standard Screw Machine, No. ~~490~~,
Loose Nailing Machine, No.
Universal Slugging Machine, No.
Taper Nail Tacking Machine (D. H.), No.
Taper Nail Tacking Machine (S. H.), No.
Spring Nail Tacking Machine, No.
Power Welt Tacking Machine, No.
Cable Tacking Machine, No.

Universal Quilting Machine, No.
Circlet Driving Machine, No.
Grip Slugging Machine, No.
Grip Clinch Machine, No.
Grip Tacking Machine, No. ~~303~~,
Lewis Nailing Machine, No.
Spatter Quilting Machine, No.
Double Row Pegging Machine, No.
National Slugging Machine, No.
Simplex Slugging Machine, No.
Champion Heel Seat Nailing Machine, No.
Champion Slugging Machine, No.
Staple Fastening Machine, No.
Automatic Staple Nailing Machine, No.
Universal Double Clinch Machine, No.
Gordon Staple Tacking Machine, No.
Corrugated Wire Tacking Machine, No.

and any parts, mechanisms, tools or devices relating thereto, or used in connection therewith, now attached to or delivered with the said designated machine or machines, or which may at any time hereafter be obtained from the lessor or be added thereto with the consent of the lessor (the whole of which machine or machines, parts, mechanisms, tools or devices held by the lessee under these presents, whether now or hereafter delivered to or in the possession of the lessee, is hereinafter referred to as "the said machinery"), subject to the conditions hereinafter contained.

And the following are agreed to as conditions of the lease and license of the said machinery, all of which the lessee covenants and agrees to keep and perform: —

One. The said machinery shall be used only by the lessee himself, or by operatives in his direct employ, and only in the factory now occupied by him at *Cochituate* in the State of *Massachusetts*. The said machinery shall not be transferred or delivered or sublet to another, and the lease or the license hereby granted cannot be assigned by the lessee by his own act or by operation of law. If

the lessee becomes insolvent or bankrupt, or has a receiving order made against him, or makes or executes any deed of trust or assignment for the benefit of his creditors, or if a sale or lease or removal of said machinery, or any part thereof, without the consent in writing of the lessor, be made or attempted, or if any distress or execution or attachment be levied thereon, then and in each such case this lease and license and any other lease or license then existing between the lessor and the lessee, shall, at the option of the lessor, cease and determine, and the possession and full right to and control of all the said machinery, and any machinery held by the lessee under any other lease or license from the lessor, shall thereupon revest in the lessor free from all claims or demands whatsoever. The said machinery shall at all times remain and be the sole and exclusive property of the lessor, and the lessee shall have no right of property therein, but only the right to use the same, upon the conditions herein contained.

Two. The lessor, and its agents and employees, shall at all times have access to the said machinery for the purpose of inspecting it, or watching its use and operation, or of altering, repairing, improving, or adding to it, or determining the nature or extent of its use, and the lessee shall afford all reasonable facilities therefor.

Three. The lessee shall at all times and at his own expense keep the said machinery in good and efficient working order and condition, and shall obtain from the lessor exclusively, and shall pay therefor at the regular prices from time to time established by the lessor, all the duplicate parts, extras, devices, and mechanisms of every kind needed or used in operating, repairing, or renewing the said machinery, and the lessee shall not otherwise make or allow to be made any addition, subtraction, or alteration to, from, or in the said machinery without the consent in writing of the lessor, nor interfere with the proper operation of the same. The lessee shall not permit any one to injure or deface or remove any plate, or dates, numbers, or other inscriptions now or hereafter impressed on or affixed to the said machinery by the lessor. The lessee shall use the said machinery to its full capacity so far as the number and kind of boots and shoes made in his factory will per-

mit, and in case the lessee has more work of the kind which can be performed by the said machinery than its capacity will permit, or has work in his factory which can be performed by any of the machines above named belonging to the Metallic Department of the lessor, then the lessee shall take from the lessor, under a like lease and agreement, sufficient additional machinery to perform the work. The lessee shall pay all taxes and assessments which may be levied in respect to the said machinery upon whomsoever assessed. The lessee shall at his own expense insure against loss by fire and keep insured to the full value thereof the said machinery, and in case of loss shall pay forthwith to the lessor a sum equal to the full amount of the loss occasioned to the lessor.

Four. The lessee agrees, as rent or royalty for the said machinery, to purchase of the lessor at the prices established by the lessor, all the material or fastening used by him in or in connection with the said machinery, paying therefor in cash on delivery. As the said machinery is supplied to the lessee without cash payment covering the cost of manufacture, the lessee hereby guarantees that for each machine hereby leased the amount of material or fastening used by him and purchased from the lessor in accordance with the terms hereof shall not be less than four hundred pounds during each calendar year embraced by this lease, excepting that a reduction of thirty-three pounds from the amount thus guaranteed for each machine shall be allowed at the end of the year for each calendar month during which the factory of the lessee has remained wholly idle, and for the same reason it is agreed that the lessor may at any time cancel this lease and license by giving sixty days' notice in writing of its intention so to do.

Five. The lessor may attach to the said machinery an indicator or indicators to register the number of revolutions or movements of any part thereof, and the lessee shall not allow any person (other than the lessor or its agent) to disturb or interfere with such indicator. The lessee shall whenever requested by the lessor keep, or cause his operators to keep, independently of any indicators, full and accurate accounts showing the number of boots or shoes or parts thereof in the manufacture of which the said machinery or

any part thereof shall have been used, and shall, if requested by the lessor, send to the lessor on the fifth day of each calendar month such accounts or copies thereof covering the preceding calendar month, and shall verify such accounts by affidavit.

Six. This lease and license shall continue, unless sooner terminated by notice or because of breach thereof on the part of the lessee, or otherwise as herein provided, for seventeen years from the date hereof. If, upon the expiration of the full term of this lease, the lessor does not request the return of the said machinery, then the said machinery shall continue to be held and used under and in accordance with the conditions of this lease and license, which shall thereupon be extended indefinitely as to term; but thereafter either the lessee or the lessor, upon sixty days' notice in writing to the other, may terminate this lease and license, whereupon the said machinery shall be delivered forthwith to the lessor, as herein provided. But if any breach or default shall be made in the observance of any one or more of the conditions or agreements herein contained, or contained in any other lease subsisting between the lessor and lessee, whether as the result of assignment to the lessor or otherwise, and expressed to be obligatory on the lessee, the lessor shall have the right by notice in writing to the lessee to terminate forthwith this lease and license, and also if the lessor so elects any other lease and license agreements then in force between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise; and this notwithstanding that previous breaches or defaults may have been unnoticed, waived or condoned by or on behalf of the lessor. In case this lease and license shall be terminated by reason of any default on the part of the lessee, as to the terms of this lease or any other lease with the lessor, the lessee, in addition and without prejudice to any other rights and remedies of the lessor hereunder, shall forthwith pay to the lessor such sum as may be necessary to put the said machinery in good order and condition.

Upon the termination of this lease and license, before expiration for breach of condition or otherwise, or the expiration of the full term thereof, the lessee shall forthwith deliver the said machinery

to the lessor at its office or factory; and the lessee, for himself, his heirs, executors and administrators, hereby grants to the lessor, its successors and assigns, full right, power and authority to enter upon the premises and into any factory, room, or any place where the said machinery, or any part thereof, may be, and take possession thereof, and take away the same.

Seven. A notice in writing, signed by the president, a vice-president, or the treasurer of the lessor, or by the assignee of the lessor's rights hereunder, and posted by pre-paid letter addressed to the lessee, or delivered at his usual or last known place of abode or business, that the lease and license hereby granted is determined or shall be determined at the expiration of a certain period, shall be a sufficient determination of the lease and license from the time of posting or delivering such notice, or from the expiration of the period therein mentioned, as the case may be. Any termination of this lease and license shall not release the lessee from his obligation to pay rent for the period prior to such termination, and shall be without prejudice to any other rights or remedies which the lessor may have for violation of contract, use of machines without right, or use of patents without license.

Eight. The lessee admits the validity of each and every of the Letters Patent of the United States owned by the lessor or under which it is licensed, any of the inventions of which are or hereafter may be embodied in the said machinery, and agrees that he will not directly or indirectly infringe or contest the validity of or the title of the lessor to any of said patents, and that he shall be forever estopped from so doing. The determination or cessor of this lease and license from any cause whatever shall not in any way affect the provisions of this clause, or release or discharge the lessee from the admission and estoppel herein set forth.

Nine. None of the terms or conditions of this lease and license shall be held to have been waived by any act or knowledge of the lessor, its agents or employees, but only by an instrument in writing, signed by the president, a vice-president, or the treasurer of the lessor.

Ten. The term "lessor" shall include the said United Shoe Ma-

chinery Company, and its successors and assigns. All the conditions and agreements binding on the lessee shall be binding on and enforceable against his legal representatives. In the construction of this instrument, words relating to the number and gender of the parties shall be read according to their real number and gender.

In witness whereof, the parties hereto have duly executed this instrument on the day and year first above written.

R. C. DEAN,

[SEAL] UNITED SHOE MACHINERY COMPANY,

Geo. W. Brown, Treas.

Lease and License No. *283B.*

This Lease and Agreement made at Boston in the State of Massachusetts this *twentieth* day of *November* 1900, between the United Shoe Machinery Company, a corporation organized under the laws of the State of New Jersey, having an office in said Boston, hereinafter referred to as the lessor, of the one part, and *Easton Boot and Shoe Company* of *Easton, Pennsylvania*, hereinafter referred to as the lessee, of the other part:

Witnesseth, that the lessor, in consideration of the covenants and agreements on the part of the lessee herein contained, does hereby lease to and license the lessee under its patents to use the machine or machines now or hereafter delivered to the lessee and designated by number in the following schedule, viz.: —

Rapid Standard Screw Machine, No.
Old Style Standard Screw Machine, No.
Loose Nailing Machine, No.
Universal Slugging Machine, No. *1258–1268*,
Taper Nail Tacking Machine (D. H.), No.
Taper Nail Tacking Machine (S. H.), No.
String Nail Tacking Machine, No.
Power Welt Tacking Machine, No.
Cable Tacking Machine, No.
Universal Quilting Machine, No.
Heel Protector Driving Machine, No.
Grip Slugging Machine, No.
Grip Clinch Machine, No.
Grip Tacking Machine, No.
Lewis Nailing Machine, No.
Spatter Quilting Machine, No.
Double Row Pegging Machine, No.
National Slugging Machine, No.
Simplex Slugging Machine, No.
Champion Heel Seat Nailing Machine, No.
Champion Slugging Machine, No.
Staple Fastening Machine, No.
Automatic Staple Nailing Machine, No.
Universal Double Clinch Machine, No.
Gordon Staple Tacking Machine, No.
Corrugated Wire Tacking Machine, No.

and any parts, extras, duplicates, mechanisms, tools and devices relating thereto, or used in connection therewith, now attached to or delivered with the said designated machine or machines, or which may at any time hereafter be obtained from the lessor, or be added thereto with the consent of the lessor (the whole of which machine or machines, parts, extras, duplicates, mechanisms, tools and devices, held by the lessee under these presents, whether now or hereafter delivered to or in the possession of the lessee, is hereinafter referred to as "the said machinery"), subject to the conditions hereinafter contained.

And the following are agreed to as conditions of the lease and license of the said machinery, all of which the lessee covenants and agrees to keep and perform: —

One. The said machinery shall be used only by the lessee himself, or by operatives in his direct employ, and only in the factory now occupied by him at *Easton* in the State of *Pennyslvania*. The said machinery shall not be transferred or delivered or sublet to another, and neither the lease nor the license hereby granted can be assigned by the lessee by his own act or by operation of law. If the lessee becomes insolvent or bankrupt, or has a receiving order made against him, or makes or executes any bill of sale, deed of trust or assignment for the benefit of his creditors, or if a sale or lease or removal of said machinery, or any part thereof, without the consent in writing of the lessor, be made or attempted, or if any distress or execution or attachment be levied thereon, then and in each such case this lease and license and any other lease or license then existing between the lessor and the lessee shall at the option of the lessor cease and determine, and the possession and full right to and control of all the said machinery, and any machinery held by the lessee under any other lease or license from the lessor, shall thereupon revest in the lessor free from all claims or demands whatsoever. The said machinery shall at all times remain and be the sole and exclusive property of the lessor, and the lessee shall have no right of property therein but only the right to use the same, upon the conditions herein contained.

Two. The lessor and its agents and employees shall at all times have access to the said machinery for the purpose of inspecting it or watching its use and operation, or of altering, repairing, improving, or adding to it, or determining the nature or extent of its use, and the lessee shall afford all reasonable facilities therefor.

Three. The lessee shall at all times and at his own expense keep the said machinery in good and efficient working order and condition, and shall obtain from the lessor exclusively and shall pay therefor at the regular prices from time to time established by the lessor, all the duplicate parts, extras, devices and mechanisms of every kind needed or used in operating, repairing or renewing the

said machinery, and the lessee shall not otherwise make or allow to be made any addition, subtraction or alteration to, from or in the said machinery without the consent in writing of the lessor, nor interfere with the proper operation of the same. The lessee shall not permit any one to injure or deface or remove any plate, or dates, numbers, or other inscriptions now or hereafter impressed on or affixed to the said machinery by the lessor. The lessee shall use the said machinery to its full capacity so far as the number and kind of boots and shoes made in his factory will permit, except that the lessee agrees that the said machinery shall not be used in the manufacture of any boots or shoes which are lasted on machines other than those leased from the lessor or any welted boots or shoes which are not welted and stitched on welt sewing and sole stitching machines leased from the lessor, or turn shoes the soles of which are not attached by turn sewing machines leased from the lessor. In case the lessee has more work of the kind which can be performed by any of the machines belonging to the Metallic Department of the lessor than the capacity of the Metallic machinery which he has under lease from the lessor will permit, then the lessee shall either take from the lessor, under a like lease and agreement, sufficient additional machinery to perform the work, or in case the lessee does not thus lease additional Metallic machinery from the lessor, then the lessor may, if it so elects, cancel forthwith this lease and any other lease of Metallic machinery then in force between the lessor and the lessee, whether as a result of assignment or otherwise. The lessee shall pay all taxes and assessments which may be levied in respect to the said machinery, or in respect to this lease and license or the right to payments hereunder, upon whomsoever assessed. The lessee shall at his own expense insure against loss by fire and keep insured to the full value thereof the said machinery, and in case of loss shall pay forthwith to the lessor a sum equal to the full amount of the loss occasioned to the lessor.

Four. The lessee agrees, as rent or royalty for the said machinery, to purchase of the lessor at the prices established by the lessor, all the fastening material used by him in or in connection

with the said machinery, paying therefor in cash on delivery. The lessee hereby guarantees that for each machine hereby leased the amount of fastening material used by him and purchased from the lessor in accordance with the terms hereof shall not be less than four hundred pounds during each calendar year embraced by this lease, excepting that a reduction of thirty-three pounds from the amount thus guaranteed for each machine shall be allowed at the end of the year for each calendar month during which the factory of the lessee has remained wholly idle.

Five. The lessor may attach to the said machinery an indicator or indicators to register the number of revolutions or movements of any part or parts thereof, and the lessee shall not allow any person (other than the lessor or its agents) to disturb or interfere with such indicator or indicators. The lessee shall keep full and accurate accounts, independently of any indicators that may be placed upon said machinery, showing the number of boots and shoes or parts thereof in the manufacture of which the said machinery or any part thereof shall be used, and shall allow the lessor at all times by its agents or attorneys to examine and to take copies of such accounts and entries of the lessee as may serve to indicate the total number of boots and shoes made by the aid of said machinery or any part thereof, and the lessee shall produce all such papers and books upon request.

Six. This lease and license shall continue, unless sooner terminated by the lessor because of breach thereof on the part of the lessee, or otherwise as herein provided, for seventeen years from the date hereof. But if any breach or default shall be made in the observance of any one or more of the conditions or agreements herein contained or contained in any other lease or license agreement subsisting between the lessor and the lessee whether as the result of assignment to the lessor or otherwise and expressed to be obligatory upon the lessee, the lessor shall have the right by notice in writing to the lessee to terminate forthwith this lease and license and also if the lessor so elects any other lease or license agreements then in force between the lessor and the lessee whether as the result of assignment to the lessor or otherwise, and this not-

withstanding that previous breaches or defaults may have been unnoticed, waived or condoned by or on behalf of the lessor. If, upon the expiration of the full term of this lease, the lessor does not request the return of the said machinery, then the said machinery shall continue to be held and used under and in accordance with the conditions of this lease and license, which shall thereupon be extended indefinitely as to term; but thereafter either the lessee or the lessor, upon sixty days' notice in writing to the other, may terminate this lease and license, whereupon the said machinery shall be delivered forthwith to the lessor, as herein provided. Upon the expiration or termination of this lease and license or any extension thereof by notice or by reason of any default on the part of the lessee as to the terms of this lease or any other lease with the lessor, or otherwise as herein provided, the lessee shall forthwith deliver the said machinery to the lessor at its office or factory; and the lessee for himself, his heirs, executors and administrators, hereby grants to the lessor, its successors and assigns, full right, power and authority to enter upon the premises and into any factory, room, or any place where the said machinery, or any part thereof, may be, and take possession thereof, and take away the same, and the lessee in addition and without prejudice to any other rights and remedies of the lessor hereunder, shall thereupon pay to the lessor such sum as may be necessary to put the said machinery in suitable order and condition to lease to another lessee.

Seven. A notice in writing, signed by the president, a vice-president or the treasurer of the lessor or by the assignee of the lessor's rights hereunder and posted by the pre-paid letter, addressed to the lessee or delivered at his usual or last known place of abode or business, that the lease and license hereby granted is determined or shall be determined at the expiration of a certain period, shall be a sufficient determination of the lease and license from the time of posting or delivering such notice, or from the expiration of the period therein mentioned, as the case may be. Any termination of this lease and license shall not release the lessee from his obligation to pay rent for the period prior to such termination, and shall be without prejudice to any other rights or reme-

dies which the lessor may have for violation of contract, use of machines without right, or use of patents without license.

Eight. The lessee admits the validity of each and every of the letters patent of the United States owned by the lessor or under which it is licensed, any of the inventions of which are or hereafter may be embodied in the said machinery. The lessee also agrees that he will not directly or indirectly infringe or contest the validity of, or the title of the lessor to, any of the patents referred to in the "Schedule of Patents" hereto annexed, and that he shall be forever estopped from so doing. The termination or cesser of this lease and license from any cause whatever shall not in way affect the provisions of this clause, or release or discharge the lessee from the admission and estoppel herein set forth.

Nine. None of the terms or conditions of this lease and license shall be held to have been waived by any act or knowledge of the lessor, its agents or employees, but only by an instrument in writing, signed by the president, a vice-president or the treasurer of the lessor.

Ten. The term "lessor" shall include the said United Shoe Machinery Company and its successors and assigns. All the conditions and agreements binding on the lessee shall be binding on and enforceable against his legal representatives. In the construction of this instrument, words relating to the number and gender of the parties shall be read according to their real number and gender.

In witness whereof, the parties hereto have duly executed this instrument in duplicate, the day and year first above written.

Independent Lease. 301.

Metallic Department.

Lease and License Number .

This Lease and Agreement made at Boston, in the State of Massachusetts, this day of 19 , between the United Shoe Machinery Company, a corporation organized under the laws of the State of New Jersey, having an office in said Boston, hereinafter referred to as the lessor, of the one part, and of hereinafter referred to as the lessee, of the other part:

Witnesseth, that the lessor, in consideration of the covenants and agreements on the part of the lessee herein contained, does hereby lease to and license the lessee under its patents to use the machine or machines known as "Metallic Department" machinery now or hereafter delivered to the lessee and designated by number in the following schedule, viz:—

SCHEDULE OF MACHINES.

Rapid Standard Screw Machine, No.
Old Style Standard Screw Machine, No.
Loose Nailing Machine, No.
Universal Slugging Machine, No.
Taper Nail Tacking Machine (D. H.), No.
Taper Nail Tacking Machine (S. H.), No.
String Nail Tacking Machine, No.
Power Welt Tacking Machine, No.
Cable Tacking Machine, No.
Universal Quilting Machine, No.
Heel Protector Driving Machine, No.
Grip Slugging Machine, No.
Grip Clinch Machine, No.
Grip Tacking Machine, No.
Lewis Nailing Machine, No.
Spatter Quilting Machine, No.

National Slugging Machine, No.
Simplex Slugging Machine, No.
Champion Heel Seat Nailing Machine, No.
Champion Slugging Machine, No.
Staple Fastening Machine, No.
Automatic Staple Nailing Machine, No.
Universal Double Clinch Machine, No.
Gordon Staple Tacking Machine, No.
Corrugated Wire Tacking Machine, No.

and any duplicate parts, extras, mechanisms and devices, relating thereto, or used in connection therewith, now attached to or delivered with the said designated machine or machines, or which may at any time hereinafter be obtained from the lessor, or be added thereto with the consent of the lessor (the whole of which machine or machines, duplicate parts, extras, mechanisms and devices, held by the lessee under these presents, whether now or hereafter delivered to or in the possession of the lessee, is hereinafter referred to as the "leased machinery"), subject to the conditions hereinafter contained.

And that the following are agreed to as conditions of the lease and license of the leased machinery, all of which the lessee covenants and agrees to keep and perform:—

One. The leased machinery shall at all times remain and be the sole and exclusive property of the lessor, and the lessee shall have no right of property therein, but only the right to use the same, upon the conditions herein contained. The leased machinery shall be used only by the lessee himself, or by operatives in his direct employ, and only in the factory now occupied by him at in the State of . The leased machinery shall not be transferred or delivered or sublet to any other person or corporation, and neither the lease nor the license hereby granted can be assigned by the lessee by his own act or by operation of law. If the lessee becomes insolvent or bankrupt, or has a receiving order made against him, or makes or executes any bill of sale, deed of trust or assignment for the benefit of his creditors, or if a sale or lease or removal of the leased machinery, or any part thereof, without the consent in

writing of the lessor, be made or attempted, or if any distress or execution or attachment be levied thereon, then and in each such case this lease and license and any other lease or license then existing between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, shall at the option of the lessor cease and determine, and the possession of and full right to and control of all the leased machinery, and any machinery held by the lessee under any other lease or license from the lessor, whether as the result of assignment to the lessor or otherwise, shall thereupon revest in the lessor free from all claims or demands whatsoever. The lessor and its agents and employees shall at all times be given access to the leased machinery for the purpose of inspecting it or watching its use and operation, or of altering, repairing, improving, or adding to it, or determining the nature or extent of its use, and the lessee shall afford all reasonable facilities therefor.

Two. The lessee shall at all times and at his own expense keep the leased machinery in good and efficient working order and condition, and shall not permit any one to injure or deface or remove any plate, or dates, numbers, or other inscriptions now or hereafter impressed on or affixed to the leased machinery by the lessor. The lessee shall obtain from the lessor exclusively and shall pay therefor at the regular prices from time to time established by the lessor, all the duplicate parts, extras, mechanisms and devices, of every kind needed or used in operating, repairing, or renewing the leased machinery, and the same shall form part of the leased machinery, and the lessee shall not otherwise make or allow to be made any addition, subtraction or alteration to, from, or in the leased machinery without the consent in writing of the lessor, nor interfere with the proper operation of the same.

Three. The lessee shall pay all taxes and assessments which shall be levied in respect to the leased machinery, or in respect to this lease and license or the right to payments hereunder, upon whomsoever assessed. The lessee shall at his own expense insure against loss by fire and keep insured to the full value thereof the leased

machinery, and in case of loss shall pay forthwith to the lessor a sum equal to the full amount of the loss occasioned to the lessor.

Four. **The lessee, as rent and royalty for the leased machinery, shall purchase exclusively of the lessor all the fastening material used by him in or in connection with the leased machinery, and shall pay the lessor in cash on delivery the regular and uniform prices therefor as established from time to time by the lessor, which shall not be more than ten (10) per cent. in excess of the prices to be established from time to time by the lessor for like fastening material to be used in its Metallic Department machinery by lessees who shall agree not to use the Metallic Department machinery leased to them in the manufacture of boots or shoes which are lasted on machines other than those leased from the lessor, or of welted boots or shoes which are not welted and stitched on welt sewing and sole stitching machines leased from the lessor, or of turned shoes the soles of which are not attached by turn sewing machines leased from the lessor.**

Five. The lessor may attach to the leased machinery an indicator or indicators to register the number of revolutions or movements of any part or parts thereof, and the lessee shall not allow any person (other than the lessor or its agents) to disturb or interfere with such indicator or indicators. The lessee shall keep full and accurate accounts, independently of any indicators that may be placed upon the leased machinery, showing the number of boots, shoes and other footwear or portions thereof in the manufacture of which the leased machinery or any part thereof shall be used, and shall allow the lessor at all times by its agents or attorneys to examine and to take copies of such accounts and entries of the lessee as may serve to indicate the total number of boots, shoes and other footwear, or portions thereof made by the aid of the leased machinery or any part thereof, and the lessee shall produce all such papers and books upon request.

And that the following agreements, stipulations and provisions are agreed to: —

Six. The lessee for a period of five years from the date of this

lease and license shall use the leased machinery to its full capacity so far as the number and kind of boots and shoes made in his factory will permit, and his failure to use the leased machinery to its full capacity shall render him liable in damages to the lessor. During the remainder of the term of this lease and license after five years from the date hereof, the lessee shall continue to use the leased machinery to its full capacity so far as the number and kind of boots and shoes made in his factory will permit.

In case the lessee has more work of the kind which can be performed by any of the machines belonging to the Metallic Department of the lessor than the capacity of the Metallic Department machinery which he has under lease from the lessor will permit, then the lessee shall take from the lessor under a like lease and license sufficient additional Metallic Department machinery to perform the work, and the lessor shall lease such additional Metallic Department machinery to the lessee from time to time when required by the lessee, under a like lease and license if this lease and license is then in force, and if the lessee is not then in default in respect to any of the conditions, agreements, stipulations, and provisions in this lease and license contained.

Whenever for a period of three consecutive months the lessee shall fail to use all the leased machinery to an amount that will give to each machine at least three-fourths of a fair day's work during such period, the lessee from time to time and at all times upon the written request of the lessor, shall return to the lessor by delivery at its office or factory, such of the leased machinery as, in the opinion of the lessor, shall not be reasonably required by the lessee in the operation of his said factory, and shall pay to the lessor such sums as may be necessary to put the machinery so returned in suitable order and condition to lease to another lessee.

The lessee hereby agrees that for each machine hereby leased the amount of fastening material used by him and purchased from the lessor in accordance with the terms hereof shall not be less than four hundred (400) pounds during each calendar year embraced by this lease, excepting that a reduction of thirty-three (33) pounds from the amount thus guaranteed for each machine shall be

allowed at the end of the year for each calendar month during which the factory of the lessee has remained wholly idle. Upon any breach or default on the part of the lessee in the observance of the agreements, stipulations and provisions in this article "Six" contained, the lessor, although it may have waived or ignored prior breaches or defaults, may, at its option, terminate forthwith by notice in writing this lease and license and any other lease or license of Metallic Department machines, machinery or devices, like those or any of them mentioned in the foregoing Schedule of Machines, then existing between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise; and the possession of and full right to and control of all Metallic Department machinery held by the lessee under lease or license from the lessor or its assignors shall thereupon revest in the lessor, free from all claims and demands whatsoever, and the lessee shall thereupon pay to the lessor such sum as shall be necessary to put all such machinery in suitable order and condition to lease to another lessee; but a breach or default on the part of the lessee in the observance of his agreements in respect to the extent of the use of the leased machinery and the amount of fastening material to be purchased by him in this article "Six" contained shall not entitle the lessor to any other remedy than the right to terminate this lease and license and any other lease or license of Metallic Department machinery as above provided, except the right to damages for breach of the first agreement, covering the term of five years, in this article "Six" contained and therein expressly given.

Seven. This lease and license shall continue, unless sooner terminated by the lessor because of breach thereof on the part of the lessee, or otherwise as herein provided, for seventeen years from the date hereof. But if any breach or default shall be made in the observance of any one or more of the conditions herein contained or contained in any other lease or license agreement subsisting between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise and expressed to be obligatory upon the lessee, the lessor shall have the right by notice in writing to the lessee to terminate forthwith this lease and license, and also, if

the lessor so elects, any other lease or license agreements then in force between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, and this notwithstanding that previous breaches or defaults may have been unnoticed, waived, or condoned by or on behalf of the lessor. If, upon the expiration of the full term of this lease, the lessor does not request the return of the leased machinery, then the leased machinery shall continue to be held and used under and in accordance with the conditions of this lease and license, which shall thereupon be extended indefinitely as to term, but thereafter either the lessee, or the lessor, upon sixty days' notice in writing to the other, may terminate this lease and license, whereupon the leased machinery shall be delivered forthwith to the lessor, as herein provided. Upon the expiration or termination of this lease and license or any extension thereof by notice or by reason of any default on the part of the lessee as to the terms of this lease and license or any other lease or license from the lessor, or otherwise as herein provided, the lessee shall forthwith deliver the leased machinery to the lessor at its office or factory in good order, reasonable wear and tear alone excepted ; and the lessee for himself, his heirs, executors and administrators, hereby grants to the lessor, its successors and assigns, full right, power and authority to enter upon the premises and into any factory, room, or any place where the leased machinery, or any part thereof, may be, and take possession thereof, and take away the same ; and the lessee, in addition and without prejudice to any other rights and remedies of the lessor hereunder, shall thereupon pay to the lessor such sum as may be necessary to put the leased machinery in suitable order and condition to lease to another lessee.

Eight. Whenever the right to terminate this lease and license shall have accrued to the lessor, a notice in writing, signed by the president, a vice-president, or the treasurer of the lessor, or by any assignee of the lessor's rights hereunder and posted by prepaid letter, addressed to the lessee or delivered at his usual or last known place of abode or business, that the lease and license hereby granted is determined or shall be determined at the expiration of a certain period, shall be a sufficient determination of the lease and license

from the time of posting or delivering such notice, or from the expiration of the period therein mentioned, as the case may be. Any termination of this lease and license shall not release the lessee from his obligation to pay rent or royalty for the period prior to such termination, and shall be without prejudice to any other rights or remedies which the lessor may have for violation of contract, use of machines without right, or use of patented inventions without license.

Nine. The lessee admits the validity of each and every of the Letters Patent of the United States of America, owned by the lessor or under which it is licensed, any of the inventions of which are or hereafter may be embodied in the leased machinery. The lessee also agrees that he will not directly or indirectly infringe or contest the validity of, or the title of the lessor to, any of the patents referred to in the "Schedule of Patents" hereto annexed. The termination or cesser of this lease and license from any cause whatever shall not in any way affect the provisions of this clause, or release or discharge the lessee from the admission and estoppel herein set forth, so far as any act committed during the existence of this lease and license is concerned.

Ten. None of the terms or conditions of this lease and license shall be held to have been waived by any act or knowledge of the lessor, its agents or employees, but only by an instrument in writing, signed by the president, a vice-president, or the treasurer of the lessor.

Eleven. The term "lessor" shall include the said United Shoe Machinery Company and its successors and assigns. All the conditions and agreements binding on the lessee shall be binding on and enforceable against his legal representatives. In the construction of this instrument, words relating to the number and gender of the parties shall be read according to their real number and gender.

Twelve. The lessee, if not in default in respect to any of the conditions, agreements, stipulations and provisions herein contained, upon giving six months' notice in writing to the lessor of his intention so to do, shall have the privilege of surrendering this lease and

license, by executing such other form of lease and license agreement in respect to the leased machinery as the lessor shall have in use at the time of such surrender.

In witness whereof, the parties hereto have duly executed this instrument in duplicate, the day and year first above written.

☞ If lessee is a corporation, add corporate seal.

SCHEDULE OF PATENTS.
(Referred to in Article Nine herein.)

Nos. 297,718, April 29, 1884; 319,127, June 2, 1885; 325,274, Sept. 1, 1885; 325,275, Sept. 1, 1885; 334,361, Jan. 12, 1886; 334,362, Jan. 12, 1886; 334,809, Jan. 26, 1886; 346,127, July 27, 1886; 346,128, July 27, 1886; 346,129, July 27, 1886; 346,-130, July 27, 1886; 354,051, Dec. 7, 1886; 354,052, Dec. 7, 1886; 364,776, June 14, 1887; 364,777, June 14, 1887; 364,778, June 14, 1887; 364,779, June 14, 1887; 380,662, April 3, 1888; 403,-081, May 7, 1889; 410,927, Sept. 10, 1889; 413,463, Oct. 22, 1889; 416,272, Dec. 3, 1889; 429,862, June 10, 1890; 431,339, July 1, 1890; 432,074, July 15, 1890; 440,723, Nov. 18, 1890; 447,358, March 3, 1891; 447,359, March 3, 1891; 457,257, Aug. 4, 1891; 459,698, Sept. 15, 1891; 487,404, Dec. 6, 1892; 520,437, May 29, 1894; 525,066, Aug. 28, 1894; 554,200, Feb. 4, 1896; 554,931, Feb. 18, 1896; 555,314, Feb. 25, 1896; 560,968, May 26, 1896; 561,206, June 2, 1896; 562,597, June 23, 1896; 562,-703, June 23, 1896; 578,696, March 9, 1897; 579,390, March 23, 1897; 582,579, May 11, 1897; 582,580, May 11, 1897; 591,658, Oct. 12, 1897; 601,255, March 29, 1898; 610,475, Sept. 6, 1898; 612,799, Oct. 18, 1898; 612,487, Oct. 18, 1898; 287,375, Oct. 23, 1883; 288,421, Nov. 13, 1883; 288,422, Nov. 13, 1883; 288,423, Nov. 13, 1883; 288,424, Nov. 13, 1883; 288,425, Nov. 13, 1883; 289,103, Nov. 27, 1883; 300,077, June 10, 1884; 301,114, July 1, 1884; 301,493, July 8, 1884; 310,816, Jan. 13, 1885; 310,-817, Jan. 13, 1885; 329,031, Oct. 27, 1885; 329,449, Nov. 3, 1885; 331,925, Dec. 8, 1885; 331,926, Dec. 8, 1885; 351,372, Oct. 26, 1886; 356,107, Jan. 18, 1887; 360,428, April 5, 1887;

360,585, April 5, 1887; 370,135, Sept. 20, 1887; 370,136, Sept. 20, 1887; 373,234, Nov. 15, 1887; 374,549, Dec. 6, 1887; 383,455, May 29, 1888; 385,801, July 10, 1888; 385,802, July 10, 1888; 388,128, Aug. 21, 1888; 398,606, Feb. 26, 1889; 398,891, March 5, 1889; 403,835, May 21, 1889; 402,014, April 23, 1889; 429,527, June 3, 1890; 429,528, June 3, 1890; 440,805, Nov. 18, 1890; 443,077, Dec. 16, 1890; 451,001, April 21, 1891; 456,113, July 14, 1891; 472,638, April 12, 1892; 467,104, Jan. 12, 1892; 475,729, May 24, 1892; 475,868, May 31, 1892; 478,054, June 28, 1892; 478,055, June 28, 1892; 478,056, June 28, 1892; 490,621, Jan. 24, 1893; 490,622, Jan. 24, 1893; 490,623, Jan. 24, 1893; 490,624, Jan. 24, 1893; 490,625, Jan. 24, 1893; 493,910, March 21, 1893; 502,212, July 25, 1893; 545,487, Sept. 3, 1895; 552,903, Jan. 14, 1896; 556,501, March 17, 1896; 559,129, April 28, 1896; 559,130, April 28, 1896; 563,478, July 7, 1896; 565,073, Aug. 4, 1896; 565,074, Aug. 4, 1896; 568,248, Sept. 22, 1896; 577,235, Feb. 16, 1897; 581,458, April 27, 1897; 581,459, April 27, 1897; 584,775, June 22, 1897; 587,144, July 27, 1897; 602,184, April 12, 1898; 603,394, May 3, 1898; 606,045, June 21, 1898; 609,874, Aug. 30, 1898; 611,990, Oct. 4, 1898; 611,991, Oct. 4, 1898; 611,405, Sept. 27, 1898; 335,154, Feb. 2, 1886; 447,681, March 3, 1891; 521,369, June 12, 1894; 571,227, Nov. 10, 1896; 347,323, Aug 17, 1886; 575,296, Jan. 12, 1897; 538,322, April 30, 1895; 610,320, Sept. 6, 1898; 280,267, June 26, 1883; 291,443, Jan. 1, 1884; 299,041, May 20, 1884; 301,464, July 1, 1884; 335,260, Feb. 2, 1886; 335,261, Feb. 2, 1886; 341,193, May 4, 1886; 426,274, April 22, 1890; 434,274, Aug 12, 1890; 607,924, July 26, 1898; 615,481, Dec. 6, 1898; 548,343, Oct. 22, 1895; 586,153, July 13, 1897; 586,154, July 13, 1897; 669,022, Feb. 26, 1901; 669,023, Feb. 26, 1901; 669,024, Feb. 26, 1901; 669,025, Feb. 26, 1901; 669,026, Feb. 26, 1901.

399,410, March 12, 1889; 408,173, July 30, 1889; 415,175, Nov. 12, 1889; 461,510, Oct. 20, 1891; 461,853, Oct. 27, 1891; 467,522, Jan. 26, 1892; 520,437, May 29, 1894; 541,201, June 18, 1895; De. 24,483, July 16, 1895; De. 24,757, Oct. 15, 1895;

De. 24,758, Oct. 15, 1895; De. 24,759, Oct. 15, 1895; De. 24,760, Oct. 15, 1895; De. 24,761, Oct. 15, 1895; De. 24,762, Oct. 15, 1895; De. 24,763, Oct. 15, 1895; De. 24,764, Oct. 15, 1895; De. 24,765, Oct. 15, 1895; 551,118, Dec. 10, 1895; De. 25,211, March 3, 1896; 570,633, Nov. 3, 1996; 575,296, Jan. 12, 1897; 584,735, June 15, 1897; 602,390, Apr. 12, 1898; 614,460, Nov. 22, 1898; 618,027, Jan. 17, 1899; De. 30,112, Jan. 31, 1899; 639,694, Dec. 19, 1899; 641,099, Jan. 9, 1900; 654,762, July 31, 1900; 655,223, Aug. 7, 1900; 687,686, Nov. 26, 1901; 687,687, Nov. 26, 1901; 691,354, Jan. 21, 1902; Re. 11,962, Jan. 21, 1902; 693,686, Feb. 18, 1902; 705,512, July 22, 1902; 711,248, Oct. 14, 1902; 712,866, Nov. 4, 1902; 714,572, Nov. 25, 1902; 721,016, Feb. 17, 1903; 722,659, March 17, 1903; 724,432, Apr. 7, 1903; 736,825, Aug. 18, 1903; 741,522, Oct. 13, 1903; 762,-802, June 14, 1904; 765,392, July 19, 1904; 765,650, July 19, 1904; 767,520, Aug. 16, 1904; 767,521, Aug. 16, 1904; 768,-560, Aug. 23, 1904; 768,811, Aug. 30, 1904; 768,812, Aug. 30, 1904; 776,832, Dec. 6, 1904; 784,249, March 7, 1905; 786,190, March 28, 1905.

[Put in Evidence, page 378.]

[TYPEWRITTEN RIDER ATTACHED TO THE FOLLOWING LEASE.]

The following provisions contained in Article Three of Metallic Department Lease and License No. , dated , granted by the United Shoe Machinery Company as lessor to of as lessee, covering is hereby stricken out, namely:

"except that the lessee agrees that the said machinery shall not be used in the manufacture of any boots or shoes which are lasted on machines or by the aid of lasting or tacking mechanisms other

than those leased from the lessor or any welted boots or shoes which are not welted and stitched on welt sewing and sole stitching machines leased from the lessor, or turn shoes the soles of which are not attached by turn sewing machines leased from the lessor."

Excepting as herein expressly provided none of the conditions, agreements, stipulations or provisions contained in said Lease and License is hereby in any wise waived or modified.

Dated this day of 19

Metallic Department. 600.

Lease and License Number .

This Lease and Agreement made at Boston, in the State of Massachusetts, this day of 19 , between the United Shoe Machinery Company, a corporation organized under the laws of the State of New Jersey, having an office in said Boston, hereinafter referred to as the lessor, of the one part, and of hereinafter referred to as the lessee, of the other part:

Witnesseth, that the lessor, in consideration of the covenants and agreements on the part of the lessee herein contained, does hereby lease to and license the lessee under any letters patent belonging to the lessor or under which the lessor has the right to grant such license affecting any inventions which are now or hereafter shall be embodied therein or employed in the operation thereof, to use the machine or machines now or hereafter delivered to the lessee and designated by the number in the following schedule, viz.: —

Rapid Standard Screw Machine, No.
Old Style Standard Screw Machine, No.
Loose Nailing Machine, No.
Universal Slugging Machine, No.
Taper Nail Tacking Machine (D. H.), No.
Taper Nail Tacking Machine (S. H.), No.
String Nail Tacking Machine, No.
Power Welt Tacking Machine, No.
Cable Tacking Machine, No.

Universal Quilting Machine, No.
Heel Protector Driving Machine, No.
Grip Slugging Machine, No.
Grip Clinch Machine, No.
Grip Tacking Machine, No.
Lewis Nailing Machine, No.
Spatter Quilting Machine, No.
Double Row Pegging Machine, No.
National Slugging Machine, No.
Simplex Slugging Machine, No.
Champion Heel Seat Nailing Machine, No.
Champion Slugging Machine, No.
Staple Fastening Machine, No.
Automatic Staple Nailing Machine, No.
Universal Double Clinch Machine, No.
Gordon Staple Tacking Machine, No.
Corrugated Wire Tacking Machine, No.
Knife Grinding Machine, No.

and any parts, extras, duplicates, mechanisms, tools and devices relating thereto, or used in connection therewith, now attached to or delivered with the said designated machine or machines, or which may at any time hereafter be obtained from the lessor, or be added thereto, with the consent of the lessor (the whole of which machine or machines, parts, extras, duplicates, mechanisms, tools and devices, held by the lessee under these presents, whether now or hereafter delivered to or in the possession of the lessee, is hereinafter referred to as "the said machinery"), subject to the conditions hereinafter contained.

And the following are agreed to as conditions of the lease and license of the said machinery, all of which the lessee covenants and agrees to keep and perform: —

One. The said machinery shall be used only by the leseee himself, or by operatives in his direct employ, and only in the factory now occupied by him at in the State of . The said machinery shall not be transferred or delivered or sublet to another, and neither the lease nor the license hereby granted can be assigned

by the lessee by his own act or by operation of law. If the lessee becomes insolvent or bankrupt, or has a receiving order made against him, or makes or executes any bill of sale, deed of trust or assignment for the benefit of his creditors, or if a sale or lease or removal of said machinery, or any part thereof, without the consent in writing of the lessor, be made or attempted, or if any distress or execution or attachment be levied thereon, then and in each such case this lease and licenee and any other lease or license then existing between the lessor and the lessee shall at the option of the lessor cease and determine, and the possession and full right to and control of all the said machinery, and any machinery held by the lessee under any other lease or license from the lessor, shall thereupon revest in the lessor free from all claims or demands whatsoever. The said machinery shall at all times remain and be the sole and exclusive property of the lessor, and the lessee shall have no right of property therein, but only the right to use the same, upon the conditions herein contained.

Two. The lessor and its agents and employees shall at all times have access to the said machinery for the purpose of inspecting it or watching its use and operation, or of altering, repairing, improving, or adding to it, or determining the nature or extent of its use, and the lessee shall afford all reasonable facilities therefor.

Three. The lessee shall at all times and at his own expense keep the said machinery in good and efficient working order and condition, and shall obtain from the lessor exclusively, and shall pay therefor at the regular prices from time to time established by the lessor, all the duplicate parts, extras, devices, and mechanisms of every kind needed or used in operating, repairing or renewing the said machinery, and the lessee shall not otherwise make or allow to be made any addition, subtraction or alteration to, from, or in the said machinery without the consent in writing of the lessor, nor interfere with the proper operation of the same. The lessee shall not permit any one to injure or deface or remove any plate, or dates, numbers, or other inscriptions now or hereafter impressed on or affixed to the said machinery by the lessor. The lessee shall use the said machinery to its full capacity so far as the number

and kind of boots and shoes made in his factory will permit, except that the lessee agrees that the said machinery shall not be used in the manufacture of any boots or shoes which are lasted on machines or by the aid of lasting or tacking mechanisms other than those leased from the lessor or any welted boots or shoes which are not welted and stitched on welt sewing and sole stitching machines leased from the lessor, or turn shoes the soles of which are not attached by turn sewing machines leased from the lessor. In case the lessee has more work of the kind which can be performed by any of the machines belonging to the Metallic Department of the lessor than the capacity of the Metallic machinery which he has under lease from the lessor will permit, then the lessee shall either take from the lessor, under a like lease and agreement, sufficient additional machinery to perform the work, or in case the lessee does not thus lease additional Metallic machinery from the lessor, then the lessor may, if it so elects, cancel forthwith this lease and any other lease of Metallic machinery then in force between the lessor and the lessee, whether as the result of assignment or otherwise. The lessee shall at his own expense insure against loss by fire and keep insured to the full value thereof the said machinery, and in case of loss shall pay forthwith to the lesser a sum equal to the full amount of the loss occasioned to the lessor.

Four. The lessee shall pay all taxes and assessments which shall be assessed in respect to the said machinery or other machinery of the lessor held by the lessee under lease or license upon whomsoever assessed. All taxes or assessments in respect to leases, licenses or agreements covering machinery, or the rights to payments thereunder, shall be construed, for the purposes of this article, to be assessed in respect to the machinery itself. In case at any time any unapportioned tax or assessment shall be assessed to the lessor in respect in part but not wholly to machinery of the lessor in the possession of the lessee the lessee shall pay to the lessor such proportionate part of the total amount of said unapportioned tax or assessment as the fair valuation, to be determined by the lessor, of said machinery of the lessor in the possession of the lessee bears to the fair valuation, to be determined by the lessor, of all ma-

chinery (excepting machinery, if any, in the lessor's own possession) in respect to which the unapportioned tax or assessment has been assessed: provided, however, that if such unapportioned tax or assessment includes any tax or assessment in respect to tangible property in the lessor's own possession the amount thereof, based, at the established rate, upon the fair valuation, to be determined by the lessor, of such property, shall first be deducted and the lessee shall pay his proportionate part as aforesaid of the balance only of said unapportioned tax or assessment after such deduction has been made.

Five. The lessee agrees, as rent or royalty for the said machinery, to purchase of the lessor at the prices established by the lessor, all the fastening material used by him in or in connection with the said machinery, paying therefor in cash on delivery. The lessee hereby guarantees that for each machine hereby leased the amount of fastening material used by him and purchased from the lessor in accordance with the terms hereof shall not be less than four hundred pounds during each calendar year embraced by this lease, excepting that a reduction of thirty-three pounds from the amount thus guaranteed for each machine shall be allowed at the end of the year for each calendar month during which the factory of the lessee has remained wholly idle.

Six. The lessor may attach to the said machinery an indicator or indicators to register the number of revolutions or movements of any part or parts thereof, and the lessee shall not allow any person (other than the lessor or its agents) to disturb or interfere with such indicator or indicators. The lessee shall keep full and accurate accounts, independently of any indicators that may be placed upon said machinery, showing the number of boots and shoes or parts thereof in the manufacture of which the said machinery or any part thereof shall be used, and shall allow the lessor at all times by its agents or attorneys to examine and to take copies of such accounts and entries of the lessee as may serve to indicate the total number of boots and shoes made by the aid of said machinery or any part thereof, and the lessee shall produce all such papers and books upon request.

Seven. This lease and license shall continue, unless sooner terminated by the lessor because of breach thereof on the part of the lessee, or otherwise as herein provided, for seventeen years from the date hereof. But if any breach or default shall be made in the observance of any one or more of the conditions or agreements herein contained or contained in any other lease or license agreement subsisting between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, and expressed to be obligatory upon the lessee, the lessor shall have the right, by notice in writing to the lessee, to terminate forthwith this lease and license and also if the lessor so elects any other lease or license agreements then in force between the lessor and the lessee whether as the result of assignment to the lessor or otherwise, and this notwithstanding that previous breaches or defaults may have been unnoticed, waived, or condoned by or on behalf of the lessor. If, upon the expiration of the full term of this lease, the lessor does not request the return of the said machinery, then the said machinery shall continue to be held and used under and in accordance with the conditions of this lease and license, which shall thereupon be extended indefinitely as to term; but thereafter either the lessee or the lessor, upon sixty days' notice in writing to the other, may terminate this lease and license, whereupon the said machinery shall be delivered forthwith to the lessor, as herein provided. Upon the expiration or termination of this lease and license or any extension thereof by notice or by reason of any default on the part of the lessee as to the terms of this lease or any other lease with the lessor, or otherwise as herein provided, the lessee shall forthwith deliver the said machinery to the lessor at its office or factory in good order and condition, reasonable wear and tear alone excepted; and the lessee for himself, his heirs, executors and administrators, hereby grants to the lessor, its successors and assigns, full right, power and authority to enter upon the premises and into any factory, room, or any place where the said machinery, or any part thereof, may be, and take possession thereof, and take away the same, and the lessee in addition and without prejudice to any other rights and remedies of the lessor hereunder, shall thereupon pay to the lessor

such sum as may be necessary to put the said machinery in suitable order and condition to lease to another lessee.

Eight. A notice in writing, signed by the president, a vice-president or the treasurer of the lessor, or by the assignee of the lessor's rights hereunder, and posted by prepaid letter, addressed to the lessee or delivered at his usual or last known place of abode or business, that the lease and license hereby granted is determined or shall be determined at the expiration of a certain period, shall be a sufficient determintion of the lease and license from the time of posting or delivering such notice, or from the expiration of the period therein mentioned, as the case may be. Any termination of this lease and license shall not release the lessee from his obligation to pay rent for the period prior to such termination, and shall be without prejudice to any other rights or remedies which the lessor may have for violation of contract, use of machines without right, or use of patents without license.

Nine. The lessee admits the validity for the full term expressed in the grant thereof (and every extension and renewal thereof) of each and every of the letters patent of the United States of America, owned by the lessor or under which it is licensed, any of the inventions of which are or hereafter may be embodied in the said machinery or embodied in the operation thereof. The lessee also agrees that he will not directly or indirectly infringe or contest the validity for the full term expressed in the grant thereof or of any extension or renewal thereof, of any of the Letters Patent referred to in the "Schedule of Patents" hereto annexed or the title of the lessor thereto. The expiration of this agreement or any extension thereof or the termination or cesser of the lease and license hereby granted shall not in any way affect the provisions of this clause, or release or discharge the lessee from the admissions and estoppels herein set forth.

Ten. None of the terms or conditions of this lease and license shall be held to have been waived by any act or knowledge of the lessor, its agents or employees, but only by an instrument in writing, signed by the president, a vice-president, or the treasurer of the lessor.

Eleven. The term "lessor" shall include the said United Shoe Machinery Company and its successors and assigns. All the conditions and agreements binding on the lessee shall be binding on and enforceable against his legal representatives. In the construction of this instrument, words relating to the number and gender of the parties shall be read according to their real number and gender.

In witness whereof, the parties hereto have duly executed this instrument in duplicate, the day and year first above written.

☞ If lessee is a corporation, add seal.

Metallic Department. 1100.

Lease and License Number .

This Lease and Agreement made at Boston, in the State of Massachusetts, this day of 19 , between the United Shoe Machinery Company, a corporation organized under the laws of the State of New Jersey, having an office in said Boston, hereinafter referred to as the lessor, of the one part, and of hereinafter referred to as the lessee, of the other part:

Witnesseth, that the lessor, in consideration of the covenants and agreements on the part of the lessee herein contained, does hereby lease to and license the lessee under any letters patent belonging to the lessor or under which the lessor has the right to grant such license affecting any inventions which are or hereafter shall be embodied therein or employed in the operation thereof, to use the machine or machines now or hereafter delivered to the lessee and designated by number in the following schedule, viz.:—

SCHEDULE OF MACHINES.

Rapid Standard Screw Machine, No.
Loose Nailing Machine, No.
Universal Slugging Machine, No.
Taper Nail Tacking Machine, No.
Grip Tacking Machine, No.
Staple Fastening Machine, No.

and any parts, extras, duplicates, mechanisms, tools and devices relating thereto, or used in connection therewith, now attached to or delivered with the said designated machine or machines, or which may at any time hereafter be obtained from the lessor, or be added thereto with the consent of the lessor (the whole of which machine or machines, parts, extras, duplicates, mechanisms, tools and devices, held by the lessee under these presents, whether now or hereafter delivered to or in the possession of the lessee, is hereinafter referred to as "the said machinery"), subject to the conditions hereinafter contained.

And the following are agreed to as conditions of the lease and license of the said machinery, all of which the lessee covenants and agrees to keep and perform: —

One. The said machinery shall be used only by the lessee himself, or by operatives in his direct employ, and only in the factory now occupied by him at in the State of . The said machinery shall not be transferred or delivered or sublet to another, and neither the lease nor the license hereby granted can be assigned by the lessee by his own act or by operation of law. If the lessee becomes insolvent or bankrupt, or has a receiving order made against him, or makes or executes any bill of sale, deed of trust or assignment for the benefit of his creditors, or if a sale or lease or removal of said machinery, or any part thereof, without the consent in writing of the lessor, be made or attempted, or if any distress or execution or attachment be levied thereon, then and in each such case this lease and license and any other lease or license then existing between the lessor and the lessee shall at the option of the lessor cease and determine, and the possession and full right to and control of all the said machinery, and any machinery held by the lessee under any other lease or license from the lessor, shall thereupon revest in the lssor free from all claims or demands whatsoever. The said machinery shall at all times remain and be the sole and exclusive property of the lessor, and the lessee shall have no right of property therein, but only the right to use the same, upon the conditions herein contained.

Two. The lessor and its agents and employees shall at all times have access to the said machinery for the purpose of inspecting it or watching its use and operation, or of altering, repairing, improving, or adding to it, or determining the nature or extent of its use, and the lessee shall afford all reasonable facilities therefor.

Three. The lessee shall at all times and at his own expense keep the said machinery in good and efficient working order and condition, and shall obtain from the lessor exclusively, and shall pay therefor at the regular prices from time to time established by the lessor, all the duplicate parts, extras, devices, and mechanisms of every kind needed or used in operating, repairing, or renewing the

said machinery, and the lessee shall not otherwise make or allow to be made any addition, subtraction or alteration to, from, or in the said machinery without the consent in writing of the lessor, nor interfere with the proper operation of the same. The lessee shall not permit any one to injure or deface or remove any plate, or dates, numbers, or other inscriptions now or hereafter impressed on or affixed to the said machinery by the lessor. The lessee shall use the said machinery to its full capacity so far as the number and kind of boots and shoes made in his factory will permit, and in case the lessee has more work of the kind which can be performed by any of the machines belonging to the Metallic Department of the lessor than the capacity of the Metallic machinery which he has under lease from the lessor will permit, then the lessee shall either take from the lessor, under a like lease and agreement, sufficient additional machinery to perform the work, or in case the lessee does not thus lease additional Metallic machinery from the lessor, then the lessor may, if it so elects, cancel forthwith this lease and any other lease of Metallic machinery then in force between the lessor and the lessee, whether as the result of assignment or otherwise.

Four. The lessee shall pay all taxes and assessments which shall be assessed in respect to the said machinery or other machinery of the lessor held by the lessee under lease or license upon whomsoever assessed. All taxes or assessments in respect to leases, licenses or agreements covering machinery, or the rights to payments thereunder, shall be construed, for the purposes of this article, to be assessed in respect to the machinery itself. In case at any time any unapportioned tax or assessment shall be assessed to the lessor in respect in part but not wholly to machinery of the lessor in the possession of the lessee the lessee shall pay to the lessor such proportionate part of the total amount of said unapportioned tax or assessment as the fair valuation, to be determined by the lessor, of said machinery of the lessor in the possession of the lessee bears to the fair valuation, to be determined by the lessor, of all machinery (excepting machinery, if any, in the lessor's own possession) in respect to which the unapportioned tax or assessment

has been assessed: provided, however, that if such unapportioned tax or assessment includes any tax or assessment in respect to tangible property in the lessor's own possession the amount thereof, based, at the established rate, upon the fair valuation, to be determined by the lessor, of such property, shall first be deducted and the lessee shall pay his proportionate part as aforesaid of the balance only of said unapportioned tax or assessment after such deduction has been made.

Five. The lessee shall pay to the lessor immediately upon the execution hereof as a lease premium the sum of dollars, and the lessee agrees, as rent or royalty for the said machinery, to purchase of the lessor at the prices established by the lessor, all the fastening material used by him in or in connection with the said machinery, paying therefor in cash on delivery. The lessee hereby guarantees that for each machine hereby leased the amount of fastening material used by him and purchased from the lessor in accordance with the terms hereof shall not be less than four hundred pounds during each calendar year embraced by this lease, excepting that a reduction of thirty-three pounds from the amount thus guaranteed for each machine shall be allowed at the end of the year for each calendar month during which the factory of the lessee has remained wholly idle.

Six. The lessor may attach to the said machinery an indicator or indicators to register the number of revolutions or movements of any part or parts thereof, and the lessee shall not allow any person (other than the lessor or its agents) to disturb or interfere with such indicator or indicators. The lessee shall keep full and accurate accounts, independently of any indicators that may be placed upon said machinery, showing the number of boots and shoes or parts thereof in the manufacture of which the said machinery or any part thereof shall be used, and shall allow the lessor at all times by its agents or attorneys to examine and to take copies of such accounts and entries of the lessee as may serve to indicate the total number of boots and shoes made by the aid of said machinery or any part thereof, and the lessee shall produce all such papers and books upon request.

Seven. This lease and license shall continue, unless sooner terminated by the lessor because of breach thereof on the part of the lessee, or otherwise as herein provided, for seventeen years from the date hereof. But if any breach or default shall be made in the observance of any one or more of the conditions or agreements herein contained or contained in any other lease or license agreement subsisting between the lessor and the lessee whether as the result of assignment to the lessor or otherwise and expressed to be obligatory upon the lessee, the lessor shall have the right by notice in writing to the lessee to terminate forthwith this lease and license and also if the lessor so elects any other lease or license agreements then in force between the lessor and the lessee whether as the result of assignment to the lessor or otherwise, and this notwithstanding that previous breaches or defaults may have been unnoticed, waived or condoned by or on behalf of the lessor. If, upon the expiration of the full term of this lease, the lessor does not request the return of the said machinery, then the said machinery shall continue to be held and used under and in accordance with the conditions of this lease and license, which shall thereupon be extended indefinitely as to to term; but thereafter either the lessee or the lessor, upon sixty days' notice in writing to the other, may terminate this lease and license, whereupon the said machinery shall be delivered forthwith to the lessor, as herein provided. Upon the expiration or termination of this lease and license or any extension thereof by notice or by reason of any default on the part of the lessee as to the terms of this lease or any other lease with the lessor, or otherwise as herein provided, the lessee shall forthwith deliver the said machinery to the lessor at its office or factory in good order and condition, reasonable wear and tear alone excepted; and the lessee for himself, his heirs, executors and administrators, hereby grants to the lessor, its successors and assigns, full right, power and authority to enter upon the premises and into any factory, room, or any place where the said machinery, or any part thereof, may be, and take possession thereof, and take away the same, and the lessee in addition and without prejudice to any other rights and remedies of the lessor hereunder, shall thereupon pay to the lessor

such sum as may be necessary to put the said machinery in suitable order and condition to lease to another lessee.

Eight. A notice in writing, signed by the president, a vice-president or the treasurer of the lessor or by the assignee of the lessor's rights hereunder and posted by pre-paid letter, addressed to the lessee or delivered at his usual or last known place of abode or business, that the lease and license hereby granted is determined or shall be determined at the expiration of a certain period, shall be a sufficient determination of the lease and license from the time of posting or delivering such notice, or from the expiration of the period therein mentioned, as the case may be. Any termination of this lease and license shall not release the lessee from his obligation to pay rent for the period prior to such termination, and shall be without prejudice to any other rights or remedies which the lessor may have for violation of contract, use of machines without right, or use of patents without license.

Nine. The lessee admits the validity for the full term expressed in the grant thereof (and every extension and renewal thereof) of each and every of the letters patent of the United States of America owned by the lessor or under which it is licensed, any of the inventions of which are or hereafter may be embodied in the said machinery or embodied in the operation thereof. The lessee also agrees that he will not directly or indirectly infringe or contest the validity for the full term expressed in the grant thereof or of any extension or renewal thereof, of any of the Letters Patent referred to in the Schedule of Patents hereto annexed or the title of the lessor thereto. The expiration of this agreement or any extension thereof or the termination or cesser of the lease and license hereby granted shall not in any way affect the provisions of this clause, or release or discharge the lessee from the admissions and estoppels herein set forth.

Ten. None of the terms or conditions of this lease and license shall be held to have been waived by any act or knowledge of the lessor, its agents or employees, but only by an instrument in writing, signed by the president, a vice-president or the treasurer of the lessor.

Eleven. The term "lessor" shall include the said United Shoe Machinery Company and its successors and assigns. All the conditions and agreements binding on the lessee shall be binding on and enforceable against his legal representatives. In the construction of this instrument, words relating to the number and gender of the parties shall be read according to their real number and gender.

In witness whereof, the parties hereto have duly executed this instrument in duplicate, the day and year first above written.

☞ If lessee is a corporation, add seal.

Metallic Department. 800.

Lease and License Number .

This Lease and Agreement made at Boston, in the State of Massachusetts, this day of 19 , between the United Shoe Machinery Company, a corporation organized under the laws of the State of New Jersey, having an office in said Boston, hereinafter referred to as the lessor, of the one part, and of hereinafter referred to as the lessee, of the other part:

Witnesseth that the lessor, in consideration of the covenants and agreements on the part of the lessee herein contained, does hereby lease to and license the lessee under any letters patent belonging to the lessor or under which the lessor has the right to grant such license affecting any inventions which are or hereafter shall be embodied therein or employed in the operation thereof, to use the machine or machines now or hereafter delivered to the lessee and designated by number in the following schedule, viz.:—

SCHEDULE OF MACHINES.

Loose Nailing Machine, No.
Universal Slugging Machine, No.
Taper Nail Tacking Machine, No.
Grip Tacking Machine, No.
Staple Fastening Machine, No.
Knife Grinder, No.

and any parts, extras, duplicates, mechanisms, tools and devices relating thereto, or used in connection therewith, now attached to or delivered with the said designated machine or machines, or which may at any time hereafter be obtained from the lessor, or be added thereto with the consent of the lessor, (the whole of which machine or machines, parts, extras, duplicates, mechanisms, tools and devices held by the lessee under these presents, whether now or hereafter delivered to or in the possession of the lessee, is hereinafter referred to as "the said machinery"), subject to the conditions hereinafter contained.

And the following are agreed to as conditions of the lease and license of the said machinery, all of which the lessee covenants and agrees to keep and perform : —

One. The said machinery shall be used only by the lessee himself, or by operatives in his direct employ, and only in the factory now occupied by him at in the State of . The said machinery shall not be transferred or delivered or sublet to another, and neither the lease nor the license hereby granted can be assigned by the lessee by his own act or by operation of law. If the lessee becomes insolvent or bankrupt, or has a receiving order made against him, or makes or executes any bill of sale, deed of trust or assignment for the benefit of his creditors, or if a sale or lease or removal of said machinery, or any part thereof, without the consent in writing of the lessor, be made or attempted, or if any distress or execution or attachment be levied thereon, then and in each such case this lease and license and any other lease or license then existing between the lessor and the lessee shall at the option of the lessor cease and determine, and the possession and full right to and control of all the said machinery, and any machinery held by the lessee under any other lease or license from the lessor, shall thereupon revest in the lessor free from all claims or demands whatsoever. The said machinery shall at all times remain and be the sole and exclusive property of the lessor, and the lessee shall have no right of property therein, but only the right to use the same, upon the conditions herein contained.

Two. The lessor and its agents and employees shall at all times have access to the said machinery for the purpose of inspecting it or watching its use and operation, or of altering, repairing, improving, or adding to it, or determining the nature or extent of its use, and the lessee shall afford all reasonable facilities therefor.

Three. The lessee shall at all times and at his own expense keep the said machinery in good and efficient working order and condition, and shall obtain from the lessor exclusively, and shall pay therefor at the regular prices from time to time established by the lessor, all the duplicate parts, extras, devices, and mechanisms of every kind needed or used in operating, repairing, or renewing the

said machinery, and the lessee shall not otherwise make or allow to be made any addition, subtraction or alteration to, from, or in the said machinery without the consent in writing of the lessor, nor interfere with the proper operation of the same. The lessee shall not permit any one to injure or deface or remove any plate, or dates, numbers, or other inscriptions now or hereafter impressed on or affixed to the said machinery by the lessor. The lessee shall use the said machinery to its full capacity so far as the number and kind of boots and shoes made in his factory will permit, except that the lessee agrees that the said machinery shall not be used in the manufacture of any boots or shoes which are lasted on machines or by the aid of lasting or tacking mechanisms other than those leased from the lessor or any welted boots or shoes which are not welted and stitched on welt sewing and sole stitching machines leased from the lessor, or turn shoes the soles of which are not attached by turn sewing machines leased from the lessor. In case the lessee has more work of the kind which can be performed by any of the machines belonging to the Metallic Department of the lessor than the capacity of the Metallic machinery which he has under lease from the lessor will permit, then the lessee shall either take from the lessor, under a like lease and agreement, sufficient additional machinery to perform the work, or in case the lessee does not thus lease additional Metallic machinery from the lessor, then the lessor may, if it so elects, cancel forthwith this lease and any other lease of Metallic machinery then in force between the lessor and the lessee, whether as the result of assignment or otherwise. The lessee shall at his own expense insure against loss by fire and keep insured to the full value thereof the said machinery, and in case of loss shall pay forthwith to the lessor a sum equal to the full amount of the loss occasioned to the lessor.

Four. The lessee shall pay all taxes and assessments which shall be assessed in respect to the said machinery or other machinery of the lessor held by the lessee under lease or license upon whomsoever assessed. All taxes or assessments in respect to leases, licenses or agreements covering machinery, or the rights to payments thereunder, shall be construed, for the purposes of this

article, to be assessed in respect to the machinery itself. In case at any time any unapportioned tax or assessment shall be assessed to the lessor in respect in part but not wholly to machinery of the lessor in the possession of the lessee the lessee shall pay to the lessor such proportionate part of the total amount of said unapportioned tax or assessment as the fair valuation, to be determined by the lessor, of said machinery of the lessor in the possession of the lessee bears to the fair valuation, to be determined by the lessor, of all machinery (excepting machinery, if any, in the lessor's own possession) in respect to which the unapportioned tax or assessment has been assessed: provided, however, that if such unapportioned tax or assessment includes any tax or assessment in respect to tangible property in the lessor's own possession the amount thereof, based, at the established rate, upon the fair valuation, to be determined by the lessor, of such property, shall first be deducted and the lessee shall pay his proportionate part as aforesaid of the balance only of said unapportioned tax or assessment after such deduction has been made.

Five. The lessee agrees, as rent or royalty for the said machinery, to purchase of the lessor at the prices established by the lessor, all the fastening material used by him in or in connection with the said machinery, paying therefor in cash on delivery. The lessee hereby guarantees that for each machine hereby leased the amount of fastening material used by him and purchased from the lessor in accordance with the terms hereof shall not be less than four hundred pounds during each calendar year embraced by this lease, excepting that a reduction of thirty-three pounds from the amount thus guaranteed for each machine shall be allowed at the end of the year for each calendar month during which the factory of the lessee has remained wholly idle.

Six. The lessor may attach to the said machinery an indicator or indicators to register the number of revolutions or movements of any part or parts thereof, and the lessee shall not allow any person (other than the lessor or its agents) to disturb or interfere with such indicator or indicators. The lessee shall keep full and accurate accounts, independently of any indicators that may be placed upon

said machinery, showing the number of boots and shoes or parts thereof in the manufacture of which the said machinery or any part thereof shall be used, and shall allow the lessor at all times by its agents or attorneys to examine and to take copies of such accounts and entries of the lessee as may serve to indicate the total number of boots and shoes made by the aid of said machinery or any part thereof, and the lessee shall produce all such papers and books upon request.

Seven. This lease and license shall continue, unless sooner terminated by the lessor because of breach thereof on the part of the lessee, or otherwise as herein provided, for seventeen years from the date hereof. But if any breach or default shall be made in the observance of any one or more of the conditions or agreements herein contained or contained in any other lease or license agreement subsisting between the lessor and the lessee whether as the result of assignment to the lessor or otherwise and expressed to be obligatory upon the lessee, the lessor shall have the right by notice in writing to the lessee to terminate forthwith this lease and license and also if the lessor so elects any other lease or license agreements then in force between the lessor and the lessee whether as the result of assignment to the lessor or otherwise, and this notwithstanding that previous breaches or defaults may have been unnoticed, waived or condoned by or on behalf of the lessor. If, upon the expiration of the full term of this lease, the lessor does not request the return of the said machinery, then the said machinery shall continue to be held and used under and in accordance with the conditions of this lease and license, which shall thereupon be extended indefinitely as to term; but thereafter either the lessee or the lessor, upon sixty days' notice in writing to the other, may terminate this lease and license, whereupon the said machinery shall be delivered forthwith to the lessor, as herein provided. Upon the expiration or termination of this lease and license or any extension thereof by notice or by reason of any default on the part of the lessee as to the terms of this lease or any other lease with the lessor, or otherwise as herein provided, the lessee shall forthwith deliver the said machinery to the lessor at its office or factory in good order and condition,

reasonable wear and tear alone excepted; and the lessee for himself, his heirs, executors and administrators, hereby grants to the lessor, its successors and assigns, full right, power and authority to enter upon the premises and into any factory, room, or any place where the said machinery, or any part thereof, may be, and take possession thereof, and take away the same, and the lessee in addition and without prejudice to any other rights and remedies of the lessor hereunder, shall thereupon pay to the lessor such sum as may be necessary to put the said machinery in suitable order and condition to lease to another lessee.

Eight. A notice in writing, signed by the president, a vice-president or the treasurer of the lessor or by the assignee of the lessor's rights hereunder and posted by pre-paid letter, addressed to the lessee or delivered at his usual or last known place of abode or business, that the lease and license hereby granted is determined or shall be determined at the expiration of a certain period, shall be a sufficient determination of the lease and license from the time of posting or delivering such notice, or from the expiration of the period therein mentioned, as the case may be. Any termination of this lease and license shall not release the lessee from his obligation to pay rent for the period prior to such termination, and shall be without prejudice to any other rights or remedies which the lessor may have for violation of contract, use of machines without right, or use of patents without license.

Nine. The lessee admits the validity for the full term expressed in the grant thereof (and every extension and renewal thereof) of each and every of the letters patent of the United States of America, owned by the lessor or under which it is licensed, any of the inventions of which are or hereafter may be embodied in the said machinery or embodied in the operation thereof. The lessee also agrees that he will not directly or indirectly infringe or contest the validity for the full term expressed in the grant thereof or of any extension or renewal thereof, of any of the Letters Patent referred to in the Schedule of Patents hereto annexed or the title of the lessor thereto. The expiration of this agreement or any extension thereof or the termination or cesser of the lease and license hereby granted

shall not in any way affect the provisions of this clause, or release or discharge the lessee from the admissions and estoppels herein set forth.

Ten. None of the terms or conditions of this lease and license shall be held to have been waived by any act or knowledge of the lessor, its agents or employees, but only by an instrument in writing, signed by the president, a vice-president or the treasurer of the lessor.

Eleven. The term "lessor" shall include the said United Shoe Machinery Company and its successors and assigns. All the conditions and agreements binding on the lessee shall be binding on and enforceable against his legal representatives. In the construction of this instrument, words relating to the number and gender of the parties shall be read according to their real number and gender.

In witness whereof, the parties hereto have duly executed this instrument in duplicate, the day and year first above written.

☞ If lessee is a corporation, add seal.

PLAINTIFF'S EXHIBIT 35.

[Put in Evidence, page 381.]

Metallic Department. 900.

Lease and License Number .

This Lease and Agreement made at Boston, in the State of Massachusetts, this day of 19 , between the United Shoe Machinery Company, a corporation organized under the laws of the State of New Jersey, having an office in said Boston, hereinafter referred to as the lessor, of the one part, and of hereinafter referred to as the lessee, of the other part:

Witnesseth, that the lessor, in consideration of the covenants and agreements on the part of the lessee herein contained, does hereby lease to and license the lessee under any letters patent belonging to the lessor or under which the lessor has the right to grant such license affecting any inventions which are or hereafter shall be embodied therein or employed in the operation thereof, to use the machine or machines now or hereafter delivered to the lessee and designated by number in the following schedule, viz:—

SCHEDULE OF MACHINES.
Rapid Standard Screw Machine Co.
Knife Grinder, No.

and any parts, extras, duplicates, mechanisms, tools and devices relating thereto, or used in connection therewith, now attached to or delivered with the said designated machine or machines, or which may at any time hereafter be obtained from the lessor, or be added thereto with the consent of the lessor (the whole of which machine or machines, parts, extras, duplicates, mechanisms, tools and devices held by the lessee under these presents, whether now or hereafter delivered to or in the possession of the lessee, is hereinafter referred to as "the said machinery"), subject to the conditions hereinafter contained.

And the following are agreed to as conditions of the lease and license of the said machinery, all of which the lessee covenants and agrees to keep and perform: —

One. The said machinery shall be used only by the lessee himself, or by operatives in his direct employ, and only in the factory now occupied by him at in the State of . The said machinery shall not be transferred or delivered or sublet to another, and neither the lease nor the license hereby granted can be assigned by the lessee by his own act or by operation of law. If the lessee becomes insolvent or bankrupt, or has a receiving order made against him, or makes or executes any bill of sale, deed of trust or assignment for the benefit of his creditors, or if a sale or lease or removal of said machinery, or any part thereof, without the consent in writing of the lessor, be made or attempted, or if any distress or execution or attachment be levied thereon, then and in each such case this lease and license and any other lease or license then existing between the lessor and the lessee shall at the option of the lessor cease and determine, and the possession and full right to and control of all the said machinery, and any machinery held by the lessee under any other lease or license from the lessor, shall thereupon revest in the lessor free from all claims or demands whatsoever. The said machinery shall at all times remain and be

the sole and exclusive property of the lessor, and the lessee shall have no right of property therein, but only the right to use the same, upon the conditions herein contained.

Two. The lessor and its agents and employees shall at all times have access to the said machinery for the purpose of inspecting it or watching its use and operation, or of altering, repairing, improving, or adding to it, or determining the nature or extent of its use, and the lessee shall afford all reasonable facilities therefor.

Three. The lessee shall at all times and at his own expense keep the said machinery in good and efficient working order and condition, and shall obtain from the lessor exclusively and shall pay therefor at the regular prices from time to time established by the lessor, all the duplicate parts, extras, devices, and mechanisms of every kind needed or used in operating, repairing, or renewing the said machinery, and the lessee shall not otherwise make or allow to be made any addition, subtraction or alteration to, from, or in the said machinery, without the consent in writing of the lessor, nor interfere with the proper operation of the same. The lessee shall not permit anyone to injure or deface or remove any plate, or dates, numbers, or other inscriptions now or hereafter impressed on or affixed to the said machinery by the lessor. The lessee shall use the said machinery to its full capacity so far as the number and kind of boots and shoes made in his factory will permit, except that the lessee agrees that said machinery shall not be used in the manufacture of any boots or shoes which are lasted on machines or by the aid of lasting or tacking mechanisms other than those leased from the lessor or any welted boots or shoes which are not welted and stitched on welt sewing and sole stitching machines leased from the lessor, or turn shoes the soles of which are not attached by turn sewing machines leased from the lessor. In case the lessee has more work of the kind which can be performed by any of the machines belonging to the Metallic Department of the lessor than the capacity of the Metallic machinery which he has under lease from the lessor will permit, then the lessee shall either take from the lessor, under a like lease and agreement, sufficient additional machinery to perform the work, or in case the lessee does not thus lease additional

Metallic machinery from the lessor, then the lessor may, if it so elects, cancel forthwith this lease and any other lease of Metallic machinery then in force between the lessor and the lessee, whether as the result of assignment or otherwise. The lessee shall at his own expense insure against loss by fire and keep insured to the full value thereof the said machinery, and in case of loss shall pay forthwith to the lessor a sum equal to the full amount of the loss occasioned to the lessor.

Four. The lessee shall pay all taxes and assessments which shall be assessed in respect to the said machinery or other machinery of the lessor held by the lessee under lease or license upon whomsoever assessed. All taxes or assessments in respect to leases, licenses or agreements covering machinery, or the rights to payments thereunder, shall be construed, for the purposes of this article, to be assessed in respect to the machinery itself. In case at any time any unapportioned tax or assessment shall be assessed to the lessor in respect in part but not wholly to machinery of the lessor in the possession of the lessee the lessee shall pay to the lessor such proportionate part of the total amount of said unapportioned tax or assessment as the fair valuation, to be determined by the lessor, of said machinery of the lessor in the possession of the lessee bears to the fair valuation, to be determined by the lessor, of all machinery (excepting machinery, if any, in the lessor's own possession) in respect to which the unapportioned tax or assessment has been assessed: provided, however, that if such unapportioned tax or assessment includes any tax or assessment in respect to tangible property in the lessor's own possession the amount thereof, based, at the established rate, upon the fair valuation, to be determined by the lessor, of such property, shall first be deducted and the lessee shall pay his proportionate part as aforesaid of the balance only of said unapportioned tax or assessment after such deduction has been made.

Five. The lessee agrees, as rent or royalty for the said machinery, to purchase of the lessor at the prices established by the lessor all the fastening material used by him in or in connection with the said machinery, paying therefor in cash on delivery. The lessee

hereby guarantees that for each machine hereby leased the amount of fastening material used by him and purchased from the lessor in accordance with the terms hereof shall not be less than four hundred pounds during each calendar year embraced by this lease, excepting that a reduction of thirty-three pounds from the amount thus guaranteed for each machine shall be allowed at the end of the year for each calendar month during which the factory of the lessee has remained wholly idle.

Six. The lessor may attach to the said machinery an indicator or indicators to register the number of revolutions or movements of any part or parts thereof, and the lessee shall not allow any person (other than the lessor or its agents) to disturb or interfere with such indicator or indicators. The lessee shall keep full and accurate accounts, independently of any indicators that may be placed upon said machinery, showing the number of boots and shoes or parts thereof in the manufacture of which the said machinery or any part thereof shall be used, and shall allow the lessor at all times by its agents or attorneys to examine and to take copies of such accounts and entries of the lessee as may serve to indicate the total number of boots and shoes made by the aid of said machinery or any part thereof, and the lessee shall produce all such papers and books upon request.

Seven. This lease and license shall continue, unless sooner terminated by the lessor because of breach thereof on the part of the lessee, or otherwise as herein provided, for seventeen years from the date hereof. But if any breach or default shall be be made in the observance of any one or more of the conditions or agreements herein contained or contained in any other lease or license agreement subsisting between the lessor and the lessee whether as the result of assignment to the lessor or otherwise and expressed to be obligatory upon the lessee, the lessor shall have the right by notice in writing to the lessee to terminate forthwith this lease and license and also if the lessor so elects any other lease or license agreements then in force between the lessor and the lessee whether as the result of assignment to the lessor or otherwise, and this notwithstanding that previous breaches or defaults may have been

unnoticed, waived, or condoned by or on behalf of the lessor. If, upon the expiration of the full term of this lease, the lessor does not request the return of the said machinery, then the said machinery shall continue to be held and used under and in accordance with the conditions of this lease and license, which shall thereupon be extended indefinitely as to term; but thereafter either the lessee or the lessor, upon sixty days' notice in writing to the other, may terminate this lease and license, whereupon the said machinery shall be delivered forthwith to the lessor, as herein provided. Upon the expiration or termination of this lease and license or any extension thereof by notice or by reason of any default on the part of the lessee as to the terms of this lease or any other lease with the lessor, or otherwise as herein provided, the lessee shall forthwith deliver the said machinery to the lessor at its office or factory in good order and condition, reasonable wear and tear alone excepted; and the lessee for himself, his heirs, executors and administrators, hereby grants to the lessor, its successors and assigns, full right, power and authority to enter upon the premises and into any factory, room, or any place where the said machinery, or any part thereof, may be, and take possession thereof, and take away the same, and the lessee in addition and without prejudice to any other rights and remedies of the lessor hereunder, shall thereupon pay to the lessor such sum as may be necessary to put the said machinery in suitable order and condition to lease to another lessee.

Eight. A notice in writing, signed by the president, a vice-president or the treasurer of the lessor or by the assignee of the lessor's rights hereunder and posted by prepaid letter, addressed to the lessee or delivered at his usual or last known place of abode or business, that the lease and license hereby granted is determined or shall be determined at the expiration of a certain period, shall be a sufficient determination of the lease and license from the time of posting or delivering such notice, or from the expiration of the period therein mentioned, as the case may be. Any termination of this lease and license shall not release the lessee from his obligation to pay rent for the period prior to such termination, and shall be without prejudice to any other rights or remedies which the

lessor may have for violation of contract, use of machines without right, or use of patents without license.

Nine. The lessee admits the validity for the full term expressed in the grant thereof (and every extension and renewal thereof) of each and every of the letters patent of the United States of America owned by the lessor or under which it is licensed, any of the inventions of which are or hereafter may be embodied in the said machinery or embodied in the operation thereof. The lessee also agrees that he will not directly or indirectly infringe or contest the validity for the full term expressed in the grant thereof or of any extension or renewal thereof, of any of the Letters Patent referred to in the Schedule of Patents hereto annexed or the title of the lessor thereto. The expiration of this agreement or any extension thereof or the termination or cesser of the lease and license hereby granted shall not in way affect the provisions of this clause, or release or discharge the lessee from the admissions and estoppels herein set forth.

Ten. None of the terms or conditions of this lease and license shall be held to have been waived by any act or knowledge of the lessor, its agents or employees, but only by an instrument in writing, signed by the president, a vice-president or the treasurer of the lessor.

Eleven. The term "lessor" shall include the said United Shoe Machinery Company and its successors and assigns. All the conditions and agreements binding on the lessee shall be binding on and enforceable against his legal representatives. In the construction of this instrument, words relating to the number and gender of the parties shall be read according to their real number and gender.

In witness whereof, the parties hereto have duly executed this instrument in duplicate, the day and year first above written.

☞If lessee is a corporation, add seal.

Lasting Machine Department. [Form 302.]
Lease and License Number .
Pulling Over Machine.

This Lease and Agreement made at Boston in the State of Massachusetts this day of 19 , between the United Shoe Machinery Company, a corporation organized under the laws of the State of New Jersey, having an office in said Boston, hereinafter

referred to as the lessor, of the one part, and of in the State of , hereinafter referred to as the lessee, of the other part:

Witnesseth, that the lessor in consideration of the covenants and agreements on the part of the lessee herein contained, does hereby lease to and license the lessee under its patents to use Pulling Over Machine No. , now or hereafter delivered to the lessee, and any duplicate parts, extras, mechanisms and devices relating thereto, or used in connection therewith, now attached to or delivered with the said designated machine, or which may at any time hereafter be obtained from the lessor, or be added thereto with the consent of the lessor (which machine, together with all duplicate parts, extras, mechanisms and devices, held by the lessee under these presents, whether now or hereafter delivered to or in the possession of the lessee, is hereinafter referred to as the "leased machinery"), subject to the conditions hereinafter contained.

And that the following are agreed to as conditions of the lease and license of the leased machinery, all of which the lessee covenants and agrees to keep and perform:—

One. The leased machinery shall at all times remain and be the sole and exclusive property of the lessor, and the lessee shall have no right of property therein, but only the right to use the same, upon the conditions herein contained. The leased machinery shall be used only by the lessee himself or by operatives in his direct employ, and only in the factory now occupied by him at in the State of . The leased machinery shall not be transferred or delivered or sublet to any other person or corporation, and neither the lease nor the license hereby granted can be assigned by the lessee by his own act or by operation of law. If the lessee becomes insolvent or bankrupt, or has a receiving order made against him, or makes or executes any bill of sale, deed of trust or assignment for the benefit of his creditors, or if a sale or lease or removal of the leased machinery, or any part thereof, without the consent in writing of the lessor, be made or attempted, or if any distress or execution or attachment be levied thereon, then and in each such case this lease and license and any other lease or license then

existing between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, shall at the option of the lessor cease and determine, and the possession of and full right to and control of all the leased machinery, and any machinery held by the lessee under any other lease or license from the lessor, whether as the result of assignment to the lessor or otherwise, shall thereupon revest in the lessor free from all claims or demands whatsoever. The lessor and its agents and employees shall at all times be given access to the leased machinery for the purpose of inspecting it or watching its use and operation, or of altering, repairing, improving or adding to it, or determining the nature or extent of its use, and the lessee shall afford all reasonable facilities therefor.

Two. The lessee shall at all times and at his own expense keep the leased machinery in good and efficient working order and condition, and shall not permit anyone to injure or deface or remove any plate, or dates, numbers, or other inscriptions now or hereafter impressed on or affixed to the leased machinery by the lessor. The lessee shall obtain from the lessor exclusively, and shall pay therefor at the regular prices from time to time established by the lessor, all the duplicate parts, extras, mechanisms and devices, of every kind needed or used in operating, repairing, or renewing the leased machinery, and the same shall form part of the leased machinery, and the lessee shall not otherwise make or allow to be made any addition, subtraction or alteration to, from, or in the leased machinery without the consent in writing of the lessor, nor interfere with the proper operation of the same.

Three. The lessee shall at his own expense insure the leased machinery against loss by fire, and keep the same insured to the amount of Three Hundred (300) Dollars, and in case the same is lost or destroyed by fire or otherwise before the expiration or termination of this lease, then the lessee shall pay to the lessor upon demand the sum of Three Hundred (300) Dollars as partial compensation for such loss or destruction. The lessee shall pay all taxes and assessments which shall be levied in respect to the leased machinery or in respect to this lease and license or the right to payments hereunder upon whomsoever assessed.

Four. The lessee shall use the leased machinery to its full capacity on all boots, shoes, and other footwear made in his factory in the manufacture of which it can be used, but the leased machinery shall not, nor shall any part thereof, be used in the manufacture of any boots, shoes or other footwear which are or are to be welted, or the soles of which are to be stitched or attached to their uppers by welting or stitching or sewing machines not leased to the lessee by the lessor or its assignors, or in the manufacture of any boots, shoes or other footwear which have been, or shall be lasted otherwise than by machines and devices held by the lessee under lease from the lessor or in the manufacture of any boots, shoes or other footwear which have been or shall be pegged, slugged, heel seat nailed, or otherwise partly made by the aid of any pegging or "metallic" machinery not leased to the lessee by the lessor or its assignors, or in the manufacture of any boots, shoes or other footwear, the heels of which are to be compressed or prepared in whole or in part or shall be attached by any "heeling" machinery not leased to the lessee by the lessor or its assignors. In case at any time the lessee has more work of the kind which can be performed by the leased machinery than the leased machinery and other like machinery held by him under lease from the lessor is sufficient to perform, the lessee shall take from the lessor under the regular lease and license then in use by the lessor for such machines sufficient additional machinery to perform all of such work.

Five. The lessee shall pay to the lessor on the last day of each calendar month as rent or royalty the sum of one half of one cent for each pair of boots, shoes or other footwear or portions thereof, manufactured or prepared during the next preceding calendar month in any way, whether wholly or in part, by the aid of the leased machinery or any part thereof: **provided, however, that in all cases when the lessee shall pay to the lessor on or before the fifteenth day of the calendar month the rent or royalty due for the use of the leased machinery for the next preceding calendar month, the lessor will in consideration of such prompt payment grant a discount of fifty per cent. from such rent or royalty due**

for such preceding calendar month. The lessee guarantees that the rent or royalty herein provided (less all abatements) shall amount in each calendar year to at least fifteen (15) dollars for each calendar month and at the end of each calendar year the lessee shall pay to the lessor the amount, if any, by which the rent or royalty paid for said year is less than such guaranteed rent or royalty: provided, however, that if in any calendar year the factory of the lessee remains wholly idle for any entire calendar month, then the amount of rent or royalty guaranteed for that year shall be reduced by one twelfth for each such month that the factory thus remains wholly idle.

Six. The lessor may attach to the leased machinery, or any thereof, an indicator or indicators to register the number of revolutions or movements of any part or parts thereof, and the lessee shall not allow any person (other than the lessor or its agents) to disturb or interfere with such indicator or indicators. In case any indicator thus attached shall from any cause cease to correctly indicate or register, or shall be disturbed or out of repair, or if the glass covering any such indicator shall be removed or broken or injured, then and as often as the same shall happen the lessee shall immediately by writing notify the lessor and at the same time explain the circumstances under which the same has happened. In case any such indicator ceases to indicate, or becomes or remains inaccurate, or the glass covering becomes or remains removed, broken, or injured, because of any fault of the lessee or any one in his employ, or because of the failure of the lessee to give promptly the notice hereinbefore provided for, then, without prejudice to any other rights of the lessor hereunder, the lessee shall pay the lessor as rent or royalty, without the right to any discount, one half of one cent per pair for each pair of boots, shoes, or other footwear, or portions thereof, in the manufacture of which the leased machinery or any part thereof shall have been used. The lessee shall keep full and accurate accounts, independently of any indicators that may be placed upon the leased machinery, showing the number of boots, shoes, and other footwear, or portions thereof, in the manufacture of which the leased machinery or any part thereof shall

have been used, and shall allow the lessor at all times, by its agents or attorneys, to examine and to take copies of such accounts and entries of the lessee as may serve to determine the total number of boots, shoes, or other footwear or portions thereof made by the aid of the leased machinery or any part thereof, and the lessee shall produce all such accounts and entries upon request. The lessee shall require each of his operators upon the leased machinery or any part thereof to keep upon blanks or blank books to be furnished by the lessor accurate daily records of the number of boots, shoes, and other footwear, or portions thereof, in the making of which he has used the leased machinery or any part thereof, and shall require his operators to sign such records, and if requested so to do by the lessor, shall verify the same under oath. The lessee shall send to the office of the lessor in Boston on or before the fifth day of each calendar month, the original records for the next preceding calendar month kept by his operators as above provided for; and in case, in any calendar month, none of the leased machinery has been used, the lessee shall notify the lessor in writing of that fact, on or before the fifth day of the next succeeding calendar month. The lessee shall also furnish any further information which may be called for in relation to the leased machinery or the use thereof.

And that the following agreements, stipulations and provisions are agreed to: —

Seven. This lease and license shall continue, unless sooner terminated by the lessor because of breach thereof on the part of the lessee, or otherwise as herein provided, for seventeen years from the date hereof. But if any breach or default shall be made in the observance of any one or more of the conditions herein contained or contained in any other lease or license agreement subsisting between the lessor and the lessee whether as the result of assignment to the lessor or otherwise and expressed to be obligatory upon the lessee, the lessor shall have the right by notice in writing to the lessee to terminate forthwith this lease and license, and also if the lessor so elects any other lease or license agreements then in force between the lessor and the lessee, whether as the

result of assignment to the lessor or otherwise, and this notwithstanding that previous breaches or defaults may have been unnoticed, waived, or condoned by or on behalf of the lessor. If, upon the expiration of the full term of this lease, the lessor does not request the return of the leased machinery, then the leased machinery shall continue to be held and used under and in accordance with the conditions of this lease and license, which shall thereupon be extended indefinitely as to term; but thereafter either the lessee or the lessor, upon sixty days' notice in writing to the other, may terminate this lease and license, whereupon the leased machinery shall be delivered forthwith to the lessor, as herein provided. Upon the expiration of this lease and license or any extension thereof or its termination by notice or by reason of any default on the part of the lessee as to the terms of this lease and license or any other lease or license from the lessor, or otherwise as herein provided, the lessee shall forthwith deliver the leased machinery to the lessor at its office or factory in good order, reasonable wear and tear alone excepted, and shall thereupon pay to the lessor the sum of Two Hundred Dollars ($200) as compensation for setting up the leased machinery in his factory, for instructing operators and for deterioration of the leased machinery; and the lessee for himself, his heirs, executors, and administrators, hereby grants to the lessor, its successors, and assigns, full right, power and authority to enter upon the premises and into any factory, room, or any place where the leased machinery, or any part thereof, may be, and take possession thereof, and take away the same.

Eight. A notice in writing, signed by the president, a vice-president, or the treasurer of the lessor or by any assignee of the lessor's rights hereunder and posted by prepaid letter, addressed to the lessee or delivered at his usual or last known place of abode or business, that the lease and license hereby granted is determined or shall be determined at the expiration of a certain period, shall be a sufficient determination of the lease and license from the time of posting or delivering such notice, or from the expiration of the period therein mentioned, as the case may be. Any termination

of this lease and license shall not release the lessee from his obligation to pay rent or royalty for the period prior to such termination and shall be without prejudice to any other rights or remedies which the lessor may have for violation of contract, use of machines without right or use of patented inventions without license.

Nine. The lessee admits the validity of each and every of the Letters Patent of the United States of America, owned by the lessor or under which it is licensed, any of the inventions of which are or hereafter may be embodied in the leased machinery. The lessee also agrees that he will not directly or indirectly infringe or contest the validity of or the title of the lessor to any of the patents referred to in the "Schedule of Patents" hereto annexed. The termination or cessor of this lease and license from any cause whatever shall not in any way affect the provisions of this clause, or release or discharge the lessee from the admission and estoppel herein set forth.

Ten. None of the terms or conditions of this lease and license shall be held to have been waived by any act or knowledge of the lessor, its agents or employees, but only by an instrument in writing, signed by the president, a vice-president, or the treasurer of the lessor.

Eleven. The term "lessor" shall include the said United Shoe Machinery Company and its successors and assigns. All the conditions and agreements binding on the lessee shall be binding on and enforceable against his legal representatives. In the construction of this instrument, words relating to the number and gender of the parties shall be read according to their real number and gender.

In witness whereof, the parties hereto have duly executed this instrument in duplicate, the day and year first above written.

☞ If lessee is a corporation, add corporate seal.

Pulling Over System. [Form J. P. A. 105.]

License and Lease Number .

Pulling Over System.

This Lease and Agreement made at Boston, in the State of Massachusetts, this day of 19 , between the United Shoe Machinery Company, a corporation organized under the laws of the State of New Jersey, having an office in said Boston, hereinafter referred to as the lessor, of the one part, and of in the State of , hereinafter referred to as the lessee, of the other part:

Witnesseth, that the lessor, in consideration of the covenants and agreements on the part of the lessee herein contained, does hereby lease to and license the lessee under its patents to use, subject to the conditions, stipulations and provisions hereinafter contained, the machine or machines designated by number or numbers in the following schedule, viz.: —

SCHEDULE OF MACHINES.

Class A.	I.
Rex Pulling Over Machine, No. . .	$300.
Class B.	
Rex Pounding Machine, No. . .	125.
Rex Toe Gumming Machine, No. . .	75.
Rex Toe Trimming Machine, No. . .	50.
Rex Assembling Spindle, No. . .	10.
Rex Strip Tacker, No. . . .	10.
Rex Tacker Support, No. . . .	5.

and any duplicate parts, extras, mechanisms and devices relating thereto, or used in connection therewith, now attached to or delivered with the said designated machine or machines, or which may at any time hereafter be obtained from the lessor, or be added thereto by or with the consent of the lessor.

The term the "principal machinery hereby leased" wherever used herein shall be construed to include the whole of the machine or machines hereby leased included in Class A in the foregoing schedule, together with all duplicate parts, extras, mechanisms and devices relating thereto held by the lessee under these presents, whether now or hereafter delivered to or in the possession of the lessee.

The term the "auxiliary machinery hereby leased" wherever used herein shall be construed to include the whole of the machine or machines hereby leased included in Class B in the foregoing schedule, together with all duplicate parts, extras, mechanisms and devices relating thereto held by the lessee under these presents, whether now or hereafter delivered to or in the possession of the lessee.

The term the "leased machinery" wherever used herein shall be construed to include both the "principal machinery hereby leased" and the "auxiliary machinery hereby leased."

And that the following are agreed to as conditions of the lease and license of the leased machinery, all of which the lessee covenants and agrees to keep and perform: —

One. The leased machinery shall at all times remain and be the sole and exclusive property of the lessor, and the lessee shall have no right of property therein but only the right to use the same, upon the conditions herein contained. The leased machinery shall be used only by the lessee himself or by operatives in his direct employ, and only in the factory now occupied by him at in the the State of unless the lessor shall by an instrument in writing signed by its president, vice-president or treasurer authorize the lessee to remove the leased machinery and to use the same elsewhere. The leased machinery shall not be transferred or delivered or sublet to any other person or corporation, and neither the lease

nor the license hereby granted can be assigned by the lessee by his own act or by operation of law. If the lessee becomes insolvent or bankrupt, or has a receiving order made against him, or makes or executes any bill of sale, deed of trust or assignment for the benefit of his creditors, or if a sale, mortgage, lease or unauthorized removal of the leased machinery, or any part thereof, be made or attempted, or if any distress or execution or attachment be levied thereon, then and in each such case any or all leases of and licenses to use machinery then existing between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, shall at the option of the lessor cease and determine, and the possession of and full right to and control of all machinery of the lessor the lease or license of which is so terminated shall thereupon revest in the lessor free from all claims and demands whatsoever. The lessor and its agents and employees shall at all times be given access to the leased machinery for the purpose of inspecting it or watching its use and operation, or of altering, repairing, improving, or adding to it, or determining the nature or extent of its use, and the lessee shall afford all reasonable facilities therefor.

Two. The lessee shall at all times and at his own expense keep the leased machinery in good and efficient working order and condition, and shall not permit any one to injure or deface or remove any plate, or dates, numbers, or other inscriptions now or hereafter impressed on or affixed to the leased machinery by the lessor. The lessee shall obtain from the lessor exclusively, and shall pay therefor at the regular prices from time to time established by the lessor, all the duplicate parts, extras, mechanisms and devices of every kind needed or used in operating, repairing, or renewing the leased machinery, and the same shall form part of the leased machinery, and the lessee shall not otherwise make or allow to be made any addition, subtraction or alteration to, from, or in the leased machinery, nor interfere with the proper operation of the same.

Three. The leased machinery shall at all times until the expiration or termination of this lease and license and the redelivery of the leased machinery into the possession of the lessor, as herein-

after provided, be held at the sole risk of the lessee from injury, loss or destruction, and in case any machine or machines hereby leased shall be lost or destroyed by fire or otherwise before such expiration or termination and redelivery, the lessee as partial reimbursement to the lessor for such loss or destruction, shall pay to the lessor in respect to each machine so lost or destroyed the sum set opposite the name of such machine in the column numbered "I" in the schedule of machines hereinbefore contained, and shall forthwith return whatever remains of the machinery so lost or destroyed to the lessor, at Beverly, Mass.

Four. The lessee shall pay all taxes and assessments which shall be assessed in respect to the leased machinery or other machinery of the lessor held by the lessee under lease and license, upon whomsoever assessed. All taxes or assessment in respect to leases, licenses or agreements covering machinery, or the rights to payments thereunder, shall be construed for the purposes of this Article, to be assessed in respect to the machinery itself. In case at any time any unapportioned tax or assessment shall be assessed to the lessor in respect in part, but not wholly, to machinery of the lessor in the possession of the lessee, the lessee shall pay to the lessor such proportionate part of the total amount of said unapportioned tax or assessment as the fair valuation to be determined by the lessor, of said machinery of the lessor in the possession of the lessee bears to the fair valuation to be determined by the lessor, of all machinery (excepting machinery, if any, in the lessor's own possession) in respect to which the unapportioned tax or assessment has been assessed; provided, however, that if such unapportioned tax or assessment includes any tax or assessment in respect to tangible property in the lessor's own possession the amount thereof, based, at the established rate, upon the fair valuation, to be determined by the lessor, of such property, shall first be deducted and the lessee shall pay his proportionate part as aforesaid of the balance only of said unapportioned tax or assessment after such deduction has been made.

Five. The lessee shall use the principal machinery hereby leased to its full capacity upon all boots, shoes and other footwear or por-

tions thereof made by him in the manufacture of which it is capable of being used and in case at any time the lessee has more work of the kind which the principal machinery hereby leased is capable of performing than such machinery held by him under lease from the lessor is sufficient to perform the lessee shall take from the lessor under the printed form of lease and license agreement then in use by the lessor or machinery for doing such work sufficient additional machinery to perform all of such work. The auxiliary machinery hereby leased shall be used only in the manufacture of boots, shoes or other footwear which have been or shall be pulled over by Pulling Over Machines held by the lessee under lease from the lessor.

Six. The leased machinery shall not nor shall any thereof be used in the manufacture of any welted boots, shoes or other footwear, which have been or shall be welted in whole or in part or the soles of which have been or shall be in whole or in part stitched or attached by the aid of any welting or sewing or stitching machinery not held by the lessee under lease from the lessor; or in the manufacture of any turned boots, shoes or other footwear the soles of which have been or shall be in whole or in part attached by the aid of any sewing or attaching machinery not held by the lessee under lease from the lessor; or in the manufacture of any boots, shoes or other footwear which have or shall be lasted otherwise than by Consolidated Hand Method Lasting Machines held by the lessee under lease from the lessor; or which have been or shall be pegged, slugged, heel seat nailed or otherwise partly made by the aid of any pegging or metallic machinery not held by the lessee under lease from the lessor, or the heels of which have been or shall be compressed or prepared by the lessee in whole or in part or shall be attached by the aid of any heeling machinery not held by the lessee under lease from the lessor.

Seven. The lessee shall pay to the lessor the sum of one (1) cent in respect to each pair of boots, shoes or other footwear or portions thereof made by or for him during the continuance of this lease and license of the kind upon which it is provided in Article Five hereof the principal machinery hereby leased shall be used. Pay-

ment as herein provided shall be made on the last day of each calendar month in respect to all such boots, shoes or other footwear or portions thereof made by or for the lessee during the next preceding calendar month: **provided, however, that in all cases when the lessee shall pay to the lessor on or before the fifteenth day of the calendar month the amount due in accordance with this Article hereof for the next preceding calendar month, the lessor will in consideration of such prompt payment grant a discount of fifty per cent. from the amount so due for such preceding calendar month.** All payments in this agreement provided for are independent of and in addition to all payments provided for in any other leases or licenses or agreements between the lessor and the lessee, excepting, however, that in case at the date of these presents the lessee has under other Pulling Over System lease and license agreements from the lessor one or more "Rex Pulling Over" Machines, in addition to the "Rex Pulling Over" Machine or Machines hereby leased then payment under and in accordance with this Article hereof in respect to any pair of boots, shoes, or other footwear, shall relieve the lessee from his obligation to make like payment in respect to that pair of boots, shoes or other footwear under the Article of such other Pulling Over System lease and license agreement or agreements corresponding to this Article hereof. The lessee, however, guarantees that the payments made by him in accordance with the terms of this Article hereof or of like terms contained in other Pulling Over System lease and license agreements between the lessor and the lessee, based upon the number of boots, shoes or other footwear of the kind referred to in Article Five hereof made by or for him shall amount in each calendar year (after deducting all abatements), to at least Twenty (20) Dollars for each calendar month for each "Rex Pulling Over" Machine held by the lessee under lease from the lessor, and at the end of each calendar year the lessee shall pay to the lessor the amount, if any, by which the total of such payments for said year have been less than such guaranteed amount: provided, however, that if in any calendar year the factory of the lessee remains wholly idle for any entire calendar month, then the amount guaranteed for that

year hereunder shall be reduced by one-twelfth for each such month that the factory thus remains wholly idle, but such reduction shall not be made in respect to more than ten (10) months out of any twelve (12) consecutive calendar months.

Eight. The lessor may attach to the leased machinery, or any thereof, an indicator or indicators to register the number of revolutions or movements of any part or parts thereof, and the lessee shall not allow any person (other than the lessor or its agent) to disturb or interfere with such indicator or indicators. In case any indicator thus attached shall from any cause cease to correctly indicate or register, or shall be disturbed or out of repair, or if the glass covering any such indicator shall be removed or broken or injured, then, and as often as the same shall happen, the lessee shall immediately, by writing, notify the lessor and at the same time explain the circumstances under which the same has happened. In case any such indicator ceases to indicate, or becomes or remains inaccurate, or the glass covering becomes or remains removed, broken or injured because of any fault of the lessee or any one in his employ, or because of the failure of the lessee to give promptly the notice hereinbefore provided for, then, without prejudice to any other rights of the lessor, the lessee shall pay the lessor (without the right to any discount) the sum of two cents per pair for each pair of boots, shoes or other footwear, or portions thereof, in the manufacture of which the leased machinery or any part thereof shall have been used. The lessee shall keep full and accurate accounts, independently of any indicators that may be placed upon the leased machinery, showing the number of boots, shoes and other footwear, or portions thereof, made by or for him of the kind upon which the principal machinery hereby leased is capable of being used, and shall allow the lessor at all times, by its agents or attorneys, to examine and to take copies of such accounts and entries of the lessee as may serve to determine the total number of such boots, shoes or other footwear, or portions thereof, and the lessee shall produce all such accounts and entries upon request. The lessee shall require each of his operators upon the principal machinery hereby leased (and also if so requested by the lessor

upon the auxiliary machinery hereby leased), or any part thereof, to keep upon blanks or blank books to be furnished by the lessor accurate daily records of the number of boots, shoes and other footwear, or portions thereof, in the manufacture of which he has used said machinery, or any part thereof, and shall require his operators to sign such records, and, if requested so to do by the lessor, shall verify the same under oath. The lessee shall send to the office of the lessor in Boston, on or before the fifth day of each calendar month, the original records for the next preceding calendar month kept by his operators as above provided for; and in case, in any calendar month, any one or more of the machines hereby leased has been entirely idle the lessee, on or before the fifth day of the next succeeding calendar month, shall send to the office of the lessor in Boston the blank for such machine or machines for said month marked "not in use" and signed by the lessee. The lessee shall also furnish any further information which may be called for in relation to the leased machinery or the use thereof.

And that the following stipulations and provisions are agreed to:—

Nine. If at any time the lessee shall fail or cease to use exclusively pulling over machinery held by him under lease from the lessor for pulling over all boots, shoes or other footwear made by or for him, which are pulled over by the aid of machinery, or which are of the kind upon which the principal machinery hereby leased is capable of being used, the lessor, although it may have waived or ignored prior instances of such failure or cessation, may at its option terminate forthwith by notice in writing any or all leases or licenses of machinery, then existing between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, and the possession of and full right to and control of all machinery the lease or license of which is so terminated, shall thereupon revest in the lessor free from all claims and demands whatsoever.

Ten. This lease and license shall continue, unless sooner terminated by the lessor as herein provided, for seventeen years from the

date hereof. But if any breach or default shall be made in the observance of any one or more of the conditions, stipulations or provisions herein contained or contained in any other lease or license agreement subsisting between the lessor and the lessee whether as the result of assignment to the lessor or otherwise and expressed to be obligatory upon the lessee, the lessor shall have the right by notice in writing to the lessee to terminate forthwith any or all leases of or licenses to use machinery then in force between the lessor and the lessee whether as the result of assignment to the lessor or otherwise, and this notwithstanding that previous breaches or defaults may have been unnoticed, waived or condoned by or on behalf of the lessor. If, upon the expiration of the full term of this lease and license, the lessor does not request the return of the leased machinery, then the leased machinery shall continue to be held and used under and in accordance with the conditions, stipulations and provisions of this lease and license, which shall thereupon be extended indefinitely as to term; but thereafter either the lessee or the lessor, upon sixty days' notice in writing to the other, may terminate this lease and license, whereupon the leased machinery shall be delivered forthwith to the lessor, as herein provided. Upon the expiration or termination of this lease and license or any extension thereof the lessee shall forthwith deliver the leased machinery to the lessor at Beverly, Massachusetts, in good order, reasonable wear and tear alone excepted; and shall thereupon pay to the lessor without prejudice to any other rights or remedies of the lessor such sum as may be necessary to put the leased machinery in suitable order and condition to lease to another lessee, including the cost of all parts replaced at the regular prices established by the lessor therefor. The lessee for himself, his heirs, executors and administrators, successors and assigns, hereby grants to the lessor, its successors and assigns, full right, power and authority without prejudice to any other rights or remedies of the lessor to enter upon the premises and into any factory, room, or any place where the leased machinery, or any part thereof, may be, and take possession thereof, and take away the same.

Eleven. Upon the expiration or termination of this lease and

license or any extension thereof the lessee, in addition to all other payments in this agreement provided for and without prejudice to any other rights or remedies of the lessor, shall pay to the lessor in respect to each "Rex Pulling Over" machine hereby leased the sum of two hundred dollars ($200.00) as partial reimbursement to the lessor for deterioration of the leased machinery, expenses in connection with the installation thereof and instruction of operators.

Twelve. In case the lessee, at any time, shall have in his factory more machines adapted for doing the same work as any auxiliary machine or machines hereby leased, than in the opinion of the lessor are sufficient for performing the work which the lessee has in his factory, based upon the capacity of such machines and the number and kind of boots, shoes and other footwear made by the lessee for any period of twelve (12) consecutive months next preceding, the lessor may, at its option, upon thirty (30) days' notice in writing to the lessee, terminate the lease and license herein contained in respect to such of the said auxiliary machines hereby leased as in the opinion of the lessor are unnecessary. The termination under the provisions of this Article of the lease of or license to use any one or more of the machines hereby leased shall not affect the lease or license herein contained in respect to any other machine or machines.

Thirteen. In case at any time any of the leased machinery shall not, in the opinion of the lessor, be in good and efficient working order and condition, the lessor without prejudice to any other of its rights or remedies may give written notice to the lessee to put such machinery in good and efficient working order and condition and to replace all broken or missing parts; and in case the lessee does not within fifteen (15) days from the date of such notice comply with the requirements thereof, as herein set forth, the lessor may cause such machinery to be put in such good and efficient working order and condition, and may supply such broken or missing parts, and the lessee shall forthwith pay to the lessor the expense of making such repairs and the cost at the regular prices established by the lessor therefor of all parts so supplied.

Fourteen. A notice in writing, signed by the president, a vice-

president, the treasurer or the assistant treasurer of the lessor or by any assignee of the lessor's rights hereunder, and posted by prepaid letter, addressed to the lessee or delivered at his usual or last known place of abode or business, that the lease and license hereby granted is terminated or shall be terminated at the expiration of a certain period, shall be a sufficient termination of the lease and license from the time of posting or delivering such notice, or from the expiration of the period therein mentioned, as the case may be. Any termination of this lease and license shall be without prejudice to any rights or remedies which the lessor may have for violation of contract, use of machines without right, use of patented inventions without license or otherwise.

Fifteen. The lessee admits the validity for the full term expressed in the grant thereof (and every extension and renewal thereof) of each and every of the Letters Patent of the United States of America, owned by the lessor or under which it is licensed, any of the inventions of which are or hereafter may be embodied in the leased machinery. The lessee also agrees that he will not directly or indirectly infringe or contest the validity for the full term expressed in the grant thereof or of any extension or renewal thereof, of any of the Letters Patent referred to in the "Schedule of Patents" hereto annexed or any of the inventions of which are now or shall hereafter be embodied in the leased machinery or the title of the lessor thereto. The termination or cesser of this lease and license or any extension thereof shall not in any way affect the provisions of this Article, or release or discharge the lessee from the admissions and estoppel herein set forth.

Sixteen. None of the conditions, stipulations or provisions, of this lease and license shall be held to have been waived by any act or knowledge of the lessor, its agents or employees, but only by an instrument in writing, signed by the president, a vice-president, or the treasurer of the lessor.

Seventeen. The term "lessor" shall include the said United Shoe Machinery Company and its successors and assigns. All the conditions, stipulations and provisions binding on the lessee shall be binding on and enforceable against his legal representatives. In

the construction of this instrument, words relating to the number and gender of the parties shall be read according to their real number and gender.

In witness whereof, the parties hereto have duly executed this instrument in duplicate, the day and year first above written.

Pulling Over System. [Form A. E. E. 1095.]

Lease and License Number .
Pulling Over System.

This Agreement made at Boston, in the State of Massachusetts, this day of 19 , between the United Shoe Machinery Company, a corporation organized under the laws of the State of New Jersey, having an office in said Boston, hereinafter referred to as the lessor, of the one part, and of in the State of , hereinafter referred to as the lessee, of the other part:

Witnesseth, that the lessor, in consideration of the covenants

and agreements on the part of the lessee herein contained, does hereby lease to and license the lessee under any letters patent belonging to the lessor or under which the lessor has the right to grant such license affecting any inventions which are now or hereafter shall be embodied therein or employed in the operation thereof, to use the machine or machines designated by number or numbers in the following schedule, viz:—

SCHEDULE OF MACHINES.

	I.	II.	III.	IV.	V.
Rex Pulling Over Machine, No.	–	$10.	$300.	$200.	$5.
Rex Toe Gumming Machine, No.	¼c.	4.	75.	50.	2.
Rex Assembling Machine, No.	¼c.	4.	100.	65.	2.
Rex Pounding Machine, No.	¼c.	4.	125.	85.	2.
Rex Toe Trimming Machine, No.	¼c.	4.	50.	35.	2.
Rex Rotary Pounding and Trimming Machine, No.	¼c.	4.	150.	100.	2.
Rex Upper Trimming Machine, No.	¼c.	4.	50.	35.	2.
Rex Upper Trimmer Grinding Machine, No.	–	–	25.	15.	–
Rex Rotary Knife Grinding Machine, No.	–	–	25.	15.	–

and any duplicate parts, extras, mechanisms and devices relating thereto, or used in connection therewith, now attached to or delivered with the said designated machine or machines or which may at any time hereafter be obtained from the lessor, or be added thereto by or with the consent of the lessor (the whole of which machine or machines, duplicate parts, extras, mechanisms and devices held by the lessee under these presents, whether now or hereafter delivered to or in the possession of the lessee, is hereinafter referred to as the "leased machinery"), subject to the conditions hereinafter contained.

And that the following are agreed to as conditions of this agreement, all of which the lessee covenants and agrees to keep and perform:—

One. The leased machinery shall at all times remain and be the

sole and exclusive property of the lessor, and the lessee shall have no right of property therein, but only the right to use the same, upon the conditions herein contained. The leased machinery shall be used only by the lessee himself or by operatives in his direct employ, and only in the factory now occupied by him at in the State of unless the lessor shall by an instrument in writing signed by its president, vice-president or treasurer authorize the lessee to remove the leased machinery and to use the same elsewhere. The leased machinery shall not be transferred or delivered or sublet to any other person or corporation, and neither this agreement nor the lease nor the license hereby granted can be assigned by the lessee by his own act or by operation of law. If the lessee becomes insolvent or bankrupt, or has a receiving order made against him, or makes or executes any bill of sale, deed of trust or assignment for the benefit of his creditors, or if a sale, mortgage, lease or unauthorized removal of the leased machinery, or any part thereof, be made or attempted, or if any distress or execution or attachment be levied thereon, then and in each such case any or all leases of and licenses to use machinery then existing between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, shall at the option of the lessor cease and determine, and the possession of and full right to and control of all machinery the lease or license of which is so terminated shall thereupon revest in the lessor free from all claims and demands whatsoever. The lessor and its agents and employees shall at all times be given access to the leased machinery for the purpose of inspecting it or watching its use and operation, or of altering, repairing, improving, or adding to it, or determining the nature or extent of its use, and the lessee shall afford all reasonable facilities therefor.

Two. The lessee shall at all times and at his own expense keep the leased machinery in good and efficient working order and condition, and shall not permit any one to injure or deface or remove any plate, or dates, numbers, or other inscriptions now or hereafter impressed on or affixed to the leased machinery by the lessor. The lessee shall obtain from the lessor exclusively, and shall pay therefor at the regular prices from time to time established by the lessor,

all the duplicate parts, extras, mechanisms and devices, of every kind needed or used in operating, repairing or renewing the leased machinery, and the same shall form part of the leased machinery, and the lessee shall not otherwise make or allow to be made any addition, subtraction or alteration to, from, or in the leased machinery, nor interfere with the proper operation of the same.

Three. The leased machinery shall at all times, until the expiration or termination of this lease and license and the redelivery of the leased machinery into the possession to the lessor, as hereinafter provided, be held at the sole risk of the lessee from injury, loss, or destruction, and in case any machine or machines hereby leased shall be destroyed by fire or otherwise before such expiration or termination and redelivery, the lessee as partial reimbursement to the lessor for such loss or destruction, shall pay to the lessor in respect to each machine so destroyed the sum set opposite the name of such machine in the column numbered "III." in the schedule of machines hereinbefore contained, and shall forthwith return whatever remains of the machinery so destroyed to the lessor, at Beverly, Massachusetts.

Four. The lessee shall pay all taxes and assessments which shall be assessed in respect to the leased machinery or other machinery of the lessor held by the lessee under lease or license upon whomsoever assessed. All taxes or assessments in respect to leases, licenses or agreements covering machinery, or the rights to payments thereunder, shall be construed, for the purposes of this article, to be assessed in respect to the machinery itself. In case at any time any unapportioned tax or assessment shall be assessed to the lessor in respect in part but not wholly to machinery of the lessor in the possession of the lessee, the lessee shall pay to the lessor such proportionate part of the total amount of said unapportioned tax or assessment as the fair valuation, to be determined by the lessor, of said machinery of the lessor in the possession of the lessee bears to the fair valuation, to be determined by the lessor, of all machinery (excepting machinery, if any, in the lessor's own possession) in respect to which the unapportioned tax or assessment has been assessed; provided, however, that if such unapportioned tax

or assessment includes any tax or assessment in respect to tangible property in the lessor's own possession the amount thereof, based, at the established rate, upon the fair valuation, to be determined by the lessor, of such property, shall first be deducted and the lessee shall pay his proportionate part as aforesaid of the balance only of said unapportioned tax or assessment after such deduction has been made.

Five. The machinery hereby leased or held by the lessee under other lease or license agreement from the lessor shall be used only in the manufacture or preparation of boots, shoes or other footwear made by or for the lessee and shall be used for no other purpose than for performing the work for which it is designed and leased. The machinery of the Pulling Over System of the lessor hereby leased or held by the lessee under other lease or license agreement from the lessor shall not nor shall any thereof be used in the manufacture of any welted boots, shoes or other footwear which have been or shall be welted in whole or in part or the soles of which have been or shall be in whole or in part stitched or attached by the aid of any welting or sewing or stitching machinery not held by the lessee under lease from the lessor; or in the manufacture of any turned boots, shoes or other footwear the soles of which have been or shall be in whole or in part attached by the aid of any sewing or attaching machinery not held by the lessee under lease from the lessor; or in the manufacture of any boots, shoes or other footwear which have been or shall be lasted in any way whether in whole or in part otherwise than by lasting machines held by the lessee under lease from the lessor; or which have been or shall be pegged, slugged, heel seat nailed or otherwise partly made by the aid of any pegging or metallic machinery not held by the lessee under lease from the lessor, or the heels of which have been or shall be compressed or prepared by the lessee in whole or in part or shall be attached by the aid of any heeling machinery not held by the lessee under lease from the lessor; or in the manufacture of any boots, shoes or other footwear upon which any operation for which any of the machines of the lessor mentioned by name in the foregoing schedule of machines are designed, has been or is to be

performed by machinery not held by the lessee under lease from the lessor. Subject to the foregoing limitations, the lessee shall use all Rex Pulling Over Machines held by him under lease from the lessor to their full capacity upon all boots, shoes or other footwear or portions thereof made by or for the lessee in the manufacture or preparation of which such machines are capable of being used, and shall use all other machinery of the Pulling Over System of the lessor held by him under lease from the lessor to its full capacity upon all work in the manufacture or preparation of boots, shoes and other footwear, or portions thereof, which is done by or for the lessee by the aid of machinery and which is of a kind which such machinery is designed to perform.

Six. The lessee throughout the full term of this agreement shall pay to the lessor the sum of one-half of one cent in respect to each pair of boots, shoes or other footwear or portions thereof made by or for him which are pulled over in any way, whether wholly or in part, by the aid of machinery. The lessee shall also, during the continuance of the lease hereby granted or any lease heretofore granted to the lessee covering any one or more machines of the lessor of a kind or kinds mentioned by name in the foregoing schedule of machines, pay to the lessor in respect to each pair of boots, shoes or other footwear or portions thereof in the manufacture or preparation of which any such machine or machines are used, the amount in respect to each machine so used set opposite the name of such machine in Column I. of said schedule. Payments as herein provided shall be made on the last day of each calendar month in respect to all such boots, shoes or other footwear or portions thereof operated upon during the next preceding calendar month; provided, however, that in case the lessee shall use lasting and tacking machinery, mechanisms and appliances held by him under lease from the lessor for doing all work in the manufacture of all boots, shoes and other footwear, or portions thereof, made by or for him which is done by the aid of lasting or tacking machinery, mechanisms or appliances, then the total amount to be paid by the lessee to the lessor for any calendar month under the foregoing provisions of this article shall not exceed a maximum amount computed at the rate of three-quarters of one

cent for each pair of all boots, shoes or other footwear, or portions thereof, lasted by or for the lessee, during said month; **and provided, also, that in all cases when the lessee shall pay to the lessor on or before the fifteenth day of the calendar month the amount due in accordance with this Article hereof for the next preceding calendar month, the lessor will, in consideration of such prompt payment, grant a discount of fifty per cent. from the amount so due for such preceding calendar month.** All payments in this agreement provided for are independent of and in addition to all payments provided for in any other leases or licenses or agreements between the lessor and the lessee, excepting, however, that in case at the date of these presents the lessee has under other Pulling Over System lease and license agreements from the lessor one or more machines of a kind or kinds mentioned by name in the foregoing Schedule of Machines, then payment under and in accordance with this Article hereof in respect to any pair of boots, shoes or other footwear shall relieve the lessee from his obligation to make like payment in respect to that pair of boots, shoes or other footwear under the Article of such other Pulling Over System lease and license agreement or agreements corresponding to this Article hereof. The lessee, however, guarantees that the payments made by him in accordance with this Article hereof in respect to each machine of a kind or kinds mentioned by name in the foregoing Schedule of Machines held by the lessee under this agreement or under any other lease or license agreement or agreements from the lessor shall amount, in each calendar year (after deducting all abatements), to at least the amount for each calendar month for each machine set opposite the name of such machine in Column II. of said schedule, and at the end of each calendar year the lessee shall pay to the lessor the amount, if any, by which the payments for said year have been less than such guaranteed amount: provided, however, that if in any calendar year the factory of the lessee remains wholly idle for any entire calendar month, then the amount guaranteed for that year hereunder shall be reduced by one-twelfth for each such month that the factory thus remains wholly idle, but such reduction shall not be made in respect to more than

ten (10) months out of any twelve (12) consecutive calendar months.

Seven. The lessor may attach to the leased machinery, or any thereof, an indicator or indicators to register the number of revolutions or movements of any part or parts thereof, and the lessee shall not allow any person (other than the lessor or its agents) to disturb or interfere with such indicator or indicators. In case any indicator thus attached shall from any cause cease to correctly indicate or register, or shall be disturbed or out of repair, or if the glass covering any such indicator shall be removed or broken or injured, then and as often as the same shall happen the lessee shall immediately by writing notify the lessor and at the same time explain the circumstances under which the same has happened. In case any such indicator ceases to indicate, or becomes or remains inaccurate, or the glass covering becomes or remains removed, broken, or injured, because of any fault of the lessee or any one in his employ, or because of the failure of the lessee to give promptly the notice hereinbefore provided for, then, without prejudice to any other rights of the lessor, the lessee shall pay the lessor (without the right to any discount) the sum of two cents per pair for each pair of boots, shoes or other footwear or portions thereof in the manufacture of which the leased machinery or any part thereof shall have been used. The lessee shall keep full and accurate accounts, independently of any indicators that may be placed upon the leased machinery, showing the number of boots, shoes and other footwear, or portions thereof, made by or for him which are pulled over either wholly or in part by the aid of machinery and the number of boots, shoes, or other footwear which are operated upon in any way by any machinery of the lessor of a kind or kinds mentioned by name in the foregoing Schedule of Machines, and shall allow the lessor at all times, by its agents or attorneys, to examine and to take copies of such accounts and entries of the lessee as may serve to determine the total number of such boots, shoes or other footwear, or portions thereof, and the lessee shall produce all such accounts and entries upon request. The lessee shall require each of his operators upon any machines

of a kind or kinds mentioned by name in said Schedule, to keep upon blanks or blank books to be furnished by the lessor accurate daily records of the number of boots, shoes and other footwear, or portions thereof, in the manufacture of which he has used the leased machinery, or any part thereof, and shall require his operators to sign such records, and, if requested so to do by the lessor, shall verify the same under oath. The lessee shall send to the office of the lessor in Boston, on or before the fifth day of each calendar month, the original records for the next preceding calendar month kept by his operators as above provided for, and in case, in any calendar month, any one or more of such machines has been entirely idle, the lessee, on or before the fifth day of the next succeeding calendar month, shall send to the office of the lessor in Boston the blank for such machine or machines for said month marked "not in use" and signed by the lessee. The lessee shall also furnish any further information which may be called for in relation to the leased machinery or the use thereof.

And that the following stipulations and provisions are agreed to: —

Eight. If at any time the lessee shall fail or cease to use exclusively machinery held by him under lease from the lessor for performing all work in the manufacture or preparation of all boots, shoes, or other footwear made by or for him which is performed by the aid of machinery and which is of a kind or kinds which any or all of the machines of the lessor mentioned by name in the foregoing Schedule of Machines are designed to perform, the lessor, although it may have waived or ignored prior instances of such failure or cessation, may at its option terminate forthwith by notice in writing any or all leases or licenses of machinery of the Pulling Over System of the lessor then existing between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise; and the possession of and full right to and control of all machinery the lease or license of which is so terminated shall thereupon revest in the lessor free from all claims and demands whatsoever.

Nine. The term of this agreement shall be seventeen years from

the date hereof. The lease of the leased machinery and license to use the same hereby granted shall continue, unless sooner terminated by the lessor as in this agreement provided, for the full term of this agreement; but, if any breach or default shall be made in the observance of any one or more of the conditions in this agreement contained or contained in any other lease or license agreement between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise and expressed to be obligatory upon the lessee, the lessor shall have the right by notice in writing to the lessee to terminate forthwith any or all leases of or licenses to use machinery then in force between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, and this notwithstanding that previous breaches or defaults may have been unnoticed, waived, or condoned by or on behalf of the lessor. If, upon the expiration of the full term of this agreement, the lessor does not request the return of the leased machinery, then the leased machinery shall continue to be held and used under and in accordance with the conditions, stipulations and provisions in this agreement contained and this agreement and the lease and license herein contained shall thereupon be extended indefinitely as to term; but thereafter either the lessee or the lessor, upon sixty days' notice in writing to the other, may terminate this agreement and the lease and license herein contained, whereupon the leased machinery shall be delivered forthwith to the lessor, as hereinafter provided. Upon the expiration or termination of this agreement or any extension thereof or of the lease and license herein contained, the lessee shall forthwith deliver the leased machinery to the lessor at Beverly, Massachusetts, in good order, reasonable wear and tear alone excepted, and shall thereupon pay to the lessor without prejudice to any other rights or remedies of the lessor such sum as may be necessary to put the leased machinery in suitable order and condition to lease to another lessee, including the cost of all parts replaced at the regular prices established by the lessor therefor. The lessee for himself, his heirs, executors, and administrators, successors and assigns hereby grants to the lessor, its successors and assigns, full right,

power and authority upon such expiration or termination and without prejudice to any other rights or remedies of the lessor to enter upon the premises and into any factory, room, or any place where the leased machinery, or any part thereof, may be, and take possession thereof, and take away the same.

Ten. Upon the expiration or termination of this agreement or any extension thereof or of the lease and license hereby granted the lessee, in addition to all other payments in this agreement provided for and without prejudice to any other rights or remedies of the lessor, shall pay to the lessor as partial reimbursement to the lessor for deterioration of the leased machinery, expenses in connection with the installation thereof and instruction of operators, in respect to each machine hereby leased the sum set opposite the name of such machine in the column numbered IV. in the Schedule of Machines hereinbefore contained.

Eleven. In case at any time the lessee shall have in his possession more machines of any kind or kinds of the Pulling Over System of the lessor than in the opinion of the lessor are necessary for the lessee's work and the lessor shall give the lessee notice in writing thereof designating the machine or machines which in its opinion are unnecessary for the lessee's work, the lessee shall at his own option either return to the lessor at Beverly, Massachusetts, within the period of thirty (30) days from the delivery of said notice the machine or machines therein designated, whereupon the lease of and license to use the machine or machines so returned shall be terminated, or pay to the lessor on the fifteenth day of each succeeding calendar month after the expiration of said period of thirty days in respect to each machine designated in said notice and retained by the lessee and in addition to all other payments and guaranties in this agreement provided for the sum set opposite the name of such machine in Column V. in the foregoing Schedule of Machines; provided, however, that in case the lease of or license to use any machine or machines shall be terminated by the return thereof under the provisions of this Article hereof and without any breach or default in respect to any of the conditions, stipulations or provisions of this agreement or of any other lease or license or

agreement between the lessee and the lessor, the lessee shall pay to the lessor such sum as may be necessary to put the machine or machines so returned in suitable order and condition to lease to another lessee, but shall not be required, in respect to any machine so returned, to make the payment provided for in Article Ten hereof or in the article of any other Pulling Over System lease and license agreement between the lessee and the lessor corresponding to Article Ten hereof. The provisions of this Article hereof are independent of and in addition to all other rights or remedies of the lessor whatsoever, and termination of the lease of or license to use any one or more machines under the provisions of this Article hereof shall not affect the lease of or license to use any other machine or the obligations of the lessee in respect thereto.

Twelve. In case at any time any of the leased machinery shall not, in the opinion of the lessor, be in good and efficient working order and condition, the lessor without prejudice to any other of its rights or remedies may give written notice to the lessee to put such machinery in good and efficient working order and condition and to replace all broken or missing parts; and in case the lessee does not within fifteen (15) days from the date of such notice comply with the requirements thereof, as herein set forth, the lessor may cause such machinery to be put in such good and efficient working order and condition, and may supply such broken or missing parts, and the lessee shall forthwith pay to the lessor the expense of making such repairs and the cost at the regular prices established by the lessor therefor of all parts so supplied.

Thirteen. A notice in writing, signed by the president, a vice-president, the treasurer or the assistant treasurer of the lessor or by any assignee of the lessor's rights hereunder, and posted by prepaid letter, addressed to the lessee or delivered at his usual or last known place of abode or business, that the lease and license hereby granted is terminated or shall be terminated at the expiration of a certain period, shall be a sufficient termination of the lease and license from the time of posting or delivering such notice, or from the expiration of the period therein mentioned, as the case may be. Any termination of such lease and license shall be with-

out prejudice to any rights or remedies which the lessor may have for violation of contract, use of machines without right, use of patented inventions without license or otherwise.

Fourteen. The lessee admits the validity for the full term expressed in the grant thereof (and every extension and renewal thereof) of each and every of the Letters Patent of the United States of America, owned by the lessor or under which it is licensed, any of the inventions of which are or hereafter may be embodied in the leased machinery. The lessee also agrees that he will not directly or indirectly infringe or contest the validity for the full term expressed in the grant thereof or of any extension or renewal thereof of any of the Letters Patent referred to in the "Schedule of Patents" hereto annexed or any of the inventions of which are now or shall hereafter be embodied in the leased machinery or the title of the lessor thereto. The termination or cesser of the agreement or of the lease and license hereby granted or any extension thereof shall not in any way affect the provisions of this Article, or release or discharge the lessee from the admissions and estoppels herein set forth.

Fifteen. None of the conditions, stipulations or provisions of this agreement shall be held to have been waived by any act or knowledge of the lessor, its agents or employees, but only by an instrument in writing, signed by the president, a vice-president, or the treasurer of the lessor.

Sixteen. The term "lessor" shall include the said United Shoe Machinery Company and its successors and assigns. All the conditions, stipulations and provisions binding on the lessee shall be binding on and enforceable against his legal representatives. In the construction of this instrument, words relating to the number and gender of the parties shall be read according to their real number and gender.

In witness whereof, the parties hereto have duly executed this instrument in duplicate, the day and year first above written.

Pulling Over System. (1502.)

Lease and License Number .

Pulling Over System.

This Lease and Agreement made at Boston, in the State of Massachusetts, this day of 19 , between the United Shoe Machinery Company, a corporation organized under the laws of the State of New Jersey, having an office in said Boston, hereinafter referred to as the lessor, of the one part, and of in the State of , hereinafter referred to as the lessee, of the other part:

Witnesseth, that the lessor, in consideration of the covenants and agreements on the part of the lessee herein contained, does hereby lease to and license the lessee under any letters patents belonging to the lessor or under which the lessor has the right to grant such license affecting any inventions which are now or hereafter shall be embodied therein or employed in the operation thereof, to use, subject to the conditions, stipulations and provis-

ions hereinafter contained, the machine or machines designated by number or numbers in the following schedule, viz. : —

SCHEDULE OF MACHINES.

Class A.

Rex Pulling Over Machine, No.

Class B.

Rex Pounding Machine, No.
Rex Assembling Machine, No.
Rex Toe Gumming Machine, No.
Rex Toe Trimming Machine, No.
Rex Upper Trimming Machine, No.
Rex Upper Trimmer Grinding Machine, No.
Rex Rotary Pounding and Trimming Machine, No.
Rex Rotary Knife Grinding Machine, No.

and any duplicate parts, extras, mechanisms and devices relating thereto, or used in connection therewith, now attached to or delivered with the said designated machine or machines or which may at any time hereafter be obtained from the lessor, or be added thereto by or with the consent of the lessor.

The term the "principal machinery hereby leased" wherever used herein shall be construed to include the whole of the machine or machines hereby leased included in Class A in the foregoing schedule, together with all duplicate parts, extras, mechanisms and devices relating thereto held by the lessee under these presents, whether now or hereafter delivered to or in the possession of the lessee.

The term the "auxiliary machinery hereby leased" wherever used herein shall be construed to include the whole of the machine or machines hereby leased included in Class B in the foregoing schedule, together with all duplicate parts, extras, mechanisms and devices relating thereto held by the lessee under these presents, whether now or hereafter delivered to or in the possession of the lessee.

The term the "leased machinery" wherever used herein shall be construed to include both the "principal machinery hereby leased" and the "auxiliary machinery hereby leased."

And that the following are agreed to as conditions of the lease and license of the leased machinery, all of which the lessee covenants and agrees to keep and perform : —

One. The leased machinery shall at all times remain and be the sole and exclusive property of the lessor, and the lessee shall have no right of property therein, but only the right to use the same, upon the conditions herein contained. The leased machinery shall be used only by the lessee himself, or by operatives in his direct employ, and only in the factory now occupied by him at in the State of unless the lessor shall by an instrument in writing signed by its president, vice-president or treasurer authorize the lessee to remove the leased machinery and to use the same elsewhere. The leased machinery shall not be transferred or delivered or sublet to any other person or corporation, and neither the lease nor the license hereby granted can be assigned by the lessee by his own act or by operation of law. If the lessee becomes insolvent or bankrupt, or has a receiving order made against him, or makes or executes any bill of sale, deed of trust or assignment for the benefit of his creditors, or if a sale, mortgage, lease or unauthorized removal of the leased machinery, or any part thereof, be made or attempted, or if any distress or execution or attachment be levied thereon, then and in each such case any or all leases of and licenses to use machinery then existing between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, shall at the option of the lessor cease and determine, and the possession of and full right to and control of all machinery the lease or license of which is so terminated shall thereupon revest in the lessor free from all claims and demands whatsoever. The lessor and its agents and employees shall at all times be given access to the leased machinery for the purpose of inspecting it or watching its use and operation, or of altering, repairing, improving, or adding to it, or determining the nature or extent of its use, and the lessee shall afford all reasonable facilities therefor.

Two. The lessee shall at all times and at his own expense keep the leased machinery in good and efficient working order and condition, and shall not permit any one to injure or deface or remove

any plate, or dates, numbers, or other inscriptions now or hereafter impressed on or affixed to the leased machinery by the lessor. The lessee shall obtain from the lessor exclusively, and shall pay therefor at the regular prices from time to time established by the lessor, all the duplicate parts, extras, mechanisms and devices of every kind needed or used in operating, repairing, or renewing the leased machinery, and the same shall form part of the leased machinery, and the lessee shall not otherwise make or allow to be made any addition, subtraction or alteration to, from, or in the leased machinery, nor interfere with the proper operation of the same.

Three. The lessee shall pay all taxes and assessments which shall be assessed in respect to the leased machinery or other machinery of the lessor held by the lessee under lease or license, upon whomsoever assessed. All taxes or assessments in respect to leases, licenses or agreements covering machinery, or the rights to payments thereunder, shall be construed, for the purposes of this Article, to be assessed in respect to the machinery itself. In case at any time any unapportioned tax or assessment shall be assessed to the lessor in respect in part, but not wholly, to machinery of the lessor in the possession of the lessee, the lessee shall pay to the lessor such proportionate part of the total amount of said unapportioned tax or assessment as the fair valuation, to be determined by the lessor, of said machinery of the lessor in the possession of the lessee bears to the fair valuation, to be determined by the lessor, of all machinery (excepting machinery, if any, in the lessor's own possession) in respect to which the unapportioned tax or assessment has been assessed; provided, however, that if such unapportioned tax or assessment includes any tax or assessment in respect to tangible property in the lessor's own possession the amount thereof, based, at the established rate, upon the fair valuation, to be determined by the lessor, of such property, shall first be deducted and the lessee shall pay his proportionate part as aforesaid of the balance only of said unapportioned tax or assessment after such deduction has been made.

Four. The lessee shall use the principal machinery hereby leased

to its full capacity limited only by the number of boots, shoes, and other footwear or portions thereof made by or for him in the manufacture or preparation of which it is capable of being used.

Five. The auxiliary machinery hereby leased shall be used only in the manufacture of boots, shoes or other footwear which have been or shall be pulled over by Pulling Over Machines held by the lessee under lease from the lessor.

Six. The lessee shall pay to the lessor immediately after the execution hereof as a lease premium the sum of Dollars and the lessee shall also pay to the lessor on the last day of each calendar month as rent or royalty for the leased machinery the sum of one (1) cent in respect to each pair of boots, shoes or other footwear or portions thereof in the manufacture or preparation of which the principal machinery hereby leased has been used during the next preceding calendar month: **provided, however, that in all cases when the lessee shall pay to the lessor on or before the fifteenth day of the calendar month the amount due in accordance with this Article hereof for the next preceding calendar month, the lessor will in consideration of such prompt payment grant a discount of fifty per cent. from the amount so due for such preceding calendar month.** All payments in this agreement provided for are independent of and in addition to all payments provided for in any other leases or licenses or agreements between the lessor and the lessee, excepting, however, that in case at the date of these presents the lessee has under other Pulling Over System lease and license agreements from the lessor one or more "Rex Pulling Over" Machines in addition to the "Rex Pulling Over" Machine or Machines hereby leased, then payment under and in accordance with this Article hereof in respect to any pair of boots, shoes, or other footwear shall relieve the lessee from his obligation to make like payment in respect to that pair of boots, shoes or other footwear under the Article of such other Pulling Over System lease and license agreement or agreements corresponding to this Article hereof. The lessee, however, guarantees that the payments made by him in accordance with the terms of this article hereof shall amount, in each calendar year (after deducting all abatements), to at least

Twenty Dollars ($20) for each calendar month for each "Rex Pulling Over Machine" hereby leased and at the end of each calendar year the lessee shall pay to the lessor the amount, if any, by which the total of such payments for said year have been less than such guaranteed amount: provided, however, that if in any calendar year the factory of the lessee remains wholly idle for any entire calendar month, then the amount guaranteed for that year hereunder shall be reduced by one-twelfth for each such month that the factory thus remains wholly idle, but such reduction shall not be made in respect to more than ten (10) months out of any twelve (12) consecutive calendar months.

Seven. The lessor may attach to the leased machinery, or any thereof, an indicator or indicators to register the number of revolutions or movements of any part or parts thereof, and the lessee shall not allow any person (other than the lessor or its agents) to disturb or interfere with such indicator or indicators. In case any indicator thus attached shall from any cause cease to correctly indicate or register, or shall be disturbed or out of repair, or if the glass covering any such indicator shall be removed or broken or injured, then and as often as the same shall happen the lessee shall immediately by writing notify the lessor and at the same time explain the circumstances under which the same has happened. In case any such indicator ceases to indicate, or becomes or remains inaccurate, or the glass covering becomes or remains removed, broken or injured, because of any fault of the lessee or any one in his employ, or because of the failure of the lessee to give promptly the notice hereinbefore provided for, then, without prejudice to any other rights of the lessor, the lessee shall pay the lessor (without the right to any discount) the sum of two cents per pair for each pair of boots, shoes or other footwear or portions thereof in the manufacture of which the leased machinery or any part thereof shall have been used. The lessee shall keep full and accurate accounts, independently of any indicators that may be placed upon the leased machinery, showing the number of boots, shoes and other footwear, or portions thereof, in the manufacture or preparation of which the leased machinery or any part thereof is used,

and shall allow the lessor at all times, by its agents or attorneys, to examine and to take copies of such accounts and entries of the lessee as may serve to determine the total number of such boots, shoes or other footwear, or portions thereof, and the lessee shall produce all such accounts and entries upon request. The lessee shall require each of his operators upon the principal machinery hereby leased (and also if so requested by the lessor upon the auxiliary machinery hereby leased), or any part thereof, to keep upon blanks or blank-books to be furnished by the lessor accurate daily records of the number of boots, shoes and other footwear, or portions thereof, in the manufacture of which he has used said machinery, or any part thereof, and shall require his operators to sign such records, and, if requested so to do by the lessor, shall verify the same under oath. The lessee shall send to the office of the lessor in Boston, on or before the fifth day of each calendar month, the original records for the next preceding calendar month kept by his operators as above provided for, and in case, in any calendar month, any one or more of the machines hereby leased has been entirely idle, the lessee, on or before the fifth day of the next succeeding calendar month, shall send to the office of the lessor in Boston the blank of such machine or machines for said month marked "not in use" and signed by the lessee. The lessee shall also furnish any further information which may be called for in relation to the leased machinery or the use thereof.

And that the following stipulations and provisions are agreed to:—

Eight. If at any time the lessee shall fail or cease to use exclusively pulling over machinery held by him under lease from the lessor for pulling over all boots, shoes or other footwear made by or for him, which are pulled over by the aid of machinery, the lessor, although it may have waived or ignored prior instances of such failure or cessation, may at its option terminate forthwith by notice in writing any or all leases or licenses of Pulling Over System machinery, then existing between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise; and the possession of and full right to and control of all machinery

the lease or license of which is so terminated shall thereupon revest in the lessor free from all claims and demands whatsoever.

Nine. This lease and license shall continue, unless sooner terminated by the lessor as herein provided, for seventeen years from the date hereof. But if any breach or default shall be made in the observance of any one or more of the conditions herein contained or contained in any other lease or license agreement subsisting between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise and expressed to be obligatory upon the lessee, the lessor shall have the right by notice in writing to the lessee to terminate forthwith any or all leases of or licenses to use machinery then in force between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, and this notwithstanding that previous breaches or defaults may have been unnoticed, waived, or condoned by or on behalf of the lessor. If, upon the expiration of the full term of this lease and license, the lessor does not request the return of the leased machinery, then the leased machinery shall continue to be held and used under and in accordance with the conditions, stipulations and provisions of this lease and license, which shall thereupon be extended indefinitely as to term; but thereafter either the lessee or the lessor, upon sixty days' notice in writing to the other, may terminate this lease and license, whereupon the leased machinery shall be delivered forthwith to the lessor, as herein provided. Upon the expiration or termination of this lease and license or any extension thereof the lessee shall forthwith deliver the leased machinery to the lessor at Beverly, Massachusetts, in good order, reasonable wear and tear alone excepted, and shall thereupon pay to the lessor without prejudice to any other rights or remedies of the lessor such sum as may be necessary to put the leased machinery in suitable order and condition to lease to another lessee, inclu" g the cost of all parts replaced at the regular prices established by the lessor therefor. The lessee for himself, his heirs, executors, and administrators, successors and assigns hereby grants to the lessor, its successors and assigns, full right, power and authority without prejudice to any other rights or remedies of the

lessor to enter upon the premises and into any factory, room, or any place where the leased machinery, or any part thereof, may be, and take possession thereof, and take away the same.

Ten. In case at any time any of the leased machinery shall not, in the opinion of the lessor, be in good and efficient working order and condition, the lessor without prejudice to any other of its rights or remedies may give written notice to the lessee to put such machinery in good and efficient working order and condition and to replace all broken or missing parts; and in case the lessee does not within (15) fifteen days from the date of such notice comply with the requirements thereof, as herein set forth, the lessor may cause such machinery to be put in such good and efficient working order and condition, and may supply such broken or missing parts, and the lessee shall forthwith pay to the lessor the expense of making such repairs and the cost at the regular prices established by the lessor therefor of all parts so supplied.

Eleven. A notice in writing, signed by the president, a vice-president, the treasurer or the assistant treasurer of the lessor or by any assignee of the lessor's rights hereunder, and posted by prepaid letter, addressed to the lessee or delivered at his usual or last known place of abode or business, that the lease and license hereby granted is terminated or shall be terminated at the expiration of a certain period, shall be a sufficient termination of the lease and license from the time of posting or delivering such notice, or from the expiration of the period therein mentioned, as the case may be. Any termination of this lease and license shall be without prejudice to any rights or remedies which the lessor may have for violation of contract, use of machines without right, use of patented inventions without license or otherwise.

Twelve. The lessee admits the validity for the full term expressed in the grant thereof (and every extension and renewal thereof) of each and every of the Letters Patent of the United States of America, owned by the lessor or under which it is licensed, any of the inventions of which are or hereafter may be embodied in the leased machinery. The lessee also agrees that he will not directly or indirectly infringe or contest the validity for the full term expressed

in the grant thereof or of any extension or renewal thereof of any of the Letters Patent referred to in the "Schedule of Patents" hereto annexed or any of the inventions of which are now or shall hereafter be embodied in the leased machinery or the title of the lessor thereto. The termination or cesser of this lease and license or any extension thereof shall not in any way affect the provisions of this Article, or release or discharge the lessee from the admissions and estoppels herein set forth.

Thirteen. None of the conditions, stipulations or provisions of this lease and license shall be held to have been waived by any act or knowledge of the lessor, its agents, or employees, but only by an instrument in writing, signed by the president, a vice-president, or the treasurer of the lessor.

Fourteen. The term "lessor" shall include the said United Shoe Machinery Company and its successors and assigns. All the conditions, stipulations and provisions binding on the lessee shall be binding on and enforceable against his legal representatives. In the construction of this instrument, words relating to the number and gender of the parties shall be read according to their real number and gender.

In witness whereof, the parties hereto have duly executed this instrument in duplicate, the day and year first above written.

General Department. [Form A. H. T., 1181.]

Lease and License Agreement Number .

This Agreement made at Boston in the State of Massachusetts this day of 19 , between the United Shoe Machinery Company, a corporation organized under the laws of the State of New Jersey, having an office in said Boston, hereinafter referred to as the lessor, of the one part, and of in the State of , hereinafter referred to as the lessee, of the other part:

Witnesseth, that the lessor, in consideration of the covenants and agreements on the part of the lessee herein contained, does hereby lease to and license the lessee under any letters patent belonging to the lessor or under which the lessor has the right to grant such license affecting any inventions which are now or hereafter shall be embodied therein or employed in the operation thereof, to use the machine or machines of the General Department of the lessor now or hereafter delivered to the lessee and designated by number or numbers in the following schedule, viz.:—

and any duplicate parts, extras, mechanisms and devices, relating thereto, or used in connection therewith, now attached to or delivered with the said designated machine or machines, or which may at any time hereinafter be obtained from the lessor, or be added thereto by or with the consent of the lessor (the whole of which machine or machines, duplicate parts, extras, mechanisms and devices, held by the lessee under these presents, whether now or hereafter delivered to or in the possession of the lessee, is hereinafter referred to as the "leased machinery"), subject to the conditions hereinafter contained.

And that the following are agreed to as conditions of this agreement, all of which the lessee covenants and agrees to keep and perform:—

One. The leased machinery shall at all times remain and be the sole and exclusive property of the lessor, and the lessee shall have no right of property therein, but only the right to use the same, upon the conditions herein contained. The leased machinery shall be used only by the lessee himself, or by operatives in his direct employ, and only in the factory now occupied by him at in the State of . The leased machinery shall not be transferred or delivered or sublet to any other person or corporation, and neither this agreement nor the lease nor the license hereby granted can be assigned by the lessee by his own act or by operation of law. If the lessee becomes insolvent or bankrupt, or has a receiving order made against him, or makes or executes any bill of sale, deed of trust or assignment for the benefit of his creditors, or if a sale, mortgage, lease or removal of the leased machinery, or any part thereof, be made or attempted, or if any distress or execution or attachment be levied thereon, then and in each such case any or all leases of or licenses to use machinery then existing between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, shall at the option of the lessor cease and determine, and the possession of and full right to and

control of all machinery the leases or licenses of which are so terminated, shall thereupon revest in the lessor free from all claims or demands whatsoever. The lessor and its agents and employees shall at all times be given access to the leased machinery for the purpose of inspecting it or watching its use and operation, or of altering, repairing, improving, or adding to it, or determining the nature or extent of its use, and the lessee shall afford all reasonable facilities therefor.

Two. The lessee shall at all times and at his own expense keep the leased machinery in good and efficient working order and condition, and shall not permit any one to injure or deface or remove any plate, or dates, numbers, or other inscriptions now or hereafter impressed on or affixed to the leased machinery by the lessor. The lessee shall obtain from the lessor exclusively and shall pay therefor at the regular prices from time to time established by the lessor, all the duplicate parts, extras, mechanisms and devices, of every kind needed or used in operating, repairing, or renewing the leased machinery, and the same shall form part of the leased machinery, and the lessee shall not otherwise make or allow to be made any addition, subtraction or alteration to, from, or in the leased machinery without the consent in writing of the lessor, nor interfere with the proper operation of the same.

Three. The lessee shall pay all taxes and assessments which shall be assessed in respect to the leased machinery or other machinery of the lessor held by the lessee under lease or license upon whomsoever assessed. All taxes or assessments in respect to leases, licenses or agreements covering machinery, or the rights to payments thereunder, shall be construed, for the purposes of this article, to be assessed in respect to the machinery itself. In case at any time any unapportioned tax or assessment shall be assessed to the lessor in respect in part but not wholly to machinery of the lessor in the possession of the lessee the lessee shall pay to the lessor such proportionate part of the total amount of said unapportioned tax or assessment as the fair valuation, to be determined by the lessor, of said machinery of the lessor in the possession of the lessee bears to the fair valuation, to be determined by the lessor, of

all machinery (excepting machinery, if any, in the lessor's own possession) in respect to which the unapportioned tax or assessment has been assessed; provided, however, that if such unapportioned tax or assessment includes any tax or assessment in respect to tangible property in the lessor's own possession the amount thereof, based at the established rate, upon the fair valuation, to be determined by the lessor of such property, shall first be deducted and the lessee shall pay his proportionate part as aforesaid of the balance only of said unapportioned tax or assessment after such deduction has been made.

Four. The leased machinery shall not nor shall any part thereof be used in the manufacture of any welted boots, shoes or other footwear which have been or shall be welted or the soles stitched by the aid of any welt sewing or sole stitching machinery not held by the lessee under lease from the lessor or in the manufacture of any turn boots, shoes or other footwear the soles of which have been or shall be attached to their uppers by the aid of any turn sewing machinery not held by the lessee under lease from the lessor, or in the manufacture of any boots, shoes or other footwear which have been or shall be lasted, pegged, slugged, heel seat nailed, or otherwise partly made by the aid of any lasting or pegging or "Metallic" machinery or mechanisms not held by the lessee under lease from the lessor.

Five. The lessee shall pay to the lessor immediately after the execution hereof, as a lease premium, the sum of dollars.

Six. The lessor may attach to the leased machinery, or any thereof, an indicator or indicators to register the number of revolutions or movements of any part or parts thereof, and the lessee shall not allow any person (other than the lessor or its agents) to disturb or interfere with such indicator or indicators. In case any indicator thus attached shall from any cause cease to correctly indicate or register, or shall be disturbed or out of repair, or if the glass covering any such indicator shall be removed or broken or injured, then and as often as the same shall happen the lessee shall immediately by writing notify the lessor and at the same time explain the circumstances under which the same has happened.

And that the following stipulations and provisions are agreed to: —

Seven. The term of this agreement shall be seventeen years from the date hereof. The lease of the leased machinery and license to use the same hereby granted shall continue, unless sooner terminated by the lessor because of breach thereof on the part of the lessee, or otherwise as herein provided, for the full term of this agreement, but if any breach or default shall be made in the observance of any one or more of the conditions in this agreement contained or contained in any other lease or license agreement subsisting between the lessor and the lessee whether as the result of assignment to the lessor or otherwise and expressed to be obligatory upon the lessee, the lessor shall have the right by notice in writing to the lessee to terminate forthwith the lease and license hereby granted, and this notwithstanding that previous breaches or defaults may have been unnoticed, waived or condoned by or on behalf of the lessor. If, upon the expiration of the full term of this agreement, the lessor does not request the return of the leased machinery, then the leased machinery shall continue to be held and used under and in accordance with the conditions, stipulations and provisions in this agreement contained and this agreement and the lease and license herein contained shall thereupon be extended indefinitely as to to term; but thereafter either the lessee or the lessor, upon sixty days' notice in writing to the other, may terminate this agreement and the lease and license herein contained, whereupon the leased machinery shall be delivered forthwith to the lessor, as herein provided. Upon the expiration or termination of the lease hereby granted or any extension thereof by notice or by reason of any default on the part of the lessee as to the terms of this agreement or of any other lease or license agreement from the lessor or otherwise, in any manner whatsoever, the lessee shall forthwith at his own expense deliver the leased machinery to the lessor at Beverly, Massachusetts, complete and in good order, reasonable wear and tear alone excepted; and the lessee for himself, his heirs, executors and administrators, hereby grants to the lessor, its successors and assigns, full right, power and authority

to enter upon the premises and into any factory, room, or any place where the leased machinery, or any part thereof, may be, and take possession thereof, and take away the same; and the lessee shall have no claim for the repayment of any sum or sums, or any part thereof, which he shall have paid as consideration for the grant of the lease and license herein contained, or for rent or royalty, or otherwise in respect to the leased machinery.

Eight. A notice in writing, signed by the president, a vice-president, the treasurer or an assistant treasurer of the lessor or by any assignee of the lessor's rights hereunder, and posted by prepaid letter, addressed to the lessee or delivered at his usual or last known place of abode or business, that the lease and license hereby granted is terminated or shall be terminated at the expiration of a certain period, shall be a sufficient termination of the lease and license from the time of posting or delivering such notice, or from the expiration of the period therein mentioned, as the case may be. Any termination of this agreement or of the lease and license hereby granted shall not release the lessee from his obligation to pay rent or royalty for the period prior to such termination and shall be without prejudice to any other rights or remedies which the lessor may have for violation of contract, use of machines without right or use of patented inventions without license.

Nine. The lessee admits the validity for the full term expressed in the grant thereof (and every extension and renewal thereof) of each and every of the Letters Patent of the United States of America, owned by the lessor or under which it is licensed, any of the inventions of which are or hereafter may be embodied in the leased machinery. The lessee also agrees that he will not directly or indirectly infringe or contest the validity for the full term expressed in the grant thereof or of any extension or renewal thereof, of any of said Letters Patent or the title of the lessor thereto. The expiration of this agreement or any extension thereof or the termination or cesser of the lease and license hereby granted shall not in any way affect the provisions of this clause, or release or discharge the lessee from the admissions and estoppels herein set forth.

Ten. None of the conditions, stipulations or provisions of this

agreement shall be held to have been waived by any act or knowledge of the lessor, its agents or employees, but only by an instrument in writing, signed by the president, a vice-president or the treasurer of the lessor.

Eleven. The term "lessor" shall include the said United Shoe Machinery Company and its successors and assigns. All the conditions, stipulations and provisions binding on the lessee shall be binding on and enforceable against his legal representatives. In the construction of this instrument, words relating to the number and gender of the parties shall be read according to their real number and gender.

In witness whereof, the parties hereto have duly executed this instrument in duplicate, the day and year first above written.

Lease and License Agreement Number .

This Agreement made at Boston in the State of Masssachusetts this day of 19 , between the United Shoe Machinery Company, a corporation organized under the laws of the State of New Jersey, having an office in said Boston, hereinafter referred to as the lessor, of the one part, and in the State of hereinafter referred to as the lessee, of the other part:

Witnesseth, that the lessor, in consideration of the covenants and agreements on the part of the lessee herein contained, does

hereby lease to and license the lessee under any letters patent belonging to the lessor or under which the lessor has the right to grant such license affecting any inventions which are now or hereafter shall be embodied therein or employed in the operation thereof, to use the machine or machines of the General Department of the lessor now or hereafter delivered to the lessee and designated by number or numbers in the following schedule, viz. : —

SCHEDULE OF MACHINES.

	I.	II.	III.
	$	$	$

and any duplicate parts, extras, mechanisms and devices relating thereto, or used in connection therewith, now attached to or delivered with the said designated machine or machines, or which may at any time hereafter be obtained from the lessor, or be added thereto by or with the consent of the lessor (the whole of which machine or machines, duplicate parts, extras, mechanisms and devices, held by the lessee under these presents, whether now or hereafter delivered to or in the possession of the lessee, is hereinafter referred to as the "leased machinery"), subject to the conditions hereinafter contained.

And that the following are agreed to as conditions of this agreement, all of which the lessee covenants and agrees to keep and perform : —

One. The leased machinery shall at all times remain and be the sole and exclusive property of the lessor, and the lessee shall have no right of property therein, but only the right to use the same, upon the conditions herein contained. The leased machinery shall be used only by the lessee himself or by operatives in his direct employ, and only in the factory now occupied by him at in the State of . The leased machinery shall not be transferred or delivered or sublet to any other person or corporation, and neither this agreement nor the lease nor the license hereby granted can be assigned by the lessee by his own act or by operation of law. If the lessee becomes insolvent or bankrupt, or has a receiving order made against him, or makes or executes any bill of sale, deed of trust or assignment for the benefit of his creditors, or if a sale,

mortgage, lease or removal of the leased machinery, or any part thereof, be made or attempted, or if any distress or execution or attachment be levied thereon, then and in each such case any or all leases of or licenses to use machinery then existing between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, shall at the option of the lessor cease and determine, and the possession of and full right to and control of all machinery the leases or licenses of which are so terminated shall thereupon revest in the lessor free from all claims or demands whatsoever. The lessor and its agents and employees shall at all times be given access to the leased machinery for the purpose of inspecting it or watching its use and operation, or of altering, repairing, improving, or adding to it, or determining the nature or extent of its use, and the lessee shall afford all reasonable facilities therefor.

Two. The lessee shall at all times and at his own expense keep the leased machinery in good and efficient working order and condition, and shall not permit any one to injure or deface or remove any plate, or dates, numbers, or other inscriptions now or hereafter impressed on or affixed to the leased machinery by the lessor. The lessee shall obtain from the lessor exclusively, and shall pay therefor at the regular prices from time to time established by the lessor, all the duplicate parts, extras, mechanisms and devices, of every kind needed or used in operating, repairing, or renewing the leased machinery, and the same shall form part of the leased machinery, and the lessee shall not otherwise make or allow to be made any addition, subtraction or alteration to, from, or in the leased machinery without the consent in writing of the lessor, nor interfere with the proper operation of the same.

Three. The leased machinery shall at all times, until the expiration or termination of the lease thereof and license to use the same hereby granted and the re-delivery of the leased machinery into the possession of the lessor as hereinafter provided, be held at the sole risk of the lessee from injury, loss or destruction, and, in case any machine or machines hereby leased shall be destroyed by fire or otherwise before such expiration or termination and re-delivery,

the lessee shall pay to the lessor in respect to each machine so destroyed the sum set opposite the name of each such machine in column numbered "I." in the "Schedule of Machines" hereinbefore contained as partial reimbursement to the lessor for such destruction, and the lessee shall forthwith return whatever remains of the machinery so destroyed to the lessor at Beverly, Massachusetts.

Four. The lessee shall pay all taxes and assessments which shall be assessed in respect to the leased machinery or other machinery of the lessor held by the lessee under lease or license upon whomsoever assessed. All taxes or assessments in respect to leases, licenses or agreements covering machinery, or the rights to payments thereunder, shall be construed, for the purposes of this article, to be assessed in respect to the machinery itself. In case at any time any unapportioned tax or assessment shall be assessed to the lessor in respect in part but not wholly to machinery of the lessor in the possession of the lessee the lessee shall pay to the lessor such proportionate part of the total amount of said unapportioned tax or assessment as the fair valuation, to be determined by the lessor, of said machinery of the lessor in the possession of the lessee bears to the fair valuation, to be determined by the lessor, of all machinery (excepting machinery, if any, in the lessor's own possession) in respect to which the unapportioned tax or assessment has been assessed; provided, however, that if such unapportioned tax or assessment includes any tax or assessment in respect to tangible property in the lessor's own possession the amount thereof, based, at the established rate, upon the fair valuation, to be determined by the lessor, of such property, shall first be deducted and the lessee shall pay his proportionate part as aforesaid of the balance only of said unapportioned tax or assessment after such deduction has been made.

Five. The leased machinery shall not nor shall any part thereof be used in the manufacture of any welted boots, shoes or other footwear which have been or shall be welted or the soles stitched by the aid of any welt sewing or sole stitching machinery not held by the lessee under lease from the lessor or in the manufacture of any turn boots, shoes or other footwear the soles of which have

been or shall be attached to their uppers by the aid of any turn sewing machinery not held by the lessee under lease from the lessor, or in the manufacture of any boots, shoes or other footwear which have been or shall be lasted, pegged, slugged, heel seat nailed, or otherwise partly made by the aid of any lasting or pegging or "Metallic" machinery or mechanisms not held by the lessee under lease from the lessor.

Six. The lessee shall pay to the lessor annually during the period of ten years from the date hereof in respect to each machine hereby leased the amount set opposite the name of such machine in column numbered "II." in the "Schedule of Machines" hereinbefore contained, and annually thereafter during the continuance of the lease hereby granted or any extension thereof shall pay to the lessor, in respect to each machine hereby leased, one-half of such amount. Such annual payment shall be made on the first day of July in each year, excepting that the first payment shall be made immediately upon the execution of this agreement and shall be such proportionate part of the amount set forth in said column "II." in respect to each machine as the time from the date hereof up to the first day of July next succeeding bears to an entire year.

Seven. Independently of and in addition to all other payments herein provided for the lessee upon the expiration or termination of the lease hereby granted or any extension thereof shall pay to the lessor in respect to each machine hereby leased the amount set opposite the name of such machine in column numbered "III." in the "Schedule of Machines" hereinbefore contained; provided, however, that in case at all times prior to such expiration or termination the lessee shall have faithfully kept, observed and performed all of the conditions, terms, agreements, stipulations and provisions of this lease and license agreement and of all other leases and licenses and agreements between the lessor and the lessee, and is not in default in respect to any payment or otherwise hereunder or thereunder, and shall promptly and fully carry out all obligations incumbent upon the lessee upon such expiration or termination, the payment in this article hereof provided to be made in respect to each such machine shall be reduced by an amount equal to one-half of

the annual payments theretofore made by the lessee to the lessor in respect to such machine under the provisions of Article Six hereof; or in case one-half of such annual payments theretofore made by the lessee to the lessor in respect to such machine equals or exceeds the payment in this article hereof provided to be made in respect thereto then said payment under this article hereof in respect to said machine shall be waived.

Eight. The lessor may attach to the leased machinery or any thereof an indicator or indicators to register the number of revolutions or movements of any part or parts thereof, and the lessee shall not allow any person (other than the lessor or its agents) to disturb or interfere with such indicator or indicators. In case any indicator thus attached shall from any cause cease to correctly indicate or register, or shall be disturbed or out of repair, or if the glass covering any such indicator shall be removed or broken or injured, then and as often as the same shall happen the lessee shall immediately by writing notify the lessor and at the same time explain the circumstances under which the same has happened.

And that the following stipulations and provisions are agreed to: —

Nine. The term of this agreement shall be seventeen years from the date hereof. The lease of the leased machinery and license to use the same hereby granted shall continue, unless sooner terminated by the lessor because of breach thereof on the part of the lessee, or otherwise as herein provided, for the full term of this agreement. But if any breach or default shall be made in the observance of any one or more of the conditions in this agreement contained or contained in any other lease or license agreement subsisting between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise and expressed to be obligatory upon the lessee, the lessor shall have the right by notice in writing to the lessee to terminate forthwith the lease and license hereby granted, and this notwithstanding that previous breaches or defaults may have been unnoticed, waived, or condoned by or on behalf of the lessor. If, upon the expiration of the full term of this agreement, the lessor does not request the return of the leased

machinery, then the leased machinery shall continue to be held and used under and in accordance with the conditions, stipulations and provisions in this agreement contained and this agreement and the lease and license herein contained shall thereupon be extended indefinitely as to term; but thereafter either the lessee or the lessor, upon sixty days' notice in writing to the other, may terminate this agreement and the lease and license herein contained, whereupon the leased machinery shall be delivered forthwith to the lessor, as herein provided. Upon the expiration or termination of this agreement or any extension thereof or of the lease and license herein contained by notice or by reason of any default on the part of the lessee as to the terms of this agreement or of any other lease or license agreement from the lessor or otherwise, in any manner whatsoever, the lessee shall forthwith at his own expense deliver the leased machinery to the lessor at Beverly, Massachusetts, complete and in good order, reasonable wear and tear alone excepted; and the lessee, for himself, his heirs, executors and administrators, hereby grants to the lessor, its successors and assigns, full right, power and authority to enter upon the premises and into any factory, room, or any place where the leased machinery, or any part thereof, may be, and take possession thereof, and take away the same.

Ten. In case at any time any of the leased machinery shall not, in the opinion of the lessor, be in good and efficient working order and condition, the lessor without prejudice to any other of its rights or remedies may give written notice to the lessee to put such machinery in good and efficient working order and condition and to replace all broken or missing parts; and in case the lessee does not within fifteen (15) days from the date of such notice comply with the requirements thereof, as herein set forth, the lessor may cause such machinery to be put in such good and efficient working order and condition, and may supply such broken or missing parts, and the lessee shall forthwith pay to the lessor the expense of making such repairs and the cost at the regular prices established by the lessor therefor of all parts so supplied.

Eleven. A notice in writing, signed by the president, a vice-presi-

dent, the treasurer or an assistant treasurer of the lessor or by any assignee of the lessor's rights hereunder, and posted by prepaid letter, addressed to the lessee or delivered at his usual or last known place of abode or business, that the lease and license hereby granted is terminated or shall be terminated at the expiration of a certain period, shall be a sufficient termination of the lease and license from the time of posting or delivering such notice, or from the expiration of the period therein mentioned, as the case may be. Any termination of this agreement or of the lease and license hereby granted shall not release the lessee from his obligation to pay rent or royalty for the period prior to such termination, and shall be without prejudice to any other rights or remedies which the lessor may have for violation of contract, use of machines without right or use of patented inventions without license.

Twelve. The lessee admits the validity for the full term expressed in the grant thereof (and every extension and renewal thereof), of each and every of the Letters Patent of the United States of America, owned by the lessor or under which it is licensed, any of the inventions of which are or hereafter may be embodied in the leased machinery. The lessee also agrees that he will not directly or indirectly infringe or contest the validity for the full term expressed in the grant thereof or of any extension or renewal thereof, of any of said Letters Patent or the title of the lessor thereto. The expiration of this agreement or any extension thereof or the termination or cesser of the lease and license hereby granted shall not in any way affect the provisions of this clause, or release or discharge the lessee from the admissions and estoppels herein set forth.

Thirteen. None of the conditions, stipulations or provisions of this agreement shall be held to have been waived by any act or knowledge of the lessor, its agents or employees, but only by an instrument in writing, signed by the president, a vice-president or the treasurer of the lessor.

Fourteen. The term "lessor" shall include the said United Shoe Machinery Company and its successors and assigns. All the conditions, stipulations and provisions binding on the lessee shall be binding on and enforceable against his legal representatives. In

the construction of this instrument, words relating to the number and gender of the parties shall be read according to their real number and gender.

In witness whereof, the parties hereto have duly executed this instrument in duplicate, the day and year first above written.

Lease and License Agreement Number .

This Agreement made at Boston, in the State of Massachusetts, this day of 19 , between the United Shoe Machinery Company, a corporation organized under the laws of the State of New Jersey, having an office in said Boston, hereinafter referred to as the lessor, of the one part, and of in the State of , hereinafter referred to as the lessee, of the other part:

Witnesseth, that the lessor, in consideration of the covenants and agreements on the part of the lessee herein contained, does hereby lease to and license the lessee under any letters patent belonging to the lessor or under which the lessor has the right to grant such license affecting any inventions which are now or hereafter shall be embodied therein or employed in the operation thereof, to use

Power Eyeletting Machine(s) No(s.)

now or hereafter delivered to the lessee, and any duplicate parts,

extras, mechanisms and devices relating thereto, or used in connection therewith, now attached to or delivered with the said designated machine or machines, or which may at any time hereafter be obtained from the lessor, or be added thereto by or with the consent of the lessor (the whole of which machine or machines, duplicate parts, extras, mechanisms and devices, held by the lessee under these presents, whether now or hereafter delivered to or in the possession the lessee, is hereinafter referred to as the "leased machinery"), subject to the conditions hereinafter contained.

And that the following are agreed to as conditions of this agreement, all of which the lessee covenants and agrees to keep and perform: —

One. The leased machinery shall at all times remain and be the sole and exclusive property of the lessor, and the lessee shall have no right of property therein, but only the right to use the same, upon the conditions herein contained. The leased machinery shall be used only by the lessee himself, or by operatives in his direct employ, and only in the factory now occupied by him at in the State of . The leased machinery shall not be transferred or delivered or sublet to any other person or corporation, and neither this agreement nor the lease nor the license hereby granted can be assigned by the lessee by his own act or by operation of law. If the lessee becomes insolvent or bankrupt, or has a receiving order made against him, or makes or executes any bill of sale, deed of trust or assignment for the benefit of his creditors, or if a sale, mortgage, lease or removal of the leased machinery, or any part thereof, be made or attempted, or if any distress or execution or attachment be levied thereon, then and in each such case any or all leases of or licenses to use machinery then existing between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, shall at the option of the lessor cease and determine, and the possession of and full right to and control of all machinery the leases or licenses of which are so terminated, shall thereupon revest in the lessor free from all claims or demands whatsoever. The lessor and its agents and employees shall at all times be given access to the leased machinery for the purpose of inspect-

ing it or watching its use and operation, or of altering, repairing, improving, or adding to it, or determining the nature or extent of its use, and the lessee shall afford all reasonable facilities therefor.

Two. The lessee shall at all times and at his own expense keep the leased machinery in good and efficient working order and condition, and shall not permit any one to injure or deface or remove any plate, or dates, numbers, or other inscriptions now or hereafter impressed on or affixed to the leased machinery by the lessor. The lessee shall obtain from the lessor exclusively, and shall pay therefor at the regular prices from time to time established by the lessor, all the duplicate parts, extras, mechanisms and devices, of every kind needed or used in operating, repairing, or renewing the leased machinery, and the same shall form part of the leased machinery, and the lessee shall not otherwise make or allow to be made any addition, subtraction or alteration to, from, or in the leased machinery without the consent in writing of the lessor, nor interfere with the proper operation of the same.

Three. The lessee shall pay all taxes and assessments which shall be assessed in respect to the leased machinery or other machinery of the lessor held by the lessee under lease or license upon whomsoever assessed. All taxes or assessments in respect to leases, licenses or agreements covering machinery, or the rights to payments thereunder, shall be construed, for the purposes of this article, to be assessed in respect to the machinery itself. In case at any time any unapportioned tax or assessment shall be assessed to the lessor in respect in part but not wholly to machinery of the lessor in the possession of the lessee the lessee shall pay to the lessor such proportionate part of the total amount of said unapportioned tax or assessment as the fair valuation, to be determined by the lessor, of said machinery of the lessor in the possession of the lessee bears to the fair valuation, to be determined by the lessor, of all machinery (excepting machinery, if any, in the lessor's own possession) in respect to which the unapportioned tax or assessment has been assessed; provided, however, that if such unapportioned tax or assessment includes any tax or assessment in respect to tangible property in the lessor's own possession the amount thereof, based,

at the established rate, upon the fair valuation, to be determined by the lessor, of such property, shall first be deducted and the lessee shall pay his proportionate part as aforesaid of the balance only of said unapportioned tax or assessment after such deduction has been made.

Four. The lessee shall use the leased machinery to its full capacity on all boots, shoes, footwear, and other articles made in his factory in the manufacture of which it can be used.

Five. The lessee shall pay to the lessor immediately after the execution hereof, as a lease premium, the sum of one hundred dollars ($100) for each machine hereby leased, and the lessee shall also, as rent or royalty for the leased machinery, purchase exclusively of the lessor or its authorized agents, at the prices from time to time established by the lessor, all eyelets used by him in or in connection with the leased machinery, and shall pay therefor upon the regular terms established by the lessor therefor.

Six. The lessor may attach to the leased machinery or any thereof an indicator or indicators to register the number of revolutions or movements of any part or parts thereof, and the lessee shall not allow any person (other than the lessor or its agents) to disturb or interfere with such indicator or indicators. In case any indicator thus attached shall from any cause cease to correctly indicate or register, or shall be disturbed or out of repair, or if the glass covering any such indicator shall be removed or broken or injured, then and as often as the same shall happen the lessee shall immediately by writing notify the lessor and at the same time explain the circumstances under which the same has happened.

And that the following stipulations and provisions are agreed to: —

Seven. The term of this agreement shall be seventeen years from the date hereof. The lease of the leased machinery and license to use the same hereby granted shall continue, unless sooner terminated by the lessor because of breach thereof on the part of the lessee, or otherwise as herein provided, for the full term of this agreement; but in case at any time the lessee shall discontinue or suspend the operation of said factory, or shall discontinue or sus-

pend the manufacture in said factory in the regular course of business of articles in the manufacture of which the leased machinery can be used, or if at any time or for any reason the lessee shall fail or cease to make regular use of the leased machinery in the ordinary course of business, then the lessor shall have the right at its option, by notice in writing to the lessee, to terminate forthwith the lease and license hereby granted, and in case at any time any breach or default shall be made in the observance of any one or more of the conditions in this agreement contained or contained in any other lease or license agreement subsisting between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise and expressed to be obligatory upon the lessee, the lessor shall have the right by notice in writing to the lessee to terminate forthwith any or all leases of or licenses to use machinery then in force between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, and this notwithstanding that previous breaches or defaults may have been unnoticed, waived, or condoned by or on behalf of the lessor. If, upon the expiration of the full term of this agreement, the lessor does not request the return of the leased machinery, then the leased machinery shall continue to be held and used under and in accordance with the conditions, stipulations and provisions in this agreement contained and this agreement and the lease and license herein contained shall thereupon be extended indefinitely as to term; but thereafter either the lessee or the lessor, upon sixty days' notice in writing to the other, may terminate this agreement and the lease and license herein contained, whereupon the leased machinery shall be delivered forthwith to the lessor, as herein provided. Upon the expiration or termination of the lease hereby granted or any extension thereof by notice or by reason of any default on the part of the lessee as to the terms of this agreement or of any other lease or license agreement from the lessor or otherwise, in any manner whatsoever, the lessee shall forthwith at his own expense deliver the leased machinery to the lessor at Beverly, Massachusetts, complete and in good order, reasonable wear and tear alone excepted; and the lessee for himself, his heirs, executors and administrators, hereby grants to the

lessor, its successors and assigns, full right, power and authority to enter upon the premises and into any factory, room, or any place where the leased machinery, or any part thereof, may be, and take possession thereof, and take away the same; and the lessee in addition and without prejudice to any other rights or remedies of the lessor hereunder shall thereupon pay to the lessor such sum as may be necessary to put the leased machinery in suitable order and condition to lease to another lessee.

Eight. A notice in writing, signed by the president, a vice-president, the treasurer or an assistant treasurer of the lessor or by any assignee of the lessor's rights hereunder and posted by prepaid letter, addressed to the lessee or delivered at his usual or last known place of abode or business, that the lease and license hereby granted is terminated or shall be terminated at the expiration of a certain period, shall be a sufficient termination of the lease and license from the time of posting or delivering such notice, or from the expiration of the period therein mentioned, as the case may be. Any termination of this agreement or of the lease and license hereby granted shall not release the lessee from his obligation to pay rent or royalty for the period prior to such termination and shall be without prejudice to any other rights or remedies which the lessor may have for violation of contract, use of machines without right or use of patented inventions without license.

Nine. The lessee admits the validity for the full term expressed in the grant thereof (and every extension and renewal thereof) of each and every of the Letters Patent of the United States of America, owned by the lessor or under which it is licensed, any of the inventions of which are or hereafter may be embodied in the leased machinery. The lessee also agrees that he will not directly or indirectly infringe or contest the validity for the full term expressed in the grant thereof or of any extension or renewal thereof, of any of the Letters Patent referred to in the Schedule of Patents hereto annexed or the title of the lessor thereto. The expiration of this agreement or any extension thereof or the termination or cesser of the lease and license hereby granted shall not in any way affect the

provisions of this clause, or release or discharge the lessee from the admissions and estoppels herein set forth.

Ten. None of the conditions, stipulations or provisions of this agreement shall be held to have been waived by any act or knowledge of the lessor, its agents or employees, but only by an instrument in writing, signed by the president, a vice-president, or the treasurer of the lessor.

Eleven. The term "lessor" shall include the said United Shoe Machinery Company and its successors and assigns. All the conditions, stipulations and provisions binding on the lessee shall be binding on and enforceable against his legal representatives. In the construction of this instrument, words relating to the number and gender of the parties shall be read according to their real number and gender.

In witness whereof, the parties hereto have duly executed this instrument in duplicate, the day and year first above written.

Lease and License Agreement Number .

This Agreement made at Boston, in the State of Massachusetts, this day of , 19 , between the United Shoe Machinery Company, a corporation organized under the laws of the State of New Jersey, having an office in said Boston, hereinafter referred to as the lessor, of the one part, and of in the State of , hereinafter referred to as the lessee, of the other part:

Witnesseth, that the lessor in consideration of the covenants and agreements on the part of the lessee herein contained, does hereby lease to and license the lessee under any letters patent belonging to the lessor or under which the lessor has the right to grant such license affecting any inventions which are now or hereafter shall be embodied therein or employed in the operation thereof, to use

Power Eyeletting Machine(s) No(s).

now or hereafter delivered to the lessee, and any duplicate parts, extras, mechanisms and devices relating thereto, or used in connection therewith, now attached to or delivered with the said designated machine or machines, or which may at any time hereafter be obtained from the lessor, or be added thereto by or with the consent of the lessor (the whole of which machine or machines, duplicate parts, extras, mechanisms and devices, held by the lessee under these presents, whether now or hereafter delivered to or in the possession of the lessee, is hereinafter referred to as the "leased machinery"), subject to the conditions hereinafter contained.

And that the following are agreed to as conditions of this agree-

ment, all of which the lessee covenants and agrees to keep and perform: —

One. The leased machinery shall at all times remain and be the sole and exclusive property of the lessor, and the lessee shall have no right of property therein, but only the right to use the same, upon the conditions herein contained. The leased machinery shall be used only by the lessee himself or by operatives in his direct employ, and only in the factory now occupied by him at in the State of . The leased machinery shall not be transferred or delivered or sublet to any other person or corporation, and neither this agreement nor the lease nor the license hereby granted can be assigned by the lessee by his own act or by operation of law. If the lessee becomes insolvent or bankrupt, or has a receiving order made against him, or makes or executes any bill of sale, deed of trust or assignment for the benefit of his creditors, or if a sale, mortgage, lease or removal of the leased machinery, or any part thereof, be made or attempted, or if any distress or execution or attachment be levied thereon, then and in each such case any or all leases of or licenses to use machinery then existing between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, shall at the option of the lessor cease and determine, and the possession of and full right to and control of all machinery the leases or licenses of which are so terminated, shall thereupon revest in the lessor free from all claims or demands whatsoever. The lessor and its agents and employees shall at all times be given access to the leased machinery for the purpose of inspecting it or watching its use and operation, or of altering, repairing, improving, or adding to it, or determining the nature or extent of its use, and the lessee shall afford all reasonable facilities therefor.

Two. The lessee shall at all times and at his own expense keep the leased machinery in good and efficient working order and condition, and shall not permit any one to injure or deface or remove any plate, or dates, numbers, or other inscriptions now or hereafter impressed on or affixed to the leased machinery by the lessor. The lessee shall obtain from the lessor exclusively, and shall pay

therefor at the regular prices from time to time established by the lessor, all the duplicate parts, extras, mechanisms and devices of every kind needed or used in operating, repairing or renewing the leased machinery, and the same shall form part of the leased machinery, and the lessee shall not otherwise make or allow to be made any addition, subtraction or alteration to, from, or in the leased machinery without the consent in writing of the lessor, nor interfere with the proper operation of the same.

Three. The leased machinery shall at all times, until the expiration or termination of the lease thereof and license to use the same hereby granted and the re-delivery of the leased machinery into the possession of the lessor as hereinafter provided, be held at the sole risk of the lessee from injury, loss or destruction, and in case the same or any thereof be destroyed by fire or otherwise before such expiration or termination and re-delivery, the lessee shall pay to the lessor in respect to each machine so destroyed the sum of One Hundred and Fifty Dollars ($150) as partial reimbursement to the lessor for such destruction, and the lessee shall forthwith return whatever remains of the machinery so destroyed to the lessor at Beverly, Massachusetts.

Four. The lessee shall pay all taxes and assessments which shall be assessed in respect to the leased machinery or other machinery of the lessor held by the lessee under lease or license upon whomsoever assessed. All taxes or assessments in respect to leases, licenses or agreements covering machinery, or the rights to payments thereunder, shall be construed, for the purposes of this article, to be assessed in respect to the machinery itself. In case at any time any unapportioned tax or assessment shall be assessed to the lessor in respect in part but not wholly to machinery of the lessor in the possession of the lessee the lessee shall pay to the lessor such proportionate part of the total amount of said unapportioned tax or assessment as the fair valuation, to be determined by the lessor, of said machinery of the lessor in the possession of the lessee bears to the fair valuation, to be determined by the lessor, of all machinery (excepting machinery, if any, in the lessor's own possession) in respect to which the unapportioned tax or assess-

ment has been assessed; provided, however, that if such unapportioned tax or assessment includes any tax or assessment in respect to tangible property in the lessor's own possession the amount thereof, based, at the established rate, upon the fair valuation, to be determined by the lessor, of such property, shall first be deducted and the lessee shall pay his proportionate part as aforesaid of the balance only of said unapportioned tax or assessment after such deduction has been made.

Five. The lessee shall use the leased machinery to its full capacity on all boots, shoes, footwear, and other articles made in his factory in the manufacture of which it can be used, but the leased machinery shall not nor shall any part thereof be used in the manufacture of any welted boots, shoes, or other footwear which have been or shall be welted or the soles stitched by the aid of any welt sewing or sole stitching machinery not held by the lessee under lease from the lessor, or in the manufacture of any turn boots, shoes, or other footwear the soles of which have been or shall be attached to their uppers by the aid of any turn sewing machinery not held by the lessee under lease from the lessor or in the manufacture of any boots, shoes or other footwear which have been or shall be lasted, pegged, slugged, heel seat nailed, or otherwise partly made by the aid of any lasting or pegging or "Metallic" machinery or mechanisms not held by the lessee under lease from the lessor or in the manufacture of any boots, shoes, or other footwear the heels of which have been or shall be compressed or prepared by the lessee in whole or in part, or have been or shall be attached by the aid of any "heeling" machinery not held by the lessee under lease from the lessor.

Six. The lessee, as rent or royalty for the leased machinery, shall purchase exclusively of the lessor or its authorized agents, at the prices from time to time established by the lessor, all eyelets used by him in or in connection with the leased machinery, and shall pay therefor upon the regular terms established by the lessor therefor.

Seven. The lessor may attach to the leased machinery or any thereof an indicator or indicators to register the number of revolu-

tions or movements of any part or parts thereof, and the lessee shall not allow any person (other than the the lessor or its agents) to disturb or interfere with such indicator or indicators. In case any indicator thus attached shall from any cause cease to correctly indicate or register, or shall be disturbed or out of repair, or if the glass covering any such indicator shall be removed or broken or injured, then and as often as the same shall happen the lessee shall immediately, by writing, notify the lessor, and at the same time explain the circumstances under which the same has happened. The lessee shall keep full and accurate accounts, independently of any indicators that may be placed upon the leased machinery, showing the number of boots, shoes, footwear, and other articles, or portions thereof in the manufacture or preparation of which the leased machinery or any part thereof shall have been used, and shall allow the lessor at all times by its agents or attorneys to examine and to take copies of such accounts and entries of the lessee as may determine the total number of boots, shoes, footwear, and other articles, or portions thereof, made or prepared or operated upon by the aid of the leased machinery or any part thereof, and the lessee shall produce all such accounts and entries upon request. The lessee shall also furnish any further information which may be called for in relation to the leased machinery or the use thereof.

And that the following stipulations and provisions are agreed to: —

Eight. The term of this agreement shall be seventeen years from the date hereof. The lease of the leased machinery and license to use the same hereby granted shall continue, unless sooner terminated by the lessor because of breach thereof on the part of the lessee, or otherwise as herein provided, for the full term of this agreement; but in case at any time the lessee shall discontinue or suspend the operation of said factory, or shall discontinue or suspend the manufacture in said factory in the regular course of business of articles in the manufacture of which the leased machinery can be used, or if at any time or for any reason the lessee shall fail or cease to make regular use of the leased machinery in the ordinary course of business, then the lessor shall have the right at its option,

by notice in writing to the lessee, to terminate forthwith the lease and license hereby granted, and in case at any time any breach or default shall be made in the observance of any one or more of the conditions in this agreement contained or contained in any other lease or license agreement subsisting between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise and expressed to be obligatory upon the lessee, the lessor shall have the right by notice in writing to the lessee to terminate forthwith any or all leases of or licenses to use machinery then in force between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, and this notwithstanding that previous breaches or defaults may have been unnoticed, waived, or condoned by or on behalf of the lessor. If, upon the expiration of the full term of this agreement, the lessor does not request the return of the leased machinery, then the leased machinery shall continue to be held and used under and in accordance with the conditions, stipulations and provisions in this agreement contained and this agreement and the lease and license herein contained shall thereupon be extended indefinitely as to term; but thereafter either the lessee or the lessor, upon sixty days' notice in writing to the other, may terminate this agreement and the lease and license herein contained, whereupon the leased machinery shall be delivered forthwith to the lessor, as herein provided. Upon the expiration or termination of the lease hereby granted or any extension thereof by notice or by reason of any default on the part of the lessee as to the terms of this agreement or of any other lease or license agreement from the lessor or otherwise, in any manner whatsoever, the lessee shall forthwith at his own expense deliver the leased machinery to the lessor at Beverly, Massachusetts, complete and in good order, reasonable wear and tear alone excepted; and shall thereupon pay to the lessor such sum as may be necessary to put the leased machinery in suitable order and condition to lease to another lessee, and in addition thereto the lessee shall also, without prejudice to any other rights or remedies of the lessor hereunder, pay to the lessor the sum of One Hundred Dollars ($100) for each machine hereby leased as compensation for setting up the leased machinery

in his factory, for instructing operators, and for deterioration of the leased machinery; and the lessee for himself, his heirs, executors and administrators, hereby grants to the lessor, its successors and assigns, full right, power and authority to enter upon the premises and into any factory, room, or any place where the leased machinery, or any part thereof, may be, and take possession thereof, and take away the same.

Nine. A notice in writing, signed by the president, a vice-president, the treasurer or an assistant treasurer of the lessor or by any assignee of the lessor's rights hereunder and posted by prepaid letter, addressed to the lessee or delivered at his usual or last known place of abode or business, that the lease and license hereby granted is terminated or shall be terminated at the expiration of a certain period, shall be a sufficient termination of the lease and license from the time of posting or delivering such notice, or from the expiration of the period therein mentioned, as the case may be. Any termination of this agreement or of the lease and license hereby granted shall not release the lessee from his obligation to pay rent or royalty for the period prior to such termination, and shall be without prejudice to any other rights or remedies which the lessor may have for violation of contract, use of machines without right, or use of patented inventions without license.

Ten. The lessee admits the validity for the full term expressed in the grant thereof (and every extension and renewal thereof) of each and every of the Letters Patent of the United States of America owned by the lessor or under which it is licensed, any of the inventions of which are or hereafter may be embodied in the leased machinery. The lessee also agrees that he will not directly or indirectly infringe or contest the validity for the full term expressed in the grant thereof or of any extension or renewal thereof, of any of the Letters Patent referred to in the Schedule of Patents hereto annexed or the title of the lessor thereto. The expiration of this agreement or any extension thereof or the termination or cesser of the lease and license hereby granted shall not in way affect the provisions of this clause, or release or discharge the lessee from the admissions and estoppels herein set forth.

Eleven. None of the conditions, stipulations or provisions of

this agreement shall be held to have been waived by any act or knowledge of the lessor, its agents or employees, but only by an instrument in writing, signed by the president, a vice-president or the treasurer of the lessor.

Twelve. The term "lessor" shall include the said United Shoe Machinery Company and its successors and assigns. All the conditions, stipulations and provisions binding on the lessee shall be binding on and enforceable against his legal representatives. In the construction of this instrument, words relating to the number and gender of the parties shall be read according to their real number and gender.

In witness whereof, the parties hereto have duly executed this instrument in duplicate, the day and year first above written.

PLAINTIFF'S EXHIBIT 44.

[Put in Evidence, page 394.]

General Department. [1809]

Lease and License Agreement Number .

This Agreement made at Boston, in the State of Massachusetts, this day of 19 , between the United Shoe Machinery Company, a corporation organized under the laws of the State of New Jersey, having an office in said Boston, hereinafter referred to as the lessor, of the one part, and of in the State of , hereinafter referred to as the lessee, of the other part:

Witnesseth, that the lessor in consideration of the covenants and agreements on the part of the lessee herein contained, does hereby lease to and license the lessee under any letters patent belonging to the lessor or under which the lessor has the right to grant such license affecting any inventions which are now or hereafter shall be embodied therein or employed in the operation thereof, to use

Ideal Clicking Machine(s), No(s).

and any duplicate parts, extras, mechanisms and devices relating thereto, or used in connection therewith, now attached to or delivered with the said designated machine or machines, or which may at any time hereafter be obtained from the lessor, or be added thereto by or with the consent of the lessor, and also the Clicking Machine dies of the lessor now, heretofore or hereafter delivered to the lessee subject to the conditions hereinafter contained.

The term "leased machinery" wherever used herein shall be construed to include the whole of the machine or machines hereby leased, and all said duplicate parts, extras, mechanisms and devices except dies.

The term "Clicking Machine dies of the lessor" wherever used herein shall be construed to include all Clicking Machine dies originally manufactured or supplied by the lessor and obtained by the lessee either directly from the lessor or from another lessee of the lessor's Clicking Machines.

And that the following are agreed to as conditions of this agreement, all of which the lessee covenants and agrees to keep and perform:—

One. The leased machinery shall at all times remain and be the sole and exclusive property of the lessor, and the lessee shall have no right of property therein, but only the right to use the same upon the conditions herein contained. The leased machinery shall be used only by the lessee himself, or by operatives in his direct employ, and only in the factory now occupied by him at in the State of , unless the lessor shall by an instrument in writing signed by its president, vice-president or treasurer, authorize the lessee to remove the leased machinery and to use the same elsewhere. The leased machinery shall not be transferred or delivered or sublet to any other person or corporation, and neither this agreement nor the lease nor the license hereby granted can be assigned by the lessee by his own act or by operation of law. **Clicking Machine dies of the lessor shall be used only in connection with Ideal Clicking Machines held by the lessee under lease from the lessor; but the same may be transferred by the lessee to any other lessee of the lessor's Clicking Machines, subject, however, to the conditions of the lease or leases under which such Clicking Machines are held by such other lessee.** If the lessee becomes insolvent or bankrupt, or has a receiving order made against him, or makes or executes any bill of sale, deed of trust or assignment for the benefit of his creditors, or if a sale, mortgage, lease or unauthorized removal of the leased machinery, or any part thereof, be made or attempted, or if any distress or execution or attachment be levied thereon, then and in each such case any or all leases of or licenses to use machinery then existing between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, shall at the option of the lessor cease and determine, and the possession of and full right to and control of all machinery the leases or licenses of which are so terminated, shall thereupon revest in the lessor free from all claims and demands whatsoever. The lessor and its agents and employees shall at all times be given access to the leased machinery for the purpose of inspecting it or watching its use and operation, or of altering, repairing, improving, or adding to it, or determining the nature or extent of its use, and the lessee shall afford all reasonable facilities therefor.

Two. The lessee shall at all times and at his own expense keep the leased machinery in good and efficient working order and condition, and shall not permit any one to injure or deface or remove any plate, or dates, numbers, or other inscriptions now or hereafter impressed on or affixed to the leased machinery or to the Clicking Machine dies of the lessor. The lessee shall obtain from the lessor exclusively, and shall pay therefor at the regular prices from time to time established by the lessor, all the duplicate parts, extras, mechanisms and devices of every kind needed or used in operating, repairing, or renewing the leased machinery, and the same shall form part of the leased machinery, and the lessee shall not otherwise make or allow to be made any addition, subtraction or alteration to, from, or in the leased machinery, or interfere with the proper operation of the same.

Three. The leased machinery shall at all times, until the expiration or termination of the lease thereof and license to use the same hereby granted and the re-delivery of the leased machinery into the possession of the lessor as hereinafter provided, be held at the sole risk of the lessee from injury, loss, or destruction, and in case any machine or machines hereby leased shall be destroyed by fire or otherwise before such expiration or termination and re-delivery, the lessee shall pay to the lessor upon demand the sum of One Hundred and Fifty Dollars ($150) in respect to each machine so destroyed as partial reimbursement to the lessor for such destruction, and the lessee shall forthwith return whatever remains of all the machinery so destroyed to the lessor, at Beverly, Massachusetts.

Four. The lessee shall pay all taxes and assessments which shall be assessed in respect to the leased machinery and dies or other machinery of the lessor held by the lessee under lease or license upon whomsoever assessed. All taxes or assessments in respect to leases, licenses or agreements covering machinery, or the rights to payments thereunder, shall be construed, for the purposes of this article, to be assessed in respect to the machinery itself. In case at any time any unapportioned tax or assessment shall be assessed to the lessor in respect in part, but not wholly, to machinery of the

lessor in the possession of the lessee the lessee shall pay to the lessor such proportionate part of the total amount of said unapportioned tax or assessment as the fair valuation, to be determined by the lessor, of said machinery of the lessor in the possession of the lessee bears to the fair valuation, to be determined by the lessor, of all machinery (excepting machinery, if any, in the lessor's own possession) in respect to which the unapportioned tax or assessment has been assessed; provided, however, that if such unapportioned tax or assessment includes any or assessment in respect to tangible property in the lessor's own possession the amount thereof, based, at the established rate, upon the fair valuation, to be determined by the lessor, of such property, shall first be deducted and the lessee shall pay his proportionate part as aforesaid of the balance only of said unapportioned tax or assessment after such deduction has been made.

Five. The leased machinery shall be used for no other purpose than for cutting out the parts of footwear made by or for the lessee, which are cut from materials other than sole leather, and for that purpose the lessee shall use the leased machinery to its full capacity limited only by the amount of work of the kind which the leased machinery is designed to perform done by or for the lessee by the aid of machinery. The leased machinery shall not be used for cutting sole leather.

Six. The lessee shall pay to the lessor on the last day of each calendar month the amount or amounts set forth in the following Schedule of Payments in respect to each pair of footwear of a kind or kinds therein specified cut during the preceding calendar month in whole or in part by the aid of any clicking machine or machines held by the lessee under lease from the lessor or by the aid of any Clicking Machine dies of the lessor.

SCHEDULE OF PAYMENTS.

	Per Pair.
For all footwear which is lasted by machinery not held by the lessee under lease from the lessor . .	1 cent
For all welted footwear which is welted or stitched by machinery not held by the lessee under lease from the lessor	6 cents

For all turned footwear the soles of which are sewed to their uppers by machinery not held by the lessee under lease from the lessor . . . . . 1¾ cents

Provided, however, that in all cases when the lessee shall pay to the lessor on or before the fifteenth day of the calendar month the amount due to the lessor under the provisions of this paragraph for the next preceding calendar month, the lessor will in consideration of such prompt payment grant a discount of fifty per cent. from the amount due for such preceding calendar month.

Seven. The lessee shall also pay to the lessor an amount equal to five cents for each inch of cutting edge of all dies (other that Clicking Machine dies of the lessor) which are used in or in connection with the leased machinery or which during the continuance of any lease between the lessee and the lessor covering any one or more Clicking Machines are manufactured or obtained by or for the lessee which are adapted for use in or in connection with the leased machinery for any purpose sor which the leased machinery is hereby licensed. Said amount in respect to any such dies now in the possession of or in the factory of the lessee shall be due and payable forthwith, and in respect to all such dies hereafter manufactured or obtained by or for the lessee shall be due and payable immediately upon the manufacture or obtaining thereof by or for the lessee, as the case may be. The lessee shall forthwith notify the lessor in writing of any and all such dies now in the possession of or in the factory of the lessee, and at any and all times hereafter upon any such dies coming into the possession of or the factory of the lessee by manufacture, purchase, or otherwise the lessee shall likewise notify the lessor in writing. The notices by the lessee to the lessor herein provided for shall give to the lessor all such information as may be necessary for the lessor to determine the amount due to the lessor in respect to any and all such dies, and, if the lessor so desires, the lessee shall permit the lessor to examine and measure the same. Excepting Clicking Machine dies of the lessor, the lessee agrees that he will not use or permit to be used in or in connection with the leased machinery or in or in connection with any Clicking machinery held by the lessee under any lease or license

or agreement from the lessor any dies in respect to which the lessee has not paid to the lessor five cents per inch for each inch of cutting edge thereof.

Eight. The lessor may attach to the leased machinery, or any thereof, an indicator or indicators to register the number of revolutions or movements of any part or parts thereof, and the lessee shall not allow any person (other than the lessor or its agents) to disturb or interfere with any such indicator or indicators. In case any indicator thus attached shall from any cause cease to correctly indicate or register, or shall be disturbed or out of repair, or if the glass covering any such indicator shall be removed or broken or injured, then and as often as the same shall happen the lessee shall immediately by writing notify the lessor, and at the same time explain the circumstances under which the same has happened. In case any such indicator ceases to indicate, or becomes or remains inaccurate, or the glass covering becomes or remains removed, broken, or injured, because of any fault of the lessee or any one in his employ, or because of the failure of the lessee to give promptly the notice hereinbefore provided for, then, without any prejudice to other rights or remedies of the lessor hereunder, the lessee shall pay the lessor as rent or royalty, without the right to any discount, the sum of seven cents per pair for each pair of footwear, or portions thereof, in the manufacture or preparation of which the leased machinery or any part thereof shall have been used. The lessee shall, if so requested by the lessor, keep full and accurate accounts, independently of any indicators that may be placed upon the leased machinery, showing the amount of footwear, or portions thereof, in the manufacture or preparation of which the leased machinery or any part thereof or Clicking Machine dies of the lessor shall have been used, and shall allow the lessor at all times, by its agents or attorneys, to examine and to take copies of such accounts and entries of the lessee as may serve to determine the total amount of footwear, or portions thereof, made or prepared by the aid of the leased machinery or any part thereof, or by the aid of the Clicking Machine dies of the lessor, and the lessee shall produce all such accounts and entries upon request. The lessee shall also, if so requested by the

lessor, require each of his operators to keep upon blanks or blank-books to be furnished by the lessor accurate daily records of the amount of footwear, or portions thereof, in the making or preparation of which he has used the leased machinery or any part thereof, or Clicking Machine dies of the lessor, and shall require his operators to sign such records, and, if requested so to do by the lessor, shall verify the same under oath. The lessee shall send to the office of the lessor in Boston, on or before the fifth day of each calendar month, the original records for the next preceding calendar month kept by his operators as above provided for; and in case, in any calendar month, any one or more of the machines hereby leased has been entirely idle, the lessee, on or before the fifth day of the next succeeding calendar month, shall send to the office of the lessor in Boston the blank for said month for each such idle machine marked "not in use" and signed by the lessee. The lessee shall also furnish any further information which may be called for in relation to the leased machinery or the use thereof.

And that the following stipulations and provisions are agreed to: —

Nine. If at any time the lessee shall fail or cease to use exclusively Clicking Machines held by him under lease from the lessor for cutting all footwear made by or for him, which is cut by the aid of machinery, the lessor, although it may have waived or ignored prior instances of such failure or cessation, may at its option terminate forthwith by notice in writing any or all leases of or licenses to use Clicking Machines then existing between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise; and the possession of and full right to and control of all machinery the leases or licenses of which are so terminated shall thereupon revest in the lessor free from all claims and demands whatsoever.

Ten. The term of this agreement shall be seventeen years from the date hereof. The lease of and license to use the leased machinery and Clicking Machine dies of the lessor hereby granted shall continue, unless sooner terminated by the lessor because of breach thereof on the part of the lessee, or otherwise as in this

agreement provided, for the full term of this agreement. But if any breach or default shall be made in the observance of any one or more of the conditions in this agreement contained or contained in any other lease or license agreement subsisting between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, and expressed to be obligatory upon the lessee, the lessor shall have the right, by notice in writing to the lessee, to terminate forthwith any or all leases of or licenses to use machinery then in force between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, and this notwithstanding that previous breaches or defaults may have been unnoticed, waived, or condoned by or on behalf of the lessor. If, upon the expiration of the full term of this agreement, the lessor does not request the return of the leased machinery, then the leased machinery and dies shall continue to be held and used under and in accordance with the conditions, stipulations, and provisions in this agreement contained, and this agreement and the lease and license herein contained shall thereupon be extended indefinitely as to term; but thereafter either the lessee or the lessor, upon sixty days' notice in writing to the other, may terminate this agreement and the lease and license herein contained, whereupon the leased machinery shall be delivered forthwith to the lessor, as herein provided. Upon the expiration or termination of this agreement or any extension thereof or of the lease and license herein contained, by notice or by reason of any default on the part of the lessee as to the terms of this agreement or any other lease or license agreement from the lessor or otherwise, in any manner whatsoever, the lessee shall forthwith deliver the leased machinery to the lessor at Beverly, Massachusetts, complete and in good order, reasonable wear and tear alone excepted; and shall thereupon pay to the lessor without prejudice to any other rights or remedies of the lessor the sum of One Hundred Dollars ($100) in respect to each machine hereby leased as partial reimbursement to the lessor for deterioration of the leased machinery, expenses in connection with the installation thereof and instruction of operators; and the lessee, for himself, his heirs, executors and administrators, successors and

assigns, hereby grants to the lessor, its successors and assigns, full right, power and authority to enter upon the premises and into any factory, room, or any place where the leased machinery or any part thereof may be, and take possession thereof, and take away the same; and in no case shall the lessee have any claim for the repayment or offset of any sum or sums, or any part thereof, which shall have been paid under this agreement or in respect to the lease or license herein contained or in any wise in respect to the leased machinery or dies.

Eleven. In case at any time the lessee shall have in his possession more Clicking Machines than in the opinion of the lessor are necessary for the lessee's work and the lessor shall notify the lessee in writing requesting the return of one or more such Clicking Machines, the lessee shall either return to the lessor at Beverly, Massachusetts, or at the leesee's election may retain such machines upon a monthly rental for each such machine of one dollar per month, payable upon the fifteenth day of each month. In case such excess machines shall be returned by the lessee to the lessor in accordance with the provisions of this Article only and without breach or default by the lessee in respect to any of the conditions, stipulations or provisions of this agreement or of any other lease or license agreement between the lessee and the lessor, the lessee shall pay to the lessor such sum as may be necessary to put the machine or machines so returned in suitable order and condition to lease to another lessee and shall not be required to make the payment provided for in Article Ten hereof. In case the lessee elects to retain such machines upon rental as aforesaid, such rental shall continue until such time as the lessee shall either return the same to the lessor at said Beverly or the lessor shall notify the lessee that such payment may be discontinued.

The provisions of this article hereof are independent of and in addition to all other rights of the lessor hereunder.

Twelve. A notice in writing, signed by the president, a vice-president, the treasurer or an assistant treasurer of the lessor, or by any assignee of the lessor's rights hereunder and posted by prepaid letter, addressed to the lessee or delivered at his usual or last

known place of abode or business, that the lease and license hereby granted is terminated or shall be terminated at the expiration of a certain period, shall be a sufficient termination of the lease and license from the time of posting or delivering such notice, or from the expiration of the period therein mentioned, as the case may be. Any termination of this agreement or of the lease and license hereby granted shall not release the lessee from his obligation to pay rent or royalty for the period prior to such termination and shall be without prejudice to any rights or remedies which the lessor may have for violation of contract, use of machines without right, or use of patented inventions without license.

Thirteen. The lessee admits the validity for the full term expressed in the grant thereof (and every extension and renewal thereof) of each and every of the Letters Patent of the United States of America, owned by the lessor or under which it is licensed, any of the inventions of which are or hereafter may be embodied in the leased machinery or dies. The lessee also agrees that he will not directly or indirectly infringe or contest the validity for the full term expressed in the grant thereof or of any extension or renewal thereof, of any of the Letters Patent referred to in the Schedule of Patents hereto annexed or the title of the lessor thereto. The expiration of this agreement or any extension thereof or the termination or cesser of the lease and license hereby granted shall not in any way affect the provisions of this clause, or release or discharge the lessee from the admissions and estoppels herein set forth.

Fourteen. None of the conditions, stipulations or provisions of this agreement shall be held to have been waived by any act or knowledge of the lessor, its agents or employees, but only by an instrument in writing, signed by the president, a vice-president, or the treasurer of the lessor.

Fifteen. The term "lessor" shall include the said United Shoe Machinery Company and its successors and assigns. All the conditions, stipulations and provisions binding on the lessee shall be binding on and enforceable against his legal representatives. In the construction of this instrument, words relating to the number

and gender of the parties shall be read according to their real number and gender.

In witness whereof, the parties hereto have duly executed this instrument in duplicate, the day and year first above written.

Lease and License Number .

Davey Pegging Machine.

This Lease and Agreement made at Boston, in the State of Massachusetts, this day of 19 , between the United Shoe Machinery Company, a corporation organized under the laws of the State of New Jersey, having an office in said Boston, hereinafter referred to as the lessor, of the one part, and of in the State of , hereinafter referred to as the lessee, of the other part:

Witnesseth, that the lessor, in consideration of the covenants and agreements on the part of the lessee herein contained, does hereby lease to and license the lessee under any letters patents belonging to the lessor or under which the lessor has the right to grant such license affecting any inventions which are now or hereafter shall be embodied therein, to use

Davey Pegging Machine No.

now or hereafter delivered to the lessee and any duplicate parts, extras, mechanisms and devices relating thereto, or used in connection therewith, now attached to or delivered with the said designated machine or which may at any time hereafter be obtained from the lessor, or be added thereto by or with the consent of the lessor (which machine, together with all duplicate parts, extras, mechanisms and devices, held by the lessee under these presents, whether now or hereafter delivered to or in the possession of the lessee, is hereinafter referred to as the "leased machinery"), subject to the conditions hereinafter contained.

And that the following are agreed to as conditions of the lease and license of the leased machinery, all of which the lessee covenants and agrees to keep and perform: —

One. The leased machinery shall at all times remain and be the sole and exclusive property of the lessor, and the lessee shall have no right of property therein, but only the right to use the same, upon the conditions herein contained. The leased machinery shall

be used only by the lessee himself, or by operatives in his direct employ, and only in the factory now occupied by him at in the State of . The leased machinery shall not be transferred or delivered or sublet to any other person or corporation, and neither the lease nor the license hereby granted can be assigned by the lessee by his own act or by operation of law. If the lessee becomes insolvent or bankrupt, or has a receiving order made against him, or makes or executes any bill of sale, deed of trust or assignment for the benefit of his creditors, or if a sale, mortgage, lease or removal of the leased machinery, or any part thereof, be made or attempted, or if any distress or execution or attachment be levied thereon, then and in each such case any or all leases of or licenses to use machinery then existing between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, shall at the option of the lessor cease and determine, and the possession of and full right to and control of all machinery the leases or licenses of which are so terminated, shall thereupon revest in the lessor free from all claims and demands whatsoever. The lessor and its agents and employees shall at all times be given access to the leased machinery for the purpose of inspecting it or watching its use and operation, or of altering, repairing, improving, or adding to it, or determining the nature or extent of its use, and the lessee shall afford all reasonable facilities therefor.

Two. The lessee shall at all times and at his own expense keep the leased machinery in good and efficient working order and condition, and shall not permit any one to injure or deface or remove any plate, or dates, numbers, or other inscriptions now or hereafter impressed on or affixed to the leased machinery by the lessor. The lessee shall obtain from the lessor exclusively, and shall pay therefor at the regular prices from time to time established by the lessor, all the duplicate parts, extras, mechanisms and devices, of every kind needed or used in operating, repairing, or renewing the leased machinery, and the same shall form part of the leased machinery, and the lessee shall not otherwise make or allow to be made any addition, subtraction or alteration to, from, or in the

leased machinery nor interfere with the proper operation of the same.

Three. The leased machinery shall at all times, until the expiration or termination of the lease thereof and license to use the same hereby granted and the re-delivery of the leased machinery into the possession of the lessor as hereinafter provided, be held at the sole risk of the lessee from injury, loss or destruction, and in case the same shall be destroyed by fire or otherwise before such expiration or termination and re-delivery, the lessee shall pay to the lessor the sum of Two Hundred Dollars ($200) as partial reimbursement to the lessor for such destruction, and the lessee shall forthwith return whatever remains of the leased machinery to the lessor at Beverly, Massachusetts.

Four. The lessee shall pay all taxes and assessments which shall be assessed in respect to the leased machinery or other machinery of the lessor held by the lessee under lease or license upon whomsoever assessed. All taxes or assessments in respect to leases, licenses or agreements covering machinery, or the rights to payments thereunder, shall be construed, for the purposes of this article, to be assessed in respect to the machinery itself. In case at any time any unapportioned tax or assessment shall be assessed to the lessor in respect in part but not wholly to machinery of the lessor in the possession of the lessee the lessee shall pay to the lessor such proportionate part of the total amount of said unapportioned tax or assessment as the fair valuation, to be determined by the lessor, of said machinery of the lessor in the possession of the lessee bears to the fair valuation, to be determined by the lessor, of all machinery (excepting machinery, if any, in the lessor's own possession) in respect to which the unapportioned tax or assessment has been assessed; provided, however, that if such unapportioned tax or assessment includes any tax or assessment in respect to tangible property in the lessor's own possession the amount thereof, based, at the established rate, upon the fair valuation, to be determined by the lessor, of such property, shall first be deducted and the lessee shall pay his proportionate part as aforesaid of the

balance only of said unapportioned tax or assessment after such deduction has been made.

Five. The lessee shall use the leased machinery to its full capacity on all boots, shoes, and other footwear made in his factory which are or are to be pegged, except that the leased machinery shall not, nor shall any part thereof, be used in the manufacture of any boots, shoes, or other footwear which have been or shall be lasted on machines not held by the lessee under lease from the lessor, or in the manufacture of any boots, shoes or other footwear which have been or shall be slugged, heel seat nailed, or otherwise partly made by the aid of any "Metallic" machinery not held by the lessee under lease from the lessor.

Six. The lessee shall pay to the lessor on the last day of each calendar month as rent or royalty the sum of two (2) cents for each pair of men's and boys' and the sum of one and one half (1½) cents for each pair of women's, misses', youths' and children's boots, shoes or other footwear, or portions thereof, pegged or manufactured or prepared during the next preceding calendar month in any way, whether wholly or in part, by the aid of any leased machinery or any part thereof: **provided, however, that in all cases when the lessee shall pay to the lessor on or before the fifteenth day of the calendar month the rent or royalty due for the use of the leased machinery for the next preceding calendar month, the lessor will in consideration of such prompt payment grant a discount of fifty per cent. from such rent or royalty due for such preceding calendar month.** The lessee guarantees that the rent or royalty herein provided (less all abatements) shall amount in each calendar year, ending December 31, to at least ten (10) dollars for each calendar month and at the end of each such calendar year the lessee shall pay to the lessor the amount, if any, by which the rent or royalty paid for said year is less than such guaranteed rent or royalty: provided, however, that if in any calendar year the factory of the lessee remains wholly idle for any entire calendar month, then the amount of rent or royalty guaranteed for that year shall be reduced by one twelfth for each such month that the factory thus remains wholly idle.

Seven. The lessor may attach to the leased machinery or any thereof an indicator or indicators to register the number of revolutions or movements of any part or parts thereof, and the lessee shall not allow any person (other than the lessor or its agents) to disturb or interfere with such indicator or indicators. In case any indicator thus attached shall from any cause cease to correctly indicate or register, or shall be disturbed or out of repair, or if the glass covering any such indicator shall be removed or broken or injured, then and as often as the same shall happen the lessee shall immediately by writing notify the lessor and at the same time explain the circumstances under which the same has happened. In case any such indicator ceases to indicate, or becomes or remains inaccurate, or the glass covering becomes or remains removed, broken or injured, because of any fault of the lessee or any one in his employ, or because of the failure of the lessee to give promptly the notice hereinbefore provided for, then, without prejudice to any other rights of the lessor hereunder, the lessee shall pay the lessor, as rent or royalty without the right to any discount, two cents per pair for each pair of boots, shoes, or other footwear or portions thereof in the manufacture of which the leased machinery or any part thereof shall have been used. The lessee shall keep full and accurate accounts indep ndently of any indicators that may be placed upon the leased machinery, showing the number of each kind of boots, shoes, and other footwear, or portions thereof, in the manufacture of which the leased machinery or any part thereof shall have been used, and shall allow the lessor at all times, by its agents or attorneys, to examine and to take copies of such accounts and entries of the lessee as may serve to determine the total number of boots, shoes or other footwear or portions thereof made by the aid of the leased machinery or any part thereof, and the lessee shall produce all such accounts and entries upon request. The lessee shall require each of his operators upon the leased machinery or any part thereof to keep upon blanks or blank books to be furnished by the lessor accurate daily records of the number of each kind of boots, shoes and other footwear, or portions thereof, in the making of which he has used the leased machinery or any part

thereof, and shall require his operators to sign such records, and if requested so to do by the lessor, shall verify the same under oath. The lessee shall send to the office of the lessor in Boston, on or before the fifth day of each calendar month, the original records for the next preceding calendar month kept by his operators as above provided for; and in case, in any calendar month, none of the leased machinery has been used, the lessee, on or before the fifth day of the next succeeding calendar month shall send to the office of the lessor in Boston the blank for said month marked "not in use," and signed by the lessee. The lessee shall also furnish any further information which may be called for in relation to the leased machinery or the use thereof.

And that the following agreements, stipulations and provisions are agreed to: —

Eight. If at any time the lessee shall fail or cease to use exclusively pegging machinery held by him under lease from the lessor for pegging all boots, shoes, and other footwear made by or for him which are pegged by the aid of machinery, the lessor, although it may have waived or ignored prior instances of such failure or cessation, may, at its option, terminate forthwith by notice in writing any or all leases of or licenses to use "Pegging Machine Department" machinery, then existing between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, and the possession of and full right to and control of machinery the lease or license of which is so terminated shall thereupon revest in the lessor free from all claims and demands whatsoever.

Nine. This lease and license shall continue, unless sooner terminated by the lessor because of breach thereof on the part of the lessee, or otherwise as herein provided, for seventeen years from the date hereof. But if any breach or default shall be made in the observance of any one or more of the conditions herein contained or contained in any other lease or license agreement subsisting between the lessor and the lessee whether as the result of assignment to the lessor or otherwise and expressed to be obligatory upon the lessee, the lessor shall have the right, by notice in writing to the lessee, to terminate forthwith any or all leases of or

licenses to use machinery then in force between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, and this notwithstanding that previous breaches or defaults may have been unnoticed, waived or condoned by or on behalf of the lessor. If, upon the expiration of the full term of this lease, the lessor does not request the return of the leased machinery, then the leased machinery shall continue to be held and used under and in accordance with the conditions of this lease and license, which shall thereupon be extended indefinitely as to term; but thereafter either the lessee or the lessor, upon sixty days' notice in writing to the other, may terminate this lease and license, whereupon the leased machinery shall be delivered forthwith to the lessor, as herein provided. Upon the expiration of this lease and license or any extension thereof or its termination by notice or by reason of any default on the part of the lessee as to the terms of this lease and license or any other lease or license from the lessor or otherwise in any manner whatsoever, the lessee shall forthwith deliver the leased machinery to the lessor at Beverly, Massachusetts, in good order, reasonable wear and tear alone excepted; and shall thereupon pay to the lessor without prejudice to any other rights or remedies of the lessor the sum of Two Hundred Dollars ($200) as partial reimbursement to the lessor for deterioration of the leased machinery, expenses in connection with the installation thereof and instruction of operators; and the lessee for himself, his heirs, executors and administrators, successors and assigns, hereby grants to the lessor, its successors and assigns, full right, power, and authority to enter upon the premises and into any factory, room, or any place where the leased machinery or any part thereof may be, and take possession thereof, and take away the same; and the lessee shall have no claim for the repayment or offset of any sum or sums, or any part thereof, which shall have been paid in any wise in respect to this lease and license or the leased machinery.

Ten. A notice in writing, signed by the president, a vice-president, the treasurer or an assistant treasurer of the lessor or by any assignee of the lessor's rights hereunder and posted by prepaid

letter, addressed to the lessee or delivered at his usual or last known place of abode or business, that the lease and license hereby granted is determined or shall be determined at the expiration of a certain period, shall be a sufficient determination of the lease and license from the time of posting or delivering such notice, or from the expiration of the period therein mentioned, as the case may be. Any termination of this lease and license shall not release the lessee from his obligation to pay rent or royalty for the period prior to such termination, and shall be without prejudice to any other rights or remedies which the lessor may have for violation of contract, use of machines without right or use of patented inventions without license.

Eleven. The lessee admits the validity for the full term expressed in the grant thereof (and every extension and renewal thereof) of each and every of the Letters Patent of the United States of America, owned by the lessor or under which it is licensed, any of the inventions of which are or hereafter may be embodied in the leased machinery. The lessee also agrees that he will not directly or indirectly infringe or contest the validity for the full term expressed in the grant thereof or of any extension or renewal thereof, of any of the Letters Patent referred to in the Schedule of Patents hereto annexed or the title of the lessor thereto. The expiration of this lease and license or any extension thereof or its termination or cesser shall not in any affect the provisions of this clause, or release or discharge the lessee from the admissions and estoppels herein set forth.

Twelve. None of the terms or conditions of this lease and license shall be held to have been waived by any act or knowledge of the lessor, its agents or employees, but only by an instrument in writing, signed by the president, a vice-president or the treasurer of the lessor.

Thirteen. The term "lessor" shall include the said United Shoe Machinery Company and its successors and assigns. All the conditions and agreements binding on the lessee shall be binding on and enforceable against his legal representatives. In the construction of this instrument, words relating to the number and gen-

der of the parties shall be read according to their real number and gender.

In witness whereof, the parties hereto have duly executed this instrument in duplicate, the day and year first above written.

This Lease and Agreement made at Boston in the State of Massachusetts this day of 19 , between the United Shoe Machinery Company, a corporation organized under the laws of the State of New Jersey, having an office in said Boston, hereinafter referred to as the lessor, of the one part, and of in the State of , hereinafter referred to as the lessee, of the other part:

Witnesseth, that the lessor, in consideration of the covenants and agreements on the part of the lessee herein contained, does hereby lease to and license the lessee under any letters patent belonging to the lessor or under which the lessor has the right to grant such license affecting any inventions which are now or hereafter shall be embodied therein, to use

Davey Pegging Machine No. ,

now or hereafter delivered to the lessee and any duplicate parts, extras, mechanisms and devices relating thereto, or used in connection therewith, now attached to or delivered with the said designated machine or which may at any time hereafter be obtained from the lessor, or be added thereto by or with the consent of the lessor (which machine, together with all duplicate parts, extras, mechanisms and devices, held by the lessee under these presents, whether now or hereafter delivered to or in the possession of the lessee, is hereinafter referred to as the "leased machinery"), subject to the conditions hereinafter contained.

And that the following are agreed to as conditions of the lease and license of the leased machinery, all of which the lessee covenants and agrees to keep and perform:—

One. The leased machinery shall at all times remain and be the sole and exclusive property of the lessor, and the lessee shall have no right of property therein, but only the right to use the

same, upon the conditions herein contained. The leased machinery shall be used only by the lessee himself, or by operatives in his direct employ, and only in the factory now occupied by him at in the State of unless the lessor shall by an instrument in writing signed by its president, vice-president or treasurer authorize the lessee to remove the leased machinery and to use the same elsewhere. The leased machinery shall not be transferred or delivered or sublet to any other person or corporation, and neither the lease nor the license hereby granted can be assigned by the lessee by his own act or by operation of law. If the lessee becomes insolvent or bankrupt, or has a receiving order made against him, or makes or executes any bill of sale, deed of trust or assignment for the benefit of his creditors, or if a sale, mortgage, lease or removal of the leased machinery, or any part thereof, be made or attempted, or if any distress or execution or attachment be levied thereon, then and in each such case any or all leases of or licenses to use machinery then existing between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, shall at the option of the lessor cease and determine, and the possession of and full right to and control of all machinery the leases or licenses of which are so terminated, shall thereupon revest in the lessor free from all claims and demands whatsoever. The lessor and its agents and employees shall at all times be given access to the leased machinery for the purpose of inspecting it or watching its use and operation, or of altering, repairing, improving, or adding to it, or determining the nature or extent of its use, and the lessee shall afford all reasonable facilities therefor.

Two. The lessee shall at all times and at his own expense keep the leased machinery in good and efficient working order and condition, and shall not permit any one to injure or deface or remove any plate, or dates, numbers, or other inscriptions now or hereafter impressed on or affixed to the leased machinery by the lessor. The lessee shall obtain from the lessor exclusively, and shall pay therefor at the regular prices from time to time established by the lessor, all the duplicate parts, extras, mechanisms and devices of every kind needed or used in operating, repairing, or renewing the

leased machinery, and the same shall form part of the leased machinery, and the lessee shall not otherwise make or allow to be made any addition, subtraction or alteration to, from, or in the leased machinery nor interfere with the proper operation of the same.

Three. The leased machinery shall at all times, until the expiration or termination of the lease thereof and license to use the same hereby granted and the re-delivery of the leased machinery into the possession of the lessor as hereinafter provided, be held at the sole risk of the lessee from injury, loss or destruction, and in case the same shall be destroyed by fire or otherwise before such expiration or termination and re-delivery, the lessee shall pay to the lessor upon demand the sum of Two Hundred Dollars ($200) as partial reimbursement to the lessor for such destruction, and the lessee shall forthwith return whatever remains of the leased machinery to the lessor at Beverly, Massachusetts.

Four. The lessee shall pay all taxes and assessments which shall be assessed in respect to the leased machinery or other machinery of the lessor held by the lessee under lease or license upon whomsoever assessed. All taxes or assessments in respect to leases, licenses or agreements covering machinery, or the rights to payments thereunder, shall be construed, for the purposes of this article, to be assessed in respect to the machinery itself. In case at any time any unapportioned tax or assessment shall be assessed to the lessor in respect in part but not wholly to machinery of the lessor in the possession of the lessee the lessee shall pay to the lessor such proportionate part of the total amount of said unapportioned tax or assessment as the fair valuation, to be determined by the lessor, of said machinery of the lessor in the possession of the lessee bears to the fair valuation, to be determined by the lessor, of all machinery (excepting machinery, if any, in the lessor's own possession) in respect to which the unapportioned tax or assessment has been assessed; provided, however, that if such unapportioned tax or assessment includes any tax or assessment in respect to tangible property in the lessor's own possession the amount thereof, based, at the established rate, upon the fair valuation, to be determined

by the lessor, of such property, shall first be deducted and the lessee shall pay his proportionate part as aforesaid of the balance only of said unapportioned tax or assessment after such deduction has been made.

Five. The lessee shall use the leased machinery to its full capacity on all boots, shoes, and other footwear made in his factory which are or are to be pegged.

Six. The lessee shall pay to the lessor immediately after the execution hereof, as a lease premium, the sum of dollars, and the lessee shall also pay to the lessor on the last day of each calendar month as rent or royalty the sum of two (2) cents for each pair of men's and boys' and the sum of one and one half (1½) cents for each pair of women's, misses', youths' and children's boots, shoes, or other footwear, or portions thereof, pegged or manufactured or prepared during the next preceding calendar month in any way, whether wholly or in part, by the aid of the leased machinery or any part thereof; **provided, however, that in all cases when the lessee shall pay to the lessor on or before the fifteenth day of the calendar month the rent or royalty due for the use of the leased machinery for the next preceding calendar month, the lessor will in consideration of such prompt payment grant a discount of fifty per cent. from such rent or royalty due for such preceding calendar month.** The lessee guarantees that the rent or royalty herein provided (less all abatements) shall amount in each calendar year, ending December 31, to at least ten (10 dollars) for each calendar month and at the end of each such calendar year the lessee shall pay to the lessor the amount, if any, by which the rent or royalty paid for said year is less than such guaranteed rent or royalty: provided, however, that if in any calendar year the factory of the lessee remains wholly idle for any entire calendar month, then the amount of rent or royalty guaranteed for that year shall be reduced by one twelfth for each such month that the factory thus remains wholly idle, but such reduction shall not be allowed in respect to more than ten (10) months in any one year.

Seven. The lessor may attach to the leased machinery, or any thereof, an indicator or indicators to register the number of revolu-

tions or movements of any part or parts thereof, and the lessee shall not allow any person (other than the lessor or its agents) to disturb or interfere with any such indicator or indicators. In case any indicator thus attached shall from any cause cease to correctly indicate or register, or shall be disturbed or out of repair, or if the glass covering any such indicator shall be removed or broken or injured, then and as often as the same shall happen, the lessee shall immediately, by writing, notify the lessor, and at the same time explain the circumstances under which the same has happened. In case any such indicator ceases to indicate, or becomes or remains inaccurate, or the glass covering becomes or remains removed, broken, or injured, because of any fault of the lessee or any one in his employ, or because of the failure of the lessee to give promptly the notice hereinbefore provided for, then, without prejudice to any other rights of the lessor hereunder, the lessee shall pay the lessor, as rent or royalty without the right to any discount, two cents per pair for each pair of boots, shoes, or other footwear, or portions thereof, in the manufacture of which the leased machinery or any part thereof shall have been used. The lessee shall keep full and accurate accounts, independently of any indicators that may be placed upon the leased machinery, showing the number of each kind of boots, shoes, and other footwear, or portions thereof, in the manufacture of which the leased machinery or any part thereof shall have been used, and shall allow the lessor at all times, by its agents, or attorneys, to examine and to take copies of such accounts and entries of the lessee as may serve to determine the total number of boots, shoes, or other footwear or portions thereof made by the aid of the leased machinery or any part thereof, and the lessee shall produce all such accounts and entries upon request. The lessee shall require each of his operators upon the leased machinery or any part thereof to keep upon blanks or blank books to be furnished by the lessor accurate daily records of the number of each kind of boots, shoes, and other footwear, or portions thereof, in the making of which he has used the leased machinery or any part thereof, and shall require his operators to sign such records, and, if requested so to do by the lessor, shall verify the same

under oath. The lessee shall send to the office of the lessor in Boston, on or before the fifth day of each calendar month, the original records for the next preceding calendar month kept by his operators as above provided for; and in case, in any calendar month, none of the leased machinery has been used, the lessee on or before the fifth day of the next succeeding calendar month shall send to the office of the lessor in Boston the blank for said month marked "not in use," and signed by the lessee. The lessee shall also furnish any further information which may be called for in relation to the leased machinery or the use thereof.

And that the following agreements, stipulations, and provisions are agreed to: —

Eight. If at any time the lessee shall fail or cease to use exclusively pegging machinery held by him under lease from the lessor for pegging all boots, shoes, and other footwear made by or for him which are pegged by the aid of machinery, the lessor, although it may have waived or ignored prior instances of such failure or cessation, may, at its option, terminate forthwith by notice in writing any or all leases of or licenses to use "Pegging Machine Department" machinery, then existing between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, and the possession of and full right to and control of all machinery the lease or license of which is so terminated shall thereupon revest in the lessor free from all claims and demands whatsoever.

Nine. This lease and license shall continue, unless sooner terminated by the lessor because of breach thereof on the part of the lessee, or otherwise as herein provided, for seventeen years from the date hereof. But if any breach or default shall be made in the observance of any one or more of the conditions herein contained or contained in any other lease or license agreement subsisting between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, and expressed to be obligatory upon the lessee, the lessor shall have the right, by notice in writing to the lessee, to terminate forthwith any or all leases of or

licenses to use machinery then in force between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, and this notwithstanding that previous breaches or defaults may have been unnoticed, waived, or condoned by or on behalf of the lessor. If, upon the expiration of the full term of this lease, the lessor does not request the return of the leased machinery, then the leased machinery shall continue to be held and used under and in accordance with the conditions of this lease and license, which shall thereupon be extended indefinitely as to term; but thereafter either the lessee or the lessor, upon sixty days' notice in writing to the other, may terminate this lease and license, whereupon the leased machinery shall be delivered forthwith to the lessor, as herein provided. Upon the expiration of this lease and license or any extension thereof or its termination by notice or by reason of any default on the part of the lessee as to the terms of this lease and license or any other lease or license from the lessor or otherwise in any manner whatsoever, the lessee shall forthwith deliver the leased machinery to the lessor at Beverly, Massachusetts, in good order, reasonable wear and tear alone excepted; and shall thereupon pay to the lessor such sum as may be necessary to put the leased machinery in suitable order and condition to lease to another lessee; and the lessee, for himself, his heirs, executors and administrators, successors and assigns, hereby grants to the lessor, its successors and assigns, full right, power, and authority to enter upon the premises and into any factory, room, or any place where the leased machinery or any part thereof may be, and take possession thereof, and take away the same; and in no case shall the lessee have any claim for the repayment or offset of any sum or sums, or any part thereof, which shall have been paid in any wise in respect to this lease and license or the leased machinery.

Ten. A notice in writing, signed by the president, a vice-president, the treasurer or an assistant treasurer of the lessor, or by any assignee of the lessor's rights hereunder and posted by prepaid letter, addressed to the lessee or delivered at his usual or last known place of abode or business, that the lease and license hereby

granted is determined or shall be determined at the expiration of a certain period, shall be a sufficient determination of the lease and license from the time of posting or delivering such notice, or from the expiration of the period therein mentioned, as the case may be. Any termination of this lease and license shall not release the lessee from his obligation to pay rent or royalty for the period prior to such termination, and shall be without prejudice to any other rights or remedies which the lessor may have for violation of contract, use of machines without right, or use of patented inventions without license.

Eleven. The lessee admits the validity for the full term expressed in the grant thereof (and every extension and renewal thereof) of each and every of the Letters Patent of the United States of America, owned by the lessor or under which it is licensed, any of the inventions of which are or hereafter may be embodied in the leased machinery. The lessee also agrees that he will not directly or indirectly infringe or contest the validity for the full term expressed in the grant thereof or of any extension or renewal thereof, of any of the Letters Patent referred to in the Schedule of Patents hereto annexed or the title of the lessor thereto. The expiration of this lease and license or any extension thereof or its termination or cesser shall not in any way affect the provisions of this clause, or release or discharge the lessee from the admissions and estoppels herein set forth.

Twelve. None of the terms or conditions of this lease and license shall be held to have been waived by any act or knowledge of the lessor, its agents or employees, but only by an instrument in writing, signed by the president, a vice-president or the treasurer of the lessor.

Thirteen. The term "lessor" shall include the said United Shoe Machinery Company and its successors and assigns. All the conditions and agreements binding on the lessee shall be binding on and enforceable against his legal representatives. In the construction of this instrument, words relating to the number and gender of the parties shall be read according to their real number and gender.

In witness whereof, the parties hereto have duly executed this instrument in duplicate, the day and year first above written.

[RIDER ATTACHED TO THE FOLLOWING LEASE.]

[Duplicate. Form 107.]

Dated *Kansas City, Mo., Oct. 18*, 1899.

We hereby propose to take a lease of the machinery mentioned below, of the Gem Flexible Insole Company, according to the form of lease adopted by the Company therefor, and we agree to pay, upon delivery of the said machinery, the sum of $300.00 (as below) as consideration for the delivery of said lease, for the expenses of setting up said machinery, and for possession under the lease of said machinery.

One (1) Gem Flexible Insole Machine. *166*
One (1) Gem Lip Turner. *160*
One (1) Gem Cementer. *164*

It is understood and agreed that instead of cash on delivery, as provided for above, that we are to pay for the above machines Jan. 1st, 1900, or return machines to the Gem Flexible Insole Co.

Please answer these questions.	Answer here.
How shall we ship, by freight or express?	*Freight.*
What kind of goods do you make, men's or women's?	*Men's & Women's Goodyear Welts.*

No title to the above mentioned machinery is acquired other than is given in the lease aforesaid.

A competent man is to be sent to set up said machinery at the expense of the said Company.

Freight and transportation charges on said machinery from the factory shall be paid by the lessee.

BOND SHOE CO.

By Geo. A. Bond, Prest.

We accept the above proposition, and promise to deliver the lease and machinery as specified therein.

GEM FLEXIBLE INSOLE CO.

Boston, *Oct. 26th*, 1899. By Fred'k G. King.

Terms O. K. E. D. Cox.
Received Oct. 25, 1899. E. D. C.

Lease No. (Form 997–598.)

This Lease and Agreement, made at Boston, Massachusetts, the *27th* day of *November* A. D. 1899, by and between the Gem Flexible Insole Company, a corporation organized and existing under the laws of the State of Maine, having its Treasurer's office in said Boston, hereinafter called the Lessor, party of the first part, and *Bond Shoe Company, Kansas City, Missouri* hereinafter called the Lessee, party of the second part, witnesseth,

Whereas, the Lessor is the owner of, or is licensed under the several Letters Patent of the United States referred to in the schedule following, viz: —

SCHEDULE OF PATENTS.

No. 275,248, dated April 3, 1883.	No. 28,547, dated May 3, 1898.
No. 343,832, dated June 15, 1886.	No. 534,159, dated February 12, 1895.
No. 442,897, dated December 16, 1890.	No. 603,763, dated May 10, 1898.
No. 575,460, dated January 19, 1897.	No. 603,764, dated May 10, 1898.

Other patents pending.

And, whereas, the Lessee desires a license to use the inventions, or some of them, which are patented in and by the Letters Patent referred to in said schedule of patents, and also desires a lease of the machines which are designated by their numbers in the schedule of machines following, viz: —

SCHEDULE OF MACHINES.

One Gem Flexible Insole Machine , No. *166*
One Gem Lip Turner , No. *160*
One Gem Cementer , No. *164*

The said machines being the property of the Lessor.

Now, therefore, the Lessor, in consideration of one dollar and

other valuable consideration to it paid by the Lessee, the receipt of which is hereby acknowledged, and in further consideration of the agreements and conditions hereinafter contained, on the part of the Lessee to be kept and performed, doth lease unto the Lessee the machines designated by their numbers in the foregoing Schedule of Machines, and doth license the Lessee and the operatives in his employment to use the machines hereby leased, and also the inventions patented as aforesaid, or either or any of them, but upon the agreements and conditions hereinafter set forth; and this lease and license is granted by the Lessor and accepted by the Lessee on the express condition that the Lessee shall faithfully keep and perform all the agreements and conditions herein contained on his part to be kept and performed, and upon breach of the same, or either or any of them, by the Lessee, the Lessor, notwithstanding any express or implied waiver of any prior breach, may at its option cancel and terminate this lease and license, and upon written notice thereof by the Lessor to the Lessee or to any one in the possession or apparent control of the machines hereby leased, or either or any of them, this lease and license shall terminate, and possession of the said machines shall thereupon re-vest in the Lessor.

And the Lessee hereby agrees to keep and perform all the following conditions of this lease and license: —

First. The Lessee hereby agrees to use, and is hereby licensed to use, the machines hereby leased and the inventions patented as aforesaid only in his factory in *Kansas City* in the State of *Missouri* and only in the manufacture of insoles or soles for boots and shoes, and agrees to keep the said machinery in working order at his own expense, and to procure of the Lessor or its agents all parts for repairing the machines hereby leased, and agrees not to add to or subtract from the said machines any part or mechanism whatever, now or hereafter organized or connected therewith by the Lessor, nor to make nor allow to be made any change or alteration in the same, nor to remove or deface any dates, numbers, or inscriptions now or hereafter impressed thereon or affixed thereto by the Lessor.

Second. The Lessee hereby agrees to permit the agents and inspectors of the Lessor, at all reasonable times, to have convenient

access to the machines, to examine and inspect the same and the use thereof, and to take an account of the number of revolutions of the main shaft of said insole reinforcing machine as registered by the indicator attached thereto, and to add improvements to the machines as the Lessor may see fit; and to repair or replace any indicator which now is or which may hereafter be attached to any machine hereby leased; and the agreements and conditions herein contained shall apply to all improvements which the Lessor shall hereafter add to the machines, and to all patented inventions hereafter embodied therein, with the same effect as if the patents therefor were included in the foregoing schedule of patents.

Third. The Lessee agrees that he will not manufacture or use in his said factory any insoles or soles embodying the inventions, or either of them. or made in whole or in part by any process patented in any of the Letters Patent under which he is hereby licensed, except and unless the reinforcing material is applied by the aid of an insole reinforcing machine leased to him by the Lessor.

Fourth. The Lessee agrees, on or before the tenth day of each calendar month, while this lease remains in force, to render to the Lessor, on printed forms to be furnished by the Lessor, a statement which shall show the number of revolutions made, during the calendar month next preceding, by the main shaft of said insole reinforcing machine, as registered by the indicator attached thereto, which statement shall be signed by the Lessee or by the operator of said machine; and in case the machines hereby leased have not been used during that month, the Lessee agrees to send one of such printed forms to the Lessor signed by him or his operator, marked across the face with the words "Not in use."

Fifth. The Lessee agrees to pay unto the Lessor, as rent for the machines hereby leased and as royalty for the use of the inventions patented as aforesaid as hereby licensed, the sum of three cents for each and every one thousand revolutions made by the main shaft of the insole reinforcing machine hereby leased, as registered by the indicator attached thereto, the sum accruing for rent and royalties during one calendar month to be due and payable on the last day of the calendar month next following; but the

439

Lessor hereby agrees that **if the amount due on the last day of any month for rent and royalties shall be paid on or before the fifteenth day of that month, it will, in consideration thereof, grant a discount of fifty per cent.**

Sixth. If at any time, or from time to time, the indicator affixed to the said insole reinforcing machine shall from any cause cease to indicate or correctly register the number of revolutions of the main shaft of said machine, or if the glass covering of the indicator shall be removed or be broken or injured, then, and as often as the same shall happen, the Lessee shall immediately certify the fact by a notice in writing delivered to the Lessor at its office in Boston aforesaid.

Seventh. The Lessee hereby agrees that he will not in any way violate or infringe, or contest the validity of, any of the patents under which he is hereby licensed, or the sufficiency of their specifications, or the validity of the title of the Lessor, or of its successors or assigns, to said patents, or either or any of them.

Eighth. This lease and license is not assignable by the Lessee, by his act or by operation of law.

Ninth. The following are also agreed to by the parties to this instrument as conditions of this lease and license:

(a) That the power conveyed by this lease and license is only the right to use the said machines, and not the right to make or sell any machines embodying the patents aforesaid, or any of them, and not the right to use any of the inventions hereby licensed except by the aid of an insole reinforcing machine leased to the Lessee by the Lessor; and that a transfer or removal of the machines hereby leased, or either or any of them, can only be made with the consent of the Lessor, its successors or assigns; and that if the Lessee is or becomes at any time insolvent or bankrupt, or shall make an assignment for the benefit of his creditors, or if a sale, lease, transfer, or removal of said machines, or any of them, shall be made or attempted by the Lessee, or by operation of law, or by any legal officer, representative, or assignee, as the property of the Lessee, without the written consent of the Lessor, or its successors or assigns, this lease and license shall thereupon terminate and expire; and the Lessor, its successors or assigns,

may take possession of said machines without the Lessee having any claim for the repayment of any part of the sum or sums which he may have paid as consideration for the delivery of this lease and license, or for rent and royalty under this instrument.

(b) That in case the Lessee refuses or neglects to perform, or violates, any of the conditions in this lease and license contained, the Lessor, its successors or assigns, notwithstanding any express or implied waiver of any prior breach, shall have the right to terminate this lease and license by giving written notice as aforesaid that it has elected so to do; and upon the giving of such notice this lease and license shall be terminated, and the possession of said machines shall thereupon revest in the Lessor, its successors or assigns, free and discharged of this lease and license; and the Lessor, its successors or assigns, or its authorized agent or agents, may thereupon enter any premises where said machines may be, and may take and remove them, and the Lessee shall have no claim whatever on account of any sum or sums he may have paid for or under this lease or license.

(c) That this lease and license shall continue (provided the Lessee complies with the agreements and conditions herein contained) until the expiration of all and every the Letters Patent referred to in the foregoing Schedule of Patents, or any extensions or renewals of the same, and upon the expiration thereof the Lessee shall deliver to the Lessor, its successors or assigns, the machines hereby leased in good order, natural wear and tear alone excepted.

Tenth. In case any other machines than those hereby leased and licensed, embracing any of the inventions patented in the aforesaid Letters Patent, or any of them, or any inventions or improvements for which Letters Patent shall be granted or assigned to the Lessor, shall hereafter come in possession of the Lessee, by exchange or otherwise, without lease or license from the Lessor, its successors or assigns, then in case the Lessor, its successors or assigns, shall so elect, all the covenants herein contained shall apply to machines, inventions or improvements, and shall govern the parties respectively to the same extent as if the said machines, inventions or improvements had been expressly included

in this lease and license. The Lessor shall give written notice of its election as aforesaid after it shall have received written notice from the Lessee of the possession of such machines, but may give such notice without having received notice from the Lessee of the possession of such machines.

Eleventh. The Lessee agrees that he will not disturb or interfere with, nor permit any one else to disturb or interfere with, any indicator which now is or which may be hereafter placed upon the machines as aforesaid.

Twelfth. All the rights and interests which, under this instrument, and by reason of the ownership of said machines and patents and patent rights, belong to the Lessor, shall be deemed to belong to and may be enforced in the names of the Lessor and its successors and assigns, and all the agreements and conditions binding on the Lessee shall be binding on his legal representatives.

Thirteenth. It is agreed that the numbers of the machines named in this lease may be entered herein by the Lessor after signing; and, in case the Lessee shall require more than one machine, it is agreed that the termination of words relating to the machines shall be construed and considered as written in the singular or plural, as the number of machines entered in the lease and license may require; and also that this instrument may be used in case where the party of the second part shall consist of more than one person, and in that case the termination of the words relating to the said party shall be considered as plural or singular as the sense may require; and that when the party of the second part so consists of several persons, and they sign this lease, either individually or by their firm signature, such signature or signatures shall bind them both jointly and severally hereto.

In witness whereof, the Lessor has caused these presents to be signed in its name, and its corporate seal to be affixed hereto by its Treasurer, and the Lessee has set his hand and seal hereto the day and year first above written.

Executed in Duplicate. GEM FLEXIBLE INSOLE COMPANY,

[SEAL] By Geo. W. Brown, Treasurer.

Lessee will please sign here. ☞ BOND SHOE CO. [SEAL]

PLAINTIFF'S EXHIBIT 51.

[Put in Evidence, page 402.]

Goodyear Department. (1105.)

Lease and License Number

Gem Insole Machinery.

This Lease and Agreement made at Boston in the State of Massachusetts this day of 19 , between the United Shoe Machinery Company, a corporation organized under the laws of the State of New Jersey, having an office in said Boston, hereinafter referred to as the lessor, of the one part, and in the State of hereinafter referred to as the lessee, of the other part:

Witnesseth, that the lessor, in consideration of the covenants and agreements on the part of the lessee herein contained, does hereby lease to and license the lessee under its patents to use the machine or machines of the "Goodyear Department" of the lessor now or hereafter delivered to the lessee, and designated by number or numbers in the following schedule, viz.: —

Gem Flexible Insole Machine No. ,

Gem Lip Turner No. ,

Gem Cementer No. ,

and any duplicate parts, extras, mechanisms and devices relating thereto, or used in connection therewith, now attached to or delivered with the said designated machine or machines, or which may at any time hereafter be obtained from the lessor, or be added thereto with the consent of the lessor (the whole of which machine or machines, duplicate parts, extras, mechanisms and devices, held by the lessee under these presents, whether now or hereafter delivered to or in the possession of the lessee, is hereinafter referred to as the "leased machinery"), subject to the conditions hereinafter contained.

And that the following are agreed to as conditions of the lease and license of the leased machinery, all of which the lessee covenants and agrees to keep and perform: —

One. The leased machinery shall at all times remain and be the sole and exclusive property of the lessor, and the lessee shall have

no right of property therein, but only the right to use the same, upon the conditions herein contained. The leased machinery shall be used only by the lessee himself or by operatives in his direct employ, and only in the factory now occupied by him at in the State of . The leased machinery shall not be transferred or delivered or sublet to any other person or corporation, and neither the lease nor the license hereby granted can be assigned by the lessee by his own act or by operation of law. If the lessee becomes insolvent or bankrupt, or has a receiving order made against him, or makes or executes any bill of sale, deed of trust or assignment for the benefit of his creditors, or if a sale, or lease or removal of the leased machinery, or any part thereof, without the consent in writing of the lessor, be made or attempted, or if any distress or execution or attachment be levied thereon, then and in each such case this lease and license and any other lease or license then existing between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, shall at the option of the lessor cease and determine, and the possession of and full right to and control of all the leased machinery, and any machinery held by the lessee under any other lease or license from the lessor, whether as the result of assignment to the lessor or otherwise, shall thereupon revest in the lessor free from all claims or demands whatsoever. The lessor and its agents and employees shall at all times be given access to the leased machinery for the purpose of inspecting it or watching its use and operation, or of altering, repairing, improving, or adding to it, or determining the nature or extent of its use, and the lessee shall afford all reasonable facilities therefor.

Two. The lessee shall at all times and at his own expense keep the leased machinery in good and efficient working order and condition, and shall not permit anyone to injure or deface or remove any plate, or dates, numbers, or other inscriptions now or hereafter impressed on or affixed to the leased machinery by the lessor. The lessee shall obtain from the lessor exclusively, and shall pay therefor at the regular prices from time to time established by the lessor, all the duplicate parts, extras, mechanisms and devices, of

every kind needed or used in operating, repairing, or renewing the leased machinery, and the same shall form part of the leased machinery, and the lessee shall not otherwise make or allow to be made any addition, subtraction or alteration to, from, or in the leased machinery without the consent in writing of the lessor, nor interfere with the proper operation of the same.

Three. The lessee shall pay all taxes and assessments which shall be levied in respect to the leased machinery, or in respect to this lease and license or the right to payments hereunder, upon whomsoever assessed.

Four. The leased machinery shall be used only in the manufacture or preparation of reinforced insoles which embody the invention patented in Letters Patent of the United States of America, dated January 19, 1897, numbered 575,460, owned by the lessor, for use in boots, shoes and other footwear, which are or shall be welted and the soles stitched either by hand or upon welt sewing and stitching machines leased to the lessee by the lessor or its assignor, and for the use of all of which machines the lessee is continuing to pay the lessor the regular rental or royalty charged by the lessor for each pair of boots, shoes, or other footwear or portions thereof made by the aid of said welt sewing and stitching machines or any part thereof.

Five. The lessee shall pay to the lessor on the last day of each calendar month as rent or royalty, the sum of three cents for each and every one thousand revolutions made during the next preceding calendar month by the main shaft of the Gem Flexible Insole Machine hereby leased, as indicated by the indicator attached thereto by the lessor; **provided, however, that in all cases when the lessee shall pay to the lessor on or before the fifteenth day of the calendar month the rent or royalty due for the use of the leased machinery for the next preceding calendar month, the lessor will in consideration of such prompt payment grant a discount of fifty per cent. from such rent or royalty due for such preceding calendar month.**

Six. The lessor shall attach to the Gem Flexible Insole Machine hereby leased an indicator to register the number of revolu-

tions of the main shaft thereof, and may attach to the leased machinery or any thereof an indicator or indicators to register the number of revolutions or movements of any part or parts thereof, and the lessee shall not allow any person (other than the lessor or its agents) to disturb or interfere with such indicator or indicators. In case any indicator thus attached shall from any cause cease to correctly indicate or register, or shall be disturbed or out of repair, or if the glass covering any such indicator shall be removed or broken or injured, then, and as often as the same shall happen, the lessee shall immediately, by writing, notify the lessor and at the same time explain the circumstances under which the same has happened. In case any such indicator ceases to indicate, or becomes or remains inaccurate, or the glass covering becomes or remains removed, broken or injured because of any fault of the lessee or any one in his employ, or because of the failure of the lessee to give promptly the notice hereinbefore provided for, then without prejudice to any other rights of the lessor hereunder, the lessee shall pay the lessor as rent or royalty, without the right to any discount, one cent per pair for each pair of reinforced insoles in the manufacture or preparation of which the leased machinery or any part thereof shall have been used. The lessee shall keep full and accurate accounts, independently of any indicators that may be placed upon the leased machinery, showing the number of reinforced insoles in the manufacture of which the leased machinery or any part thereof shall have been used, and shall allow the lessor at all times by its agents or attorneys to examine and to take copies of such accounts and entries of the lessee as may serve to determine the total number of reinforced insoles made by the aid of the leased machinery or any part thereof, and the lessee shall produce all such accounts and entries upon request. The lessee shall on or before the fifth day of each calendar month render to the lessor upon blanks or blank books to be furnished by the lessor, a statement which shall show the number of revolutions made during the calendar month next preceding by the main shaft of the Gem Flexible Insole Machine hereby leased, as indicated or registered by the indicator attached thereto, which statement shall be signed

by the lessee or by the operator or operators of said machine, and if requested by the lessor, such statement shall be verified by the lessee under oath. The lessee shall also furnish any further information required by the lessor in reference to the use of the leased machinery, and in case in any calendar month none of the leased machinery has been used, the lessee shall notify the lessor in writing of that fact on or before the fifth day of the next succeeding calendar month.

And that the following agreements, stipulations and provisions are agreed to: —

Seven. This lease and license shall continue, unless sooner terminated by the lessor because of breach thereof on the part of the lessee, or otherwise as herein provided, for seventeen years from the date hereof. But if any breach or default shall be made in the observance of any one or more of the conditions herein contained or contained in any other lease or license agreement subsisting between the lessor and the lessee whether as the result of assignment to the lessor or otherwise and expressed to be obligatory upon the lessee, the lessor shall have the right by notice in writing to the lessee to terminate forthwith this lease and license, and also if the lessor so elects any other lease or license agreements then in force between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, and this notwithstanding that previous breaches or defaults may have been unnoticed, waived or condoned by or on behalf of the lessor. If, upon the expiration of the full term of this lease, the lessor does not request the return of the leased machinery, then the leased machinery shall continue to be held and used under and in accordance with the conditions of this lease and license, which shall thereupon be extended indefinitely as to term; but thereafter either the lessee or the lessor, upon sixty days' notice in writing to the other, may terminate this lease and license, whereupon the leased machinery shall be delivered forthwith to the lessor, as herein provided. Upon the expiration or termination of this lease and license or any extension thereof by notice or by reason of any default on the part of the lessee as to the terms of this lease and license or any other

lease or license from the lessor, or otherwise as herein provided, the lessee shall forthwith deliver the leased machinery to the lessor at its office or factory, in good order, reasonable wear and tear alone excepted; and the lessee for himself, his heirs, executors and administrators, hereby grants to the lessor, its successors and assigns, full right, power and authority to enter upon the premises and into any factory, room, or any place where the leased machinery, or any part thereof, may be, and take possession thereof, and take away the same; and the lessee shall have no claim for the repayment of any sum or sums, or any part thereof, which he shall have paid as consideration for the grant of this lease and license or for rent or royalty, or otherwise in respect to the leased machinery.

Eight. A notice in writing, signed by the president, a vice-president or the treasurer of the lessor or by any assignee of the lessor's rights hereunder and posted by pre-paid letter, addressed to the lessee or delivered at his usual or last known place of abode or business, that the lease and license hereby granted is determined or shall be determined at the expiration of a certain period, shall be a sufficient determination of the lease and license from the time of posting or delivering such notice, or from the expiration of the period therein mentioned, as the case may be. Any termination of this lease and license shall not release the lessee from his obligation to pay rent or royalty for the period prior to such termination, and shall be without prejudice to any other rights or remedies which the lessor may have for violation of contract, use of machines without right, or use of patented inventions without license.

Nine. The lessee admits the validity of each and every of the Letters Patent of the United States of America owned by the lessor or under which it is licensed, any of the inventions of which are or hereafter may be embodied in the leased machinery. The lessee also agrees that he will not directly or indirectly infringe or contest the validity of, or the title of the lessor to, any of the patents referred to in the "Schedule of Patents" hereto annexed. The termination or cesser of this lease and license from any cause whatever shall not in any way affect the provisions of this clause, or

release or discharge the lessee from the admission and estoppel herein set forth.

Ten. None of the terms or conditions of this lease and license shall be held to have been waived by any act or knowledge of the lessor, its agents or employees, but only by an instrument in writing, signed by the president, a vice-president or the treasurer of the lessor.

Eleven. The term "lessor" shall include the said United Shoe Machinery Company and its successors and assigns. All the conditions and agreements binding on the lessee shall be binding on and enforceable against his legal representatives. In the construction of this instrument, words relating to the number and gender of the parties shall be read according to their real number and gender.

In witness whereof, the parties hereto have duly executed this instrument in duplicate, the day and year first above written.

☞ If lessee is a corporation, add corporate seal.

Lease and License Agreement Number .

Economy Insole Reinforcing Set.

This Agreement made at Boston, in the State of Massachusetts, this day of 19 , between the United Shoe Machinery Company, a corporation organized under the laws of the State of New Jersey, having an office in said Boston, hereinafter referred to as the lessor, of the one part, and of in the State of , hereinafter referred to as the lessee, of the other part:

Witnesseth, that the lessor, in consideration of the covenants and agreements on the part of the lessee herein contained, does hereby lease to and license the lessee under any letters patent belonging to the lessor or under which the lessor has the right to grant such license affecting any inventions which are now or hereafter shall be embodied therein or employed in the operation thereof, to use, subject to the conditions, stipulations and provisions hereinafter contained, the machine or machines designated by number or numbers in the following schedule, viz.: —

SCHEDULE OF MACHINES.

Class A.	
Economy Insole Reinforcing Machine, No. . .	$150
Class B.	
Economy Insole Channeling Machine, No. . .	200
Economy Insole Stitching Machine, No. . .	30
Rapid Rotary Cementing Machine, Model J, No. .	75

and any duplicate parts, extras, mechanisms and devices relating thereto, or used in connection therewith, now attached to or delivered with the said designated machine or machines or which may at any time hereafter be obtained from the lessor, or be added thereto by or with the consent of the lessor.

The term the "principal machinery hereby leased" wherever used herein shall be construed to include the whole of the machine or machines hereby leased included in Class A in the foregoing sche-

dule, together with all duplicate parts, extras, mechanisms and devices relating thereto held by the lessee under these presents, whether now or hereafter delivered to or in the possession of the lessee.

The term the "auxiliary machinery hereby leased" wherever used herein shall be construed to include the whole of the machine or machines hereby leased included in Class B in the foregoing schedule, together with all duplicate parts, extras, mechanisms and devices relating thereto held by the lessee under these presents, whether now or hereafter delivered to or in the possession of the lessee.

The term the "leased machinery" wherever used herein shall be construed to include both the "principal machinery hereby leased" and the "auxiliary machinery hereby leased."

And that the following are agreed to as conditions of this agreement, all of which the lessee covenants and agrees to keep and perform: —

One. The leased machinery shall at all times remain and be the sole and exclusive property of the lessor, and the lessee shall have no right of property therein, but only the right to use the same, upon the conditions herein contained. The leased machinery shall be used only by the lessee himself or by operatives in his direct employ, and only in the factory now occupied by him at in the State of unless the lessor shall by an instrument in writing signed by its president, vice-president or treasurer authorize the lessee to remove the leased machinery and to use the same elsewhere. The leased machinery shall not be transferred or delivered or sublet to any other person or corporation, and neither this agreement nor the lease nor the license hereby granted can be assigned by the lessee by his own act or by operation of law. If the lessee becomes insolvent or bankrupt, or has a receiving order made against him, or makes or executes any bill of sale, deed of trust or assignment for the benefit of his creditors, or if a sale, mortgage, lease or unauthorized removal of the leased machinery, or any part thereof, be made or attempted, or if any distress or execution or attachment be levied thereon, then and in each such case any or all

leases of or licenses to use machinery then existing between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, shall at the option of the lessor cease and determine, and the possession of and full right to and control of all machinery the leases or licenses of which are so terminated, shall thereupon revest in the lessor free from all claims or demands whatsoever. The lessor and its agents and employees shall at all times be given access to the leased machinery for the purpose of inspecting it or watching its use and operation, or of altering, repairing, improving, or adding to it, or determining the nature or extent of its use, and the lessee shall afford all reasonable facilities therefor.

Two. The lessee shall at all times and at his own expense keep the leased machinery in good and efficient working order and condition, and shall not permit any one to injure or deface or remove any plate, or dates, numbers, or other inscriptions now or hereafter impressed on or affixed to the leased machinery by the lessor. The lessee shall obtain from the lessor exclusively and shall pay therefor at the regular prices from time to time established by the lessor, all the duplicate parts, extras, mechanisms and devices, of every kind needed or used in operating, repairing, or renewing the leased machinery, and the same shall form part of the leased machinery, and the lessee shall not otherwise make or allow to be made any addition, subtraction or alteration to, from, or in the leased machinery, without the consent in writing of the lessor, nor interfere with the proper operation of the same.

Three. The leased machinery shall at all times, until the expiration or termination of the lease thereof and license to use the same hereby granted and the re-delivery of the leased machinery into the possession of the lessor as hereinafter provided, be held at the sole risk of the lessee from injury, loss or destruction, and, in case any machine or machines hereby leased shall be destroyed by fire or otherwise before such expiration or termination and re-delivery, the lessee shall pay to the lessor in respect to each machine so destroyed the sum set opposite the name of such machine in the Schedule of Machines hereinbefore contained as partial reimbursement to the lessor for such destruction, and the lessee shall forth-

with return whatever remains of the machinery so destroyed to the lessor at Beverly, Massachusetts.

Four. The lessee shall pay all taxes and assessments which shall be assessed in respect to the leased machinery or other machinery of the lessor held by the lessee under lease or license upon whomsoever assessed. All taxes or assessments in respect to leases, licenses or agreements covering machinery, or the rights to payments thereunder, shall be construed, for the purposes of this article, to be assessed in respect to the machinery itself. In case at any time any unapportioned tax or assessment shall be assessed to the lessor in respect in part but not wholly to machinery of the lessor in the possession of the lessee the lessee shall pay to the lessor such proportionate part of the total amount of said unapportioned tax or assessment as the fair valuation, to be determined by the lessor, of said machinery of the lessor in the possession of the lessee bears to the fair valuation, to be determined by the lessor, of all machinery (excepting machinery, if any, in the lessor's own possession) in respect to which the unapportioned tax or assessment has been assessed; provided, however, that if such unapportioned tax or assessment includes any tax or assessment in respect to tangible property in the lessor's own possession the amount thereof, based, at the established rate, upon the fair valuation, to be determined by the lessor, of such property, shall first be deducted and the lessee shall pay his proportionate part as aforesaid of the balance only of said unapportioned tax or assessment after such deduction has been made.

Five. The leased machinery shall be used only in the manufacture or preparation of reinforced insoles which embody the inventions patented in Letters Patent of the United States of America numbered 849,245, dated April 2, 1907, owned by the lessor, for use in welted boots, shoes and other footwear known in the trade as "Goodyear Welts," which have been or are to be welted wholly by Goodyear Welt and Turn Machines or Goodyear Universal Inseam Sewing Machines held by the lessee under lease from the lessor, and the soles of which have been or are to be attached to their welts wholly by Goodyear Outsole Rapid Lockstitch Machines held by

the lessee under lease from the lessor, or for use as insoles or soles of turned boots, shoes and other footwear known in the trade as "Goodyear Turns" the soles of which have been or are to be attached to their uppers by Goodyear Welt and Turn Shoe Machines or Goodyear Universal Inseam Sewing Machines held by the lessee under lease from the lessor, and in the manufacture or preparation of such patented insoles (or soles) the lessee shall use the principal machinery hereby leased to its full capacity so far as the lessee uses reinforced insoles (or soles) in the manufacture of such footwear. The auxiliary machinery hereby leased shall be used only in the manufacture or preparation of said patented insoles (or soles) which have been or are to be reinforced wholly by an Economy Insole Reinforcing Machine hereby leased or held by the lessee under other lease and license from the lessor.

Six. The lessee is hereby licensed under said Letters Patent of the United States numbered 849,245, dated April 2, 1907, to manufacture by the use of the principal machinery hereby leased during the continuance in force of this lease and license the patented insoles covered by said Letters Patent and to use such patented insoles so made by the lessee in the manufacture of welted or turned boots, shoes or other footwear which have been or are to be manufactured as provided in Article Five hereof.

Seven. The lessee shall pay to the lessor on the last day of each calendar month as rent or royalty the sum of three (3) cents for each and every one thousand (1000) revolutions made during the next preceding calendar month by the main shaft of the Economy Insole Reinforcing Machine hereby leased as indicated by the indicator attached thereto by the lessor: **provided, however, that in all cases when the lessee shall pay to the lessor on or before the fifteenth day of the calendar month said rental or royalty in accordance with this Article hereof for the next preceding calendar month, the lessor will, in consideration of such prompt payment, grant a discount of fifty per cent. from the amount so due for such preceding calendar month.** The lessee, however, guarantees that the payments made by him in accordance with the terms of this Article hereof shall amount, in each calendar year ending

December 31st (after deducting all abatements), to at least Fifteen Dollars ($15) for each calendar month for each Economy Insole Reinforing Machine hereby leased, and at the end of each calendar year the lessee shall pay to the lessor the amount, if any, by which the total of such payments for said year have been less than such guaranteed amount: provided, however, that if in any calendar year the factory of the lessee remains wholly idle for any entire calendar month, then the amount guaranteed for that year hereunder shall be reduced by one-twelfth for each such month that the factory has thus remained wholly idle, but such reduction shall not be made in respect to more than ten (10) months out of any twelve (12) consecutive calendar months.

Eight. The lessor shall attach to each Economy Insole Reinforcing Machine hereby leased an indicator or indicators to register the number of revolutions of the main shaft thereof and may attach to the leased machinery or any thereof an indicator or indicators to register the number of revolutions or movements of any part or parts thereof, and the lessee shall not allow any person (other than the lessor or its agents) to disturb or interfere with such indicator or indicators. In case any indicator thus attached shall from any cause cease to correctly indicate or register, or shall be disturbed or out of repair, or if the glass covering any such indicator shall be removed or broken or injured, then and as often as the same shall happen the lessee shall immediately by writing notify the lessor and at the same time explain the circumstances under which the same has happened. In case any such indicator ceases to indicate, or becomes or remains inaccurate, or the glass covering becomes or remains removed, broken, or injured, because of any fault of the lessee or any one in his employ, or because of the failure of the lessee to give promptly the notice hereinbefore provided for, then without prejudice to any other rights of the lessor, the lessee shall pay the lessor (without the right to any discount) the sum of one cent per pair for each pair of reinforced insoles (or soles) in the manufacture or preparation of which the leased machinery or any part thereof shall have been used. The lessee shall keep full and accurate accounts, independently of any indicators that may be

placed upon the leased machinery, showing the number of reinforced insoles (or soles) in the manufacture or preparation of which the leased machinery, or any part thereof, has been used, and shall allow the lessor at all times, by its agents or attorneys, to examine and to take copies of such accounts and entries of the lessee as may serve to determine the total number of such reinforced insoles (or soles) and the lessee shall produce all such accounts and entries upon request. The lessee shall, if so requested by the lessor, require each of his operators upon the leased machinery, or any part thereof, to keep upon blanks or blank-books to be furnished by the lessor accurate daily records of the number of reinforced insoles made by the aid of the leased machinery or any part thereof, and shall require his operators to sign such records, and if requested so to do by the lessor, shall verify the same under oath. The lessee shall send to the office of the lessor in Boston, on or before the fifth day of each calendar month, a statement made upon blanks or blank-books furnished by the lessor which shall show the number of revolutions made during the next preceding calendar month by the main shaft of each Economy Insole Reinforcing Machine hereby leased as registered by the indicator attached thereto. Each such statement shall be signed by the lessee, and, if so requested by the lessor, the lessee shall verify said statements under oath. In case, in any calendar month, the principal machinery (and, if the lessor shall request record of the use of the auxiliary machinery, in case any of the auxiliary machinery) hereby leased has been entirely idle, the lessee, on or before the fifth day of the next succeeding calendar month, shall send to the office of the lessor in Boston the blank for such machine or machines for said month marked "not in use" and signed by the lessee. The lessee shall also furnish any further information which may be called for in relation to the leased machinery or the use thereof.

And that the following stipulations and provisions are agreed to:—

Nine. If at any time the lessee shall fail or cease to use exclusively insole reinforcing machinery held by him under lease from the lessor for reinforcing all reinforced insoles (or soles) made by

or for him, the lessor, although it may have waived or ignored prior instances of such failure or cessation, may at its option terminate forthwith by notice in writing any or all leases or licenses of insole reinforcing or auxiliary machinery, then existing between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise; and the possession of and full right to and control of all machinery the lease or license of which is so terminated shall thereupon revest in the lessor free from all claims and demands whatsoever.

Ten. The term of this agreement shall be seventeen years from the date hereof. The lease of the leased machinery and license to use the same hereby granted shall continue, unless sooner terminated by the lessor because of breach thereof on the part of the lessee, or otherwise as herein provided, for the full term of this agreement. But if any breach or default shall be made in the observance of any one or more of the conditions in this agreement contained or contained in any other lease or license agreement subsisting between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise and expressed to be obligatory upon the lessee, the lessor shall have the right by notice in writing to the lessee to terminate forthwith any or all leases of or licenses to use machinery then in force between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, and this notwithstanding that previous breaches or defaults may have been unnoticed, waived, or condoned by or on behalf of the lessor. If, upon the expiration of the full term of this agreement, the lessor does not request the return of the leased machinery, then the leased machinery shall continue to be held and used under and in accordance with the conditions, stipulations and provisions in this agreement contained and this agreement and the lease and license herein contained shall thereupon be extended indefinitely as to term; but thereafter either the lessee or the lessor, upon sixty days' notice in writing to the other, may terminate this agreement and the lease and license herein contained, whereupon the leased machinery shall be delivered forthwith to the lessor, as herein provided. Upon the expiration or termination of the lease

hereby granted or any extension thereof by notice or by reason of any default on the part of the lessee as to the terms of this agreement or of any other lease or license agreement from the lessor or otherwise, in any manner whatsoever, the lessee shall forthwith at his own expense deliver the leased machinery to the lessor at Beverly, Massachusetts, complete and in good order, reasonable wear and tear alone excepted; and shall thereupon pay to the lessor such sum as may be necessary to put the leased machinery in suitable order and condition to lease to another lessee, including the cost of all parts replaced at the regular prices established by the lessor therefor; and the lessee for himself, his heirs, executors and administrators, hereby grants to the lessor, its successors and assigns, full right, power and authority to enter upon the premises and into any factory, room, or any place where the leased machinery, or any part thereof, may be, and take possession thereof, and take away the same.

Eleven. Upon the expiration or termination of this agreement or any extension thereof or of the lease and license hereby granted the lessee, in addition to all other payments in this lease and license agreement provided for and without prejudice to any other rights or remedies of the lessor, shall pay to the lessor as partial reimbursement to the lessor for deterioration of the leased machinery, expenses in connection with the installation thereof and instruction of operators, an amount in respect to each machine hereby leased equal to two-thirds of the sum set opposite the name of such machine in the Schedule of Machines hereinbefore contained.

Twelve. In case the lessee, at any time, shall have in his factory more machines adapted for doing the same work as any one or more of the auxiliary machines hereby leased than in the opinion of the lessor are sufficient for performing the work which the lessee has in his factory, based upon the capacity of such machines and the amount of such work done by the lessee for any period of twelve (12) consecutive months next preceding, the lessor may, at its option, upon thirty (30) days' notice in writing to the lessee, terminate the lease and license herein contained in respect to such of the said auxiliary machines hereby leased as in the opinion of

the lessor are unnecessary. The termination under the provisions of this Article of the lease of or license to use any one or more of the machines hereby leased shall not affect the lease or license herein contained in respect to any other machine or machines.

Thirteen. In case at any time any of the leased machinery shall not, in the opinion of the lessor, be in good and efficient working order and condition, the lessor without prejudice to any other of its rights or remedies may give written notice to the lessee to put such machinery in good and efficient working order and condition and to replace all broken or missing parts; and in case the lessee does not within fifteen (15) days from the date of such notice comply with the requirements thereof, as herein set forth, the lessor may if it so elects cause such machinery to be put in such good and efficient working order and condition, and may supply such broken or missing parts, and the lessee shall forthwith pay to the lessor the expense of making such repairs and the cost at the regular prices established by the lessor therefor of all parts so supplied.

Fourteen. A notice in writing, signed by the president, a vice-president, the treasurer or an assistant treasurer of the lessor or by any assignee of the lessor's rights hereunder, and posted by prepaid letter, addressed to the lessee or delivered at his usual or last known place of abode or business, that the lease and license hereby granted is terminated or shall be terminated at the expiration of a certain period, shall be a sufficient termination of the lease and license from the time of posting or delivering such notice, or from the expiration of the period therein mentioned, as the case may be. Any termination of this agreement or of the lease and license hereby granted shall not release the lessee from his obligation to pay rent or royalty for the period prior to such termination and shall be without prejudice to any other rights or remedies which the lessor may have for violation of contract, use of machines without right or use of patented inventions without license.

Fifteen. The lessee admits the validity for the full term expressed in the grant thereof (and every extension and renewal thereof) of each and every of the Letters Patent of the United States of America, owned by the lessor or under which it is licensed, any of the

inventions of which are or hereafter may be embodied in the leased machinery or used in the operation thereof or embodied in the reinforced insoles made by the aid of the leased machinery. The lessee also agrees that he will not directly or indirectly infringe or contest the title of the lessor to or the validity for the full term expressed in the grant thereof or of any extension or renewal thereof, of any of said Letters Patent or any of the Letters Patent referred to in the Schedule of Patents hereto annexed. The expiration of this agreement or any extension thereof or the termination or cesser of the lease and license hereby granted shall not in any way affect the provisions of this clause, or release or discharge the lessee from the admissions and estoppels herein set forth.

Sixteen. None of the conditions, stipulations or provisions of this agreement shall be held to have been waived by any act or knowledge of the lessor, its agents or employees, but only by an instrument in writing, signed by the president, a vice-president or the treasurer of the lessor.

Seventeen. The term "lessor" shall include the said United Shoe Machinery Company and its successors and assigns. All the conditions, stipulations and provisions binding on the lessee shall be binding on and enforceable against his legal representatives. In the construction of this instrument, words relating to the number and gender of the parties shall be read according to their real number and gender.

In witness whereof, the parties hereto have duly executed this instrument in duplicate, the day and year first above written.

PLAINTIFF'S EXHIBIT 53.

[Put in Evidence, page 404.]

O. A. Miller Treeing Machine Company. [Form 1001.]
Lease and License Number .

This Lease and Agreement made at Boston in the State of Massachusetts this day of 19 , between the O. A. Miller Treeing Machine Company, a corporation organized under the laws of the State of Maine, having an office in said Boston, hereinafter referred to as the lessor, of the one part, and of in the State of , hereinafter referred to as the lessee, of the other part:

Witnesseth, that the lessor, in consideration of the covenants and agreements on the part of the lessee herein contained, does hereby lease to and license the lessee under any letters patent belonging to the lessor or under which the lessor has the right to grant such license affecting any inventions which are now or hereafter shall be embodied therein or employed in the operation thereof, to use

Victor Power Ironing Machine No.

and any tree legs, tree feet, tree backs, irons, duplicates, parts, extras, mechanisms and devices relating thereto, or used in con-

nection therewith, now attached to or delivered with the said designated machine, or which may at any time hereafter be obtained from the lessor, or be added thereto by or with the consent of the lessor (which machine, together with all tree legs, tree feet, tree backs, irons, duplicates, parts, extras, mechanisms and devices, held by the lessee under these presents, whether now or hereafter delivered to or in the possession of the lessee, is hereinafter referred to as the "leased machinery"), subject to the conditions hereinafter contained.

And that the following are agreed to as conditions of the lease and license of the leased machinery, all of which the lessee covenants and agrees to keep and perform: —

One. The leased machinery shall at all times remain and be the sole and exclusive property of the lessor, and the lessee shall have no right of property therein, but only the right to use the same, upon the conditions herein contained. The leased machinery shall be used only by the lessee himself or by operatives in his direct employ, and only in the factory now occupied by him at in the State of . The leased machinery shall not be transferred or delivered or sublet to any other person or corporation, and neither the lease nor the license hereby granted can be assigned by the lessee by his own act or by operation of law. If the lessee becomes insolvent or bankrupt, or has a receiving order made against him, or makes or executes any bill of sale, deed of trust or assignment for the benefit of his creditors, or if a sale, mortgage, lease or removal of the leased machinery or any part thereof, be made or attempted, or if any distress or execution or attachment be levied thereon, then and in each such case any or all leases of or licenses to use machinery then existing between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, shall at the option of the lessor cease and determine, and the possession of and full right to and control of all machinery the leases or licenses of which are so terminated, shall thereupon revest in the lessor free from all claims or demands whatsoever. The lessor and its agents and employees shall at all times be given access to the leased machinery for the purpose of inspecting it or

watching its use and operation, or of altering, repairing, improving, or adding to it, or determining the nature or extent of its use, and the lessee shall afford all reasonable facilities therefor.

Two. The lessee shall at all times and at his own expense keep the leased machinery in good and efficient working order and condition, and shall not permit any one to injure or deface or remove any plate, or dates, numbers, or other inscriptions, now or hereafter impressed on or affixed to the leased machinery by the lessor. The lessee shall obtain from the lessor exclusively, and shall pay therefor at the regular prices from time to time established by the lessor, all the tree legs, tree feet, tree backs, irons, duplicates, parts, extras, mechanisms and devices, of every kind needed or used in operating, repairing, or renewing the leased machinery, and the same shall form part of the leased machinery, and the lessee shall not otherwise make or allow to be made any addition, subtraction or alteration to, from, or in the leased machinery without the consent in writing of the lessor, nor interfere with the proper operation of the same.

Three. The lessee shall pay all taxes and assessments which shall be assessed in respect to the leased machinery or other machinery of the lessor held by the lessee under lease or license upon whomsoever assessed. All taxes or assessments in respect to leases, licenses or agreements covering machinery, or the rights to payments thereunder, shall be construed, for the purposes of this article, to be assessed in respect to the machinery itself. In case at any time any unapportioned tax or assessment shall be assessed to the lessor in respect in part but not wholly to machinery of the lessor in the possession of the lessee the lessee shall pay to the lessor such proportionate part of the total amount of said unapportioned tax or assessment as the fair valuation, to be determined by the lessor, of said machinery of the lessor in the possession of the lessee bears to the fair valuation, to be determined by the lessor, of all machinery (excepting machinery, if any, in the lessor's own possession) in respect to which the unapportioned tax or assessment has been assessed; provided, however, that if such unapportioned tax or assessment includes any tax or assessment in respect to tan-

gible property in the lessor's own possession the amount thereof, based, at the established rate, upon the fair valuation, to be determined by the lessor, of such property, shall first be deducted and the lessee shall pay his proportionate part as aforesaid of the balance only of said unapportioned tax or assessment after such deduction has been made.

Four. The lessee shall use the leased machinery to its full capacity, limited only by the number of boots, shoes, and other footwear made by or for him.

Five. The lessee shall pay to the lessor on the last day of each calendar month as rent or royalty the sum of four and one-fifth (4 1-5) cents for each and every dozen pairs, or fraction thereof, of boots, shoes or other footwear operated upon by the leased machinery or any part thereof during the next preceding calendar month; **provided, however, that in all cases when the lessee shall pay to the lessor on or before the fifteenth day of the calendar month the rent or royalty due for the use of the leased machinery for the next preceding calendar month the lessor will in consideration of such prompt payment, accept the sum of four (4) cents per dozen pairs or fraction thereof, in lieu of said rental or royalty of four and one-fifth (4 1-5) cents per dozen pairs.**

Six. The lessee guarantees that the net amount of rent or royalty paid by him under the provisions of Article Five hereof shall amount to at least fifteen dollars ($15.00) for each calendar month; and on or before the last day of each calendar month the lessee shall pay to the lessor the amount, if any, by which the net amount of rent or royalty paid by him in respect to the use of the leased machinery during the preceding calendar month is less than such guaranteed rent or royalty.

Seven. The lessor may attach to the leased machinery, or any part thereof, an indicator or indicators to register the number of revolutions or movements of any part or parts thereof, and the lessee shall not allow any person (other than the lessor or its agents) to disturb or interfere with such indicator or indicators. In case any indicator thus attached shall from any cause cease to correctly indicate or register, or shall be disturbed or out of repair,

or if the glass covering any such indicator shall be removed or broken or injured, then, and as often as the same shall happen, the lessee shall immediately, by writing, notify the lessor, and at the same time explain the circumstances under which the same has happened. In case any such indicator ceases to indicate, or becomes or remains inaccurate, or the glass covering becomes or remains removed, broken or injured, because of any fault of the lessee or any one in his employ, or because of the failure of the lessee to give promptly the notice hereinbefore provided for, then, without prejudice to any other rights of the lessor hereunder, the lessee shall pay the lessor as rent or royalty, without the right to any discount, the sum of one-half of one cent per pair for each pair of boots, shoes or other footwear, or portions thereof, operated upon by the aid of the leased machinery or any part thereof. The lessee shall keep full and accurate accounts, independently of any indicators that may be placed upon the leased machinery, showing the number of boots, shoes and other footwear, or portions thereof, operated upon by the aid of the leased machinery or any part thereof, and shall allow the lessor at all times, by its agents or attorneys, to examine and to take copies of such accounts and entries of the lessee as may serve to determine the total number of such boots, shoes and other footwear, or portions thereof, and the lessee shall produce all such accounts and entries upon request. The lessee shall require each of his operators upon the leased machinery or any part thereof to keep upon blanks or blank-books, to be furnished by the lessor, accurate daily records of the number of boots, shoes or other footwear, or portions thereof, operated upon by the aid of the leased machinery or any part thereof, and shall require his operators to sign such records, and, if requested so to do by the lessor, shall verify the same under oath. The lessee shall send to the office of the lessor in Brockton, on or before the fifth day of each calendar month, the original records for the next preceding calendar month kept by his operators, as above provided for; and, in case in any calendar month none of the leased machinery has been used, the lessee shall notify the lessor in writing of that fact, on or before the fifth day of the next succeeding

calendar month. The lessee shall also furnish any further information which may be called for in relation to the leased machinery or the use thereof.

And that the following agreements, stipulations and provisions are agreed to: —

Eight. If at any time the lessee shall fail or cease to use exclusively ironing and treeing machinery held by him under lease from the lessor for doing all work in the manufacture or preparation of all boots, shoes or other footwear made by or for him, which is done by the aid of treeing or ironing machinery, the lessor, although it may have waived or ignored prior instances of such failure or cessation, may, at its option, terminate forthwith, by notice in writing, any or all leases of or licenses to use machinery then existing between the lessor and the lessee; and the possession of and full right to and control of all machinery the leases or licenses of which are so terminated shall thereupon revest in the lessor, free from all claims or demands whatsoever.

Nine. This lease and license shall continue, unless sooner terminated by the lessor because of breach thereof on the part of the lessee, or otherwise as herein provided, for seventeen years from the date hereof. But if any breach or default shall be made in the observance of any one or more of the conditions herein contained or contained in any other lease or license agreement subsisting between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise and expressed to be obligatory upon the lessee, the lessor shall have the right by notice in writing to the lessee to terminate forthwith any or all leases of or licenses to use machinery then existing between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, and this notwithstanding that previous breaches or defaults may have been unnoticed, waived, or condoned by or on behalf of the lessor. If, upon the expiration of the full term of this lease, the lessor does not request the return of the leased machinery, then the leased machinery shall continue to be held and used under and in accordance with the conditions of this lease and license, which shall thereupon be extended indefinitely as to term; but thereafter either the

lessee or the lessor, upon sixty days' notice in writing to the other, may terminate this lease and license, whereupon the leased machinery shall be delivered forthwith to the lessor, as herein provided. Upon the expiration of this lease and license or any extension thereof or its termination by notice or by reason of any default on the part of the lessee as to the terms of this lease and license or any other lease or license from the lessor, or otherwise in any manner whatsoever, the lessee shall forthwith deliver the leased machinery to the lessor at Beverly, Massachusetts, in good order, reasonable wear and tear alone excepted; and shall thereupon pay to the lessor such sum as may necessary to put the leased machinery in suitable order and condition to lease to another lessee, and in addition thereto the lessee shall also, without prejudice to any other rights and remedies of the lessor hereunder, pay to the lessor the sum of One Hundred Dollars ($100) as compensation for setting up the leased machinery in his factory, for instructing operators and for deterioration of the leased machinery; and the lessee for himself, his heirs, executors and administrators, hereby grants to the lessor, its successors and assigns, full right, power and authority to enter upon the premises and into any factory, room, or any place where the leased machinery, or any part thereof, may be, and take possession thereof, and take away the same.

Ten. A notice in writing, signed by the president, a vice-president, the treasurer or the assistant treasurer of the lessor or by any assignee of the lessor's rights hereunder, and posted by prepaid letter, addressed to the lessee or delivered at his usual or last known place of abode or business, that the lease and license hereby granted is determined or shall be determined at the expiration of a certain period, shall be a sufficient determination of the lease and license from the time of posting or delivering such notice, or from the expiration of the period therein mentioned, as the case may be. Any termination of this lease and license shall not release the lessee from his obligation to pay rent or royalty for the period prior to such termination and shall be without prejudice to any other rights or remedies which the lessor may have for violation of con-

tract, use of machines without right or use of patented inventions without license.

Eleven. The lessee admits the validity for the full term expressed in the grant thereof (and every extension and renewal thereof) of each and every of the Letters Patent of the United States of America, owned by the lessor or under which it is licensed, any of the inventions of which are or hereafter may be embodied in the leased machinery. The lessee also agrees that he will not directly or indirectly infringe or contest the validity for the full term expressed in the grant thereof or of any extension or renewal thereof, of any of said Letters Patent or the title of the lessor thereto. The expiration of this agreement or any extension thereof or the termination or cesser of the lease and license hereby granted shall not in any way affect the provisions of this clause, or release or discharge the lessee from the admissions and estoppels herein set forth.

Twelve. None of the terms or conditions of this lease and license shall be held to have been waived by any act or knowledge of the lessor, its agents or employees, but only by an instrument in writing, signed by the president, a vice-president or the treasurer of the lessor.

Thirteen. The term "lessor" shall include the said O. A. Miller Treeing Machine Company and its successors and assigns. All the conditions and agreements binding on the lessee shall be binding on and enforceable against his legal representatives. In the construction of this instrument, words relating to the number and gender of the parties shall be read according to their real number and gender.

In witness whereof, the parties hereto have duly executed this instrument in duplicate, the day and year first above written.

PLAINTIFF'S EXHIBIT 54.

[Put in Evidence, page 404.]

Lease and License Number [4001.]
Shoe Repair Outfit.

This Lease and Agreement made at Boston, in the State of Massachusetts, this day of 19 , between the United Shoe Repairing Machine Company, a corporation organized under the laws of the State of Maine, having an office in said Boston, hereinafter referred to as the lessor, of the one part, and of in the State of , hereinafter referred to as the lessee, of the other part:

Witnesseth, that the lessor, in consideration of the covenants and agreements on the part of the lessee herein contained, does hereby lease to and license the lessee under any letters patent belonging to the lessor or under which the lessor has the right to grant such license affecting any inventions which are now or hereafter may be embodied therein or employed in the operation thereof, to use the machine or machines now or hereafter delivered to the lessee and designated by number or numbers in the following schedule, viz.:—

SCHEDULE OF MACHINES.

Machine Bench, No.
Goodyear Outsole Rapid Lockstitch Machine, No.
Extension Edge Attachment (A), No.
Steam Generator, No.
Goodyear Rapid Bobbin Winding Machine, No.
Edge Trimming Machine, No.
Cutter Grinding Machine, No.
Edge Trimming Machine Blower, No.

Buffing Machine, No.
Finishing Machine, No.
Edge Setting Machine, No.
Tap Scarfing Machine, No.
Impression Stitch Machine, No.

and any duplicate parts, extras, mechanisms and devices, relating thereto, or used in connection therewith, now attached to or delivered with the said designated machine or machines, or which may at any time hereafter be obtained from the lessor, or be added thereto by or with the consent of the lessor (the whole of which machine or machines, duplicate parts, extras, mechanisms and devices, held by the lessee under these presents, whether now or hereafter delivered to or in the possession of the lessee, is hereinafter referred to as the "leased machinery"), subject to the conditions hereinafter contained.

And that the following are agreed to as conditions of the lease and license of the leased machinery, all of which the lessee covenants and agrees to keep and perform: —

One. The leased machinery shall at all times remain and be the sole and exclusive property of the lessor, and the lessee shall have no right of property therein, but only the right to use the same, upon the conditions herein contained. The leased machinery shall be used only by the lessee himself, or by operatives in his direct employ, and only on the premises now occupied by him at No. Street in in the State of unless the lessor shall in each instance by an instrument in writing signed by its President, Vice-President or Treasurer authorize the lessee to remove the leased machinery and use the same elsewhere. The leased machinery shall not be transferred or delivered or sublet to any other person or corporation, and neither the lease nor the license hereby granted can be assigned by the lessee by his own act or by operation of law. If the lessee becomes insolvent or bankrupt, or has a receiving order made against him, or makes or executes any bill of sale, deed of trust or assignment for the benefit of his creditors, or if a sale, mortgage, lease or unauthorized removal of the leased machinery, or any part thereof, be made or attempted, or if any distress or

execution or attachment be levied thereon, then and in each such case any or all leases of or licenses to use machinery then existing between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, shall at the option of the lessor cease and determine, and the possession of and full right to and control of all machinery the leases or licenses of which are so terminated shall thereupon revest in the lessor free from all claims or demands whatsoever. The lessor and its agents and employees, shall at all times be given access to the leased machinery for the purpose of inspecting it or watching its use and operation, or of altering, repairing, improving or adding to it, or determining the nature or extent of its use, and the lessee shall afford all reasonable facilities therefor.

Two. The lessee shall at all times and at his own expense keep the leased machinery in good and efficient working order and condition, and shall not permit any one to injure or deface or remove any plate, or dates, numbers, or other inscriptions now or hereafter impressed on or affixed to the leased machinery. The lessee shall obtain from the lessor exclusively, and shall pay therefor at the regular prices from time to time established by the lessor, all the duplicate parts, extras, mechanisms and devices, of every kind needed or used in operating, repairing, or renewing the leased machinery, and the same shall form part of the leased machinery, and the lessee shall not otherwise make or allow to be made any addition, subtraction or alteration to, from, or in the leased machinery, nor interfere with the proper operation of the same.

Three. The lessee shall pay all taxes and assessments which shall be assessed upon or in respect to the leased machinery or other machinery of the lessor held by the lessee under lease or license upon whomsoever assessed. All taxes or assessments in respect to leases, licenses or agreements covering machinery, or the rights to payments thereunder, shall be construed, for the purposes of this article, to be assessed in respect to the machinery itself. In case at any time any unapportioned tax or assessment shall be assessed to the lessor in respect in part, but not wholly to machinery of the lessor in the possession of the lessee the lessee shall

pay to the lessor such proportionate part of the total amount of said unapportioned tax or assessment as the fair valuation, to be determined by the lessor, of said machinery of the lessor in the possession of the lessee bears to the fair valuation, to be determined by the lessor, of all machinery and other tangible property in respect to which the unapportioned tax or assessment has been assessed.

Four. The leased machinery shall be used in repairing footwear only and shall be used for no purpose other than that for which it is designed and hereby leased. It shall not nor shall any part thereof be used in the manufacture of new footwear. It shall not nor shall any part thereof be used in repairing any welted footwear other than the footwear known in the trade as "Goodyear Welts" or "Hand Welts" the welts of which have been attached by Goodyear Welt Sewing Machines or by hand and the outsoles of which have been attached by Goodyear Outsole Stitching Machines or by hand. It shall not nor shall any part thereof be used upon any welted footwear in the repair of which any Outsole Sewing or Stitching Machine other than Goodyear Outsole Rapid Lockstitch Machines held by the lessee under lease from the lessor or its assignor has been or is to be used. Subject to the foregoing limitations all Goodyear Outsole Rapid Lockstitch Machines hereby leased or held by the lessee under other lease from the lessor (whether as the result of assignment to the lessor or otherwise) shall be used by the lessee to their full capacity limited only by the amount of work done by or for the lessee in which the same can be used.

Five. The lessee shall pay to the lessor upon the execution hereof, as a lease premium, the sum of Dollars and the lessee shall also pay to the lessor on the last day of each calendar month the sum of twenty-four (24) cents for each and every one thousand (1000) revolutions made during the next preceding calendar month by the main shaft of each Goodyear Outsole Rapid Lockstitch Machine held by the lessee under any lease or license or other agreement subsisting between the lessor and the lessee (whether as the result of assignment to the lessor or otherwise) which contains a

provision for payment based upon the number of revolutions similar to that herein contained as indicated by the indicator attached thereto by the lessor or its assignor: **provided, however, that in all cases when the lessee shall pay to the lessor on or before the fifteenth day of the calendar month the amount due for the next preceding calendar month, and such amount shall exceed the guaranteed amount hereinafter provided for, the lessor will, in consideration of such prompt payment, grant a discount of fifty per cent. from said amount for such preceding calendar month, except that such discount shall in no case exceed the difference between the amount due for such preceding calendar month and said guaranteed amount.** The lessee, however, guarantees that the total amount paid to the lessor in accordance with the provisions of this paragraph hereof (less all abatements) shall be at least five (5) dollars for each calendar month for each such Goodyear Outsole Rapid Lockstitch Machine, and the lessee shall pay to the lessor on the last day of each calendar month the amount, if any, by which the amount paid for the preceding calendar month is less than said guaranteed amount.

Six. The lessor may attach to the leased machinery or any thereof an indicator or indicators to register the number of revolutions or movements of any part or parts thereof and the lessee shall not allow any person other than the lessor or its agents to disturb or interfere with such indicator or indicators. In case any indicator thus attached shall from any cause cease to correctly indicate or register, or shall be disturbed or out of repair, or if the glass covering any such indicator shall be removed or broken or injured, then and as often as the same shall happen, the lessee shall immediately by writing notify the lessor and at the same time explain the circumstances under which the same has happened, and the lessee shall pay to the lessor the sum of six cents per pair for each pair of footwear operated upon by any Goodyear Outsole Rapid Lockstitch Machine held by the lessee under lease from the lessor (whether as the result of assignment to the lessor or otherwise) during such time as any indicator attached thereto by the lessor or its assignor shall be or remain disturbed or out of repair or the glass covering

the same shall be or remain removed, broken or injured. The lessee shall keep full and accurate accounts, independently of any indicator that may be placed upon the leased machinery, showing the number of pairs of footwear or portions thereof operated upon by each Goodyear Outsole Rapid Lockstitch Machine held by the lessee under lease from the lessor (whether as the result of assignment to the lessor or otherwise), and shall allow the lessor at all times by its agents or attorneys to examine and to take copies of such accounts and entries of the lessee as may serve to determine the total number of pairs of such footwear or portions thereof, and the lessee shall produce all such accounts and entries upon request. The lessee shall, on or before the fifth day of each calendar month, render to the lessor upon blanks or blank books to be furnished by the lessor, a statement which shall show the number of revolutions made during the calendar month next preceding as indicated by the indicator attached to each such Goodyear Outsole Rapid Lockstitch Machine, which statement shall be signed by the lessee or by the operator or operators of said machine, and, if requested by the lessor, such statement shall be verified by the lessee under oath. The lessee shall also whenever requested by the lessor render to the lessor a statement showing the number of pairs of footwear or portions thereof operated upon by any such Goodyear Outsole Rapid Lockstitch Machine during any period which the lessor may request, and shall, if so requested by the lessor, verify such statement under oath. The lessee shall also furnish any further information which may be called for by the lessor with reference to the leased machinery or the use thereof.

And that the following terms, stipulations and provisions are agreed to:—

Seven. In case at any time the lessee shall fail or cease to use exclusively stitching machinery held by him under lease from the lessor or its assignor for doing all work which is of the kind for which he is licensed to use the stitching machinery held by him under lease from the lessor or its assignor and which is done by or for him by the aid of sole stitching machinery, the lessor, although it may have waived or ignored prior instances of such failure or

cessation, may, at its option, terminate forthwith by notice in writing this lease and license and any or all other leases of or licenses to use machinery then existing between the lessor and the lessee (whether as the result of assignment to the lessor or otherwise) and the possession of and full right to and control of all machinery the lease or license of which is so terminated shall thereupon revest in the lessor free from all claims and demands whatsoever.

Eight. In case at any time the leased machines, or any thereof, shall have parts missing or broken or shall not otherwise, in the opinion of the lessor, be in good and efficient working order and condition, the lessor, without prejudice to any other of its rights or remedies, may forthwith put the same in good and efficient working order and condition, and may replace all broken or missing parts, and the lessee shall forthwith pay the lessor the expense of making such repairs and for all parts supplied at the regular prices established by the lessor for such parts.

Nine. This lease and license shall continue, unless sooner terminated by the lessor because of breach thereof on the part of the lessee, or otherwise as herein provided, for seventeen years from the date hereof. But if any breach or default shall be made in the observance of any one or more of the conditions herein contained or contained in any other lease or license now or hereafter existing between the lessee and the lessor (whether as the result of assignment to the lessor or otherwise) and expressed to be obligatory upon the lessee, the lessor shall have the right by notice in writing to the lessee to terminate forthwith any or all leases of or licenses to use machinery then in force between the lessor and the lessee whether as the result of assignment to the lessor or otherwise, and this notwithstanding that previous breaches or defaults may have been unnoticed, waived or condoned by or on behalf of the lessor. If, upon the expiration of the full term of this lease, the lessor does not request the return of the leased machinery, then the leased machinery shall continue to be held and used under and in accordance with the conditions of this lease and license, which shall thereupon be extended indefinitely as to term; but thereafter either the

lessee or the lessor, upon thirty days' notice in writing to the other, may terminate this lease and license, whereupon the leased machinery shall be delivered forthwith to the lessor, as herein provided.

Ten. Independently of and in addition to all other rights and remedies of the lessor hereunder the lessor shall have the right to terminate this lease and license at any time upon thirty days' notice in writing to the lessee.

Eleven. Upon the expiration of this lease and license or any extension thereof or its termination by notice or by reason of any default on the part of the lessee as to the terms of this lease and license or any other lease or license from the lessor or otherwise in any manner whatsoever, the lessee shall forthwith deliver the leased machinery to the lessor at Beverly, Massachusetts, complete and in good order, reasonable wear and tear alone excepted; and the lessee for himself, his heirs, executors and administrators, hereby grants to the lessor, its successors and assigns, full right, power and authority to enter upon the premises and into any factory, room or any place where the leased machinery, or any part thereof, may be, and take possession thereof, and take away the same; and in no case shall the lessee have any claim for the repayment or offset of any sum or sums, or any part thereof, which shall have been paid as consideration for the grant of this lease and license or for rent or royalty, or otherwise in respect to the leased machinery; excepting alone, however, that in case the lease and license hereby granted shall be terminated by the lessor at any time within five years from the date hereof in the exercise by the lessor of the option contained in Article Ten, hereof, without any breach or default whatsoever on the part of the lessee and without any other right of termination having accrued to the lessor, the lessor shall repay to the lessee such proportionate part of the sum paid by the lessee to the lessor as a lease premium upon the grant of this lease and license as the unexpired portion of said period of five years from the date hereof bears to said entire period of five years, less the amount of any indebtedness of the lessee to the lessor under this lease and license agreement or otherwise.

Twelve. A notice in writing, signed by the president, a vice-president, the treasurer or the assistant treasurer of the lessor or by any assignee of the lessor's rights hereunder, and posted by prepaid letter, addressed to the lessee or delivered at his usual or last known place of abode or business, that the lease and license hereby granted is terminated or shall be terminated at the expiration of a certain period, shall be a sufficient termination of the lease and license from the time of posting or delivering such notice, or from the expiration of the period therein mentioned, as the case may be. Any termination of this lease and license shall not release the lessee from his obligation to pay rent or royalty for the period prior to such termination, and shall be without prejudice to any other rights or remedies which the lessor may have for violation of contract, use of machines without right, or use of patented inventions without license.

Thirteen. The lessee admits the validity for the full term expressed in the grant thereof (and every extension and renewal thereof) of each and every of the Letters Patent of the United States of America, owned by the lessor or under which it is licensed, any of the inventions of which are or hereafter may be embodied in the leased machinery. The lessee also agrees that he will not directly or indirectly infringe or contest the validity for the full term expressed in the grant thereof or of any extension or renewal thereof, of any of the Letters Patent referred to in the "Schedule of Patents" hereto annexed or the title of the lessor thereto. The expiration of this agreement or any extension thereof or the termination or cesser of the lease or license hereby granted shall not in any way affect the provisions of this clause, or release or discharge the lessee from the admissions and estoppels herein set forth.

Fourteen. None of the terms or conditions of this lease and license shall be held to have been waived by any act or knowledge of the lessor, its agents or employees, but only by an instrument in writing, signed by the president, a vice-president or the treasurer of the lessor.

Fifteen. The term "lessor" shall include the said United Shoe Repairing Machine Company and its successors and assigns. All

the conditions and agreements binding on the lessee shall be binding on and enforceable against his legal representatives. In the construction of this instrument, words relating to the number and gender of the parties shall be read according to their real number and gender.

In witness whereof, the parties hereto have duly executed this instrument in duplicate, the day and year first above written.

[Put in Evidence, page 405.]

Lease and License Agreement Number . [Form 1003.]

This Agreement made this day of 19 , between the O. A. Miller Treeing Machine Company, a corporation organized under the laws of the State of Maine, hereinafter referred to as the lessor, of the one part, and of in the State of , hereinafter referred to as the lessee, of the other part:

Witnesseth, that the lessor, in consideration of the covenants and agreements on the part of the lessee herein contained, does hereby lease to and during the continuance of such lease does license the lessee under any letters patent belonging to the lessor or under which the lessor has the right to grant such license affecting any inventions which are now or hereafter shall be embodied therein or employed in the operation thereof, to use

Miller Shoe Breaking-In and Forming Machine(s) No(s). now or hereafter delivered to the lessee and all tools, duplicate parts, extras, mechanisms and devices relating thereto, or used in connection therewith, now attached to or delivered with the said designated machine or machines or which may at any time hereafter be obtained from the lessor, or be added thereto by or with the consent of the lessor (the whole of which machine or machines, tools, duplicate parts, extras, mechanisms and devices, held by the lessee under these presents, whether now or hereafter delivered to or in the possession of the lessee, is hereinafter referred to as the "leased machinery"), subject to the conditions hereinafter contained.

And that the following are agreed to as conditions of this agreement, all of which the lessee covenants and agrees to keep and perform: —

One. The leased machinery shall at all times remain and be the sole and exclusive property of the lessor, and the lessee shall have no right of property therein, but only the right to use the same, upon the conditions herein contained. The leased machinery shall be used only by the lessee himself, or by operatives in his direct

employ. The leased machinery shall be used only the premises now occupied by the lessee at No. Street in in the State of , unless the lessor shall by an instrument in writing, signed by its president, vice-president or treasurer, authorize the lessee to remove the leased machinery, and to use the same elsewhere. The leased machinery shall not be transferred or delivered or sublet to any other person or corporation, and neither this agreement nor the lease nor the license hereby granted can be assigned by the lessee by his own act or by operation of law. If the lessee becomes insolvent or bankrupt, or has a receiving order made against him, or makes or executes any bill of sale, deed of trust or assignment for the benefit of his creditors, or if a sale, mortgage, lease or unauthorized removal of the leased machinery, or any part thereof be made or attempted, or if any distress or execution or attachment be levied thereon, then and in each such case any or all leases of or licenses to use machinery then existing between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, shall at the option of the lessor cease and determine, and the possession of and full right to and control of all machinery the leases or licenses of which are so terminated, shall thereupon revest in the lessor free from all claims and demands whatsoever. The lessor and its agents and employees shall at all times be given access to the leased machinery for the purpose of inspecting it or watching its use and operation, or of altering, repairing, improving, or adding to it, or determining the nature or extent of its use, and the lessee shall afford all reasonable facilities therefor.

Two. The lessee shall at all times and at his own expense keep the leased machinery in good and efficient working order and condition, and shall not permit any one to injure or deface or remove any plate, or dates, numbers, or other inscriptions now or hereafter impressed on or affixed to the leased machinery by the lessor. The lessee shall obtain from the lessor exclusively, and shall pay therefor at the regular prices from time to time established by the lessor, all the special tools, duplicate parts, extras, mechanisms and devices of every kind needed or used in operating, repairing, or renewing

the leased machinery, and the same shall form part of the leased machinery, and the lessee shall not otherwise make or allow to be made any addition, subtraction, or alteration to, from, or in the leased machinery nor interfere with the proper operation of the same.

Three. The leased machinery shall at all times, until the expiration or termination of the lease thereof and license to use the same hereby granted and the re-delivery of the leased machinery into the possession of the lessor as hereinafter provided, be held at the sole risk of the lessee from injury, loss or destruction, and in case any machine or machines hereby leased shall be destroyed by fire or otherwise before such expiration or termination and re-delivery, the lessee shall pay to the lessor upon demand the sum of One Hundred and Fifty Dollars ($150) in respect to each machine so destroyed as partial reimbursement to the lessor for such destruction, and the lessee shall forthwith return whatever remains of the leased machinery so destroyed to the lessor at Brockton, Massachusetts.

Four. The lessee shall pay all taxes and assessments which shall be assessed in respect to the leased machinery or other machinery of the lessor in the possession of the lessee upon whomsoever assessed. All taxes or assessments in respect to leases, licenses or agreements covering machinery, or the rights to payments thereunder, shall be construed, for the purposes of this article, to be assessed in respect to the machinery itself.

Five. The lessee shall pay to the lessor immediately upon the execution hereof as an installation fee the sum of Twenty-five Dollars ($25) in respect to each machine hereby leased. The lessee shall also pay to the lessor annually, in advance, a rental or royalty of Twenty-five Dollars ($25) per year in respect to each machine hereby leased, the first such payment to be made forthwith in addition to the installation fee and subsequent payments to be made on the anniversary of the date of this agreement in each year.

Six. The lease hereby granted shall continue, unless sooner terminated by the lessor because of breach thereof on the part of the lessee or otherwise as herein provided, for a period of one (1) year from the date hereof, and unless terminated by either party by

written notice to the other upon the expiration of said period of one year shall continue thereafter from year to year until such time as either party shall have given to the other, at least thirty days prior to the expiration of any lease year, notice in writing to terminate the same upon the expiration of such lease year. In case, however, at any time any breach or default shall be made in the observance of any one or more of the conditions in this agreement contained or contained in any other lease and license agreement between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, and expressed to be obligatory upon the lessee, the lessor shall have the right, by notice in writing to the lessee, to terminate forthwith any or all leases of or licenses to use machinery then in force between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, and this notwithstanding that previous breaches or defaults have been unnoticed, waived, or condoned by the lessor. Upon the expiration or termination of the lease hereby granted or any extension thereof by notice or by reason of any default on the part of the lessee or otherwise in any manner whatsoever, the lessee shall forthwith, at his own expense, deliver the leased machinery to the lessor at Brockton, Massachusetts, complete and in good order, reasonable wear and tear alone excepted, and shall thereupon pay to the lessor such sum as may be necessary to put the leased machinery in good and efficient working order and condition, including payment at the regular rates established by the lessor therefor for any broken or missing parts, tools or mechanisms, and in no case shall the lessee be entitled to the return or offset of any sum or any part thereof which he shall have paid as consideration for the grant of this lease and license or for rent or royalty or otherwise in respect to the leased machinery. The lessee, for himself, his heirs, executors, administrators, successors and assigns, hereby grants to the lessor and its agents full right, power, and authority upon such expiration or termination to enter upon the premises and into any factory, room, or any place where the leased machinery or any part thereof may be, and to take possession thereof and take away the same.

Seven. A notice in writing, signed by the president, a vice-president, the treasurer or an assistant treasurer of the lessor or by any assignee of the lessor's rights hereunder, and posted by prepaid letter, addressed to the lessee or delivered at his usual or last known place of abode or business, that the lease and license hereby granted is terminated or shall be terminated at the expiration of a certain period, shall be a sufficient termination of the lease and license from the time of posting or delivering such notice, or from the expiration of the period therein mentioned, as the case may be. Any termination of this lease and license shall not release the lessee from his obligation to pay rent or royalty for the period prior to such termination, and shall be without prejudice to any other rights or remedies which the lessor may have for violation of contract, use of machines without right or use of patented inventions without license.

Eight. The lessee admits the validity for the full term expressed in the grant thereof (and every extension and renewal thereof) of each and every of the Letters Patent of the United States of America, owned by the lessor or under which it is licensed, any of the inventions of which are or hereafter may be embodied in the leased machinery. The lessee also agrees that he will not directly or indirectly infringe or contest the validity for the full term expressed in the grant thereof, or of any extension or renewal thereof, of any of said Letters Patent or the title of the lessor thereto. The expiration or termination of the lease and license hereby granted shall not in any way affect the provisions of this clause, or release or discharge the lessee from the admissions and estoppels herein set forth.

Nine. None of the conditions, stipulations or provisions of this agreement shall be be held to have been waived by any act or knowledge of the lessor, its agents or employees, but only by an instrument in writing, signed by the president, a vice-president or the treasurer of the lessor.

Ten. The term "lessor" shall include the said O. A. Miller Treeing Machine Company and its successors and assigns. All the conditions, stipulations and provisions binding on the lessee shall

be binding on and enforceable against his legal representatives. In the construction of this instrument, words relating to the number and gender of the parties shall be read according to their real number and gender.

In witness whereof, the parties hereto have duly executed this instrument in duplicate, the day and year first above written.

PLAINTIFF'S EXHIBIT 56.

[Put in Evidence, page 405.]

Lease and License Agreement Number . (1808)

This Agreement made at Boston, in the State of Massachusetts, this day of 19 , between the United Shoe Machinery Company, a corporation organized under the laws of the State of New Jersey, having an office in said Boston, hereinafter referred to as the lessor, of the one part, and of in the State of , hereinafter referred to as the lessee, of the other part:

Witnesseth, that the lessor, in consideration of the covenants and agreements on the part of the lessee herein contained, does hereby lease to and license the lessee under any letters patent belonging to the lessor or under which the lessor has the right to grant such license affecting any inventions which are now or hereafter shall be embodied therein or employed in the operation thereof, to use

Patent Leather Repairing Machine(s), No(s).

and any finishing belts, duplicate parts, extras, mechanisms and

devices relating thereto, or used in connection therewith, now attached to or delivered with the said designated machine or machines or which may at any time hereafter be obtained from the lessor, or be added thereto by or with the consent of the lessor (the whole of which machine or machines, finishing belts, duplicate parts, extras, mechanisms and devices, held by the lessee under these presents, whether now or hereafter delivered to or in the possession of the lessee, is hereinafter referred to as the "leased machinery"), subject to the conditions hereinafter contained.

And that the following are agreed to as conditions of this agreement, all of which the lessee covenants and agrees to keep and perform: —

One. The leased machinery shall at all times remain and be the sole and exclusive property of the lessor, and the lessee shall have no right of property therein, but only the right to use the same, upon the conditions herein contained. The leased machinery shall be used only by the lessee himself, or by operatives in his direct employ, and only in the factory now occupied by him at in the State of . The leased machinery shall not be transferred or delivered or sublet to any other person or corporation, and neither this agreement nor the lease nor the license hereby granted can be assigned by the lessee by his own act or by operation of law. If the lessee becomes insolvent or bankrupt, or has a receiving order made against him, or makes or executes any bill of sale, deed of trust or assignment for the benefit of his creditors, or if a sale, mortgage, lease or removal of the leased machinery, or any part thereof, be made or attempted, or if any distress or execution or attachment be levied thereon, then and in each such case any or all leases of or licenses to use machinery then existing between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, shall at the option of the lessor cease and determine, and the possession of and full right to and control of all machinery the leases or licenses of which are so terminated, shall thereupon revest in the lessor free from all claims and demands whatsoever. The lessor and its agents and employees

shall at all times be given access to the leased machinery for the purpose of inspecting it or watching its use and operation, or of altering, repairing, improving, or adding to it, or determining the nature or extent of its use, and the lessee shall afford all reasonable facilities therefor.

Two. The lessee shall at all times and at his own expense keep the leased machinery in good and efficient working order and condition, and shall not permit any one to injure or deface or remove any plate, or dates, numbers, or other inscriptions now or hereafter impressed on or affixed to the leased machinery by the lessor. The lessee shall obtain from the lessor exclusively, and shall pay therefor at the regular prices from time to time established by the lessor, all the finishing belts, duplicate parts, extras, mechanisms and devices, of every kind needed or used in operating, repairing, or renewing the leased machinery, and the same shall form part of the leased machinery, and the lessee shall not otherwise make or allow to be made any addition, subtraction or alteration to, from, or in the leased machinery without the consent in writing of the lessor nor interfere with the proper operation of the same.

Three. The leased machinery shall at all times, until the expiration or termination of the lease thereof and license to use the same hereby granted and the re-delivery of the leased machinery into the possession of the lessor as hereinafter provided, be held at the sole risk of the lessee from injury, loss or destruction, and in case any machine or machines hereby leased shall be destroyed by fire or otherwise before such expiration or termination and re-delivery, the lessee shall pay to the lessor upon demand the sum of One Hundred Dollars ($100) in respect to each machine so destroyed as partial reimbursement to the lessor for such destruction, and the lessee shall forthwith return whatever remains of all the machinery so destroyed to the lessor at Beverly, Massachusetts.

Four. The lessee shall pay all taxes and assessments which shall be assessed in respect to the leased machinery or other machinery of the lessor held by the lessee under lease or license upon whomsoever assessed. All taxes or assessments in respect to leases, licenses or agreements covering machinery, or the rights to pay-

ments thereunder, shall be construed, for the purposes of this article, to be assessed in respect to the machinery itself. In case at any time any unapportioned tax or assessment shall be assessed to the lessor in respect in part but not wholly to machinery of the lessor in the possession of the lessee the lessee shall pay to the lessor such proportionate part of the total amount of said unapportioned tax or assessment as the fair valuation, to be determined by the lessor, of said machinery of the lessor in the possession of the lessee bears to the fair valuation, to be determined by the lessor, of all machinery (excepting machinery, if any, in the lessor's own possession) in respect to which the unapportioned tax or assessment has been assessed; provided, however, that if such unapportioned tax or assessment includes any tax or assessment in respect to tangible property in the lessor's own possession the amount thereof, based, at the established rate, upon the fair valuation, to be determined by the lessor, of such property, shall first be deducted and the lessee shall pay his proportionate part as aforesaid of the balance only of said unapportioned tax or assessment after such deduction has been made.

Five. The leased machinery shall be used only in the manufacture of welted footwear which has been or shall be welted and the soles stitched by welt sewing and sole stitching machinery held by the lessee under lease from the lessor, or in the manufacture of turned footwear, the soles of which have been or shall be attached to their uppers by turn sewing machinery held by the lessee under lease from the lessor, or in the manufacture of other kinds of footwea. which have been or shall be lasted by lasting machines held by the lessee under lease from the lessor.

Six. The lessee shall pay to the lessor immediately after the execution hereof as a lease premium the sum of One Hundred Dollars ($100) for each machine hereby leased. The lessee shall also pay to the lessor as rental or royalty for the leased machinery the fixed sum of Four Dollars ($4) per month for each machine hereby leased, payable on the fifteenth day of each calendar month in respect to the preceding calendar month.

Seven. The lessor may attach to the leased machinery, or any

thereof, an indicator or indicators to register the number of revolutions or movements of any part or parts thereof, and the lessee shall not allow any person (other than the lessor or its agents) to disturb or interfere with such indicator or indicators. In case any indicator thus attached shall from any cause cease to correctly indicate or register, or shall be disturbed or out of repair, or if the glass covering any such indicator shall be removed or broken or injured, then and as often as the same shall happen the lessee shall immediately by writing notify the lessor and at the same time explain the circumstances under which the same has happened. The lessee shall, if so requested by the lessor any time, keep full and accurate accounts independently of any indicators that may be placed upon the leased machinery showing the number of boots, shoes and other footwear, or portions thereof, in the manufacture or preparation of which the leased machinery or any part thereof shall be used, and shall, upon request, allow the lessor at any and all times, by its agents or attorneys, to examine and take copies of all such accounts and entries of the lessee as may aid in determining the number of boots, shoes and other footwear, or portions thereof, operated upon by the leased machinery or any part thereof; and the lessee shall produce all such accounts and entries upon request. The lessee shall, if so requested by the lessor at any time, render to the lessor such statements and furnish to the lessor such other information as may be called for with reference to the leased machinery or the use thereof.

And that the following stipulations and provisions are agreed to:—

Eight. The term of this agreement shall be seventeen years from the date hereof. The lease of the leased machinery and license to use the same hereby granted shall continue, unless sooner terminated by the lessor because of breach thereof on the part of the lessee or otherwise as herein provided, for the full term of this agreement. But if any breach or default shall be made in the observance of any one or more of the conditions in this agreement contained or contained in any other lease or license agreement subsisting between the lessor and the lessee, whether as the result of

assignment to the lessor or otherwise, and expressed to be obligatory upon the lessee, the lessor shall have the right, by notice in writing to the lessee, to terminate forthwith any or all leases of or licenses to use machinery then existing between the lessor and the lessee, and this notwithstanding that previous breaches or defaults may have been unnoticed, waived, or condoned by or on behalf of the lessor. If, upon the expiration of the full term of this agreement, the lessor does not request the return of the leased machinery, then the leased machinery shall continue to be held and used under and in accordance with the conditions, stipulations and provisions in this agreement contained, and this agreement and the lease and license herein contained shall thereupon be extended indefinitely as to term; but thereafter either the lessee or the lessor, upon sixty days' notice in writing to the other, may terminate this agreement and the lease and license herein contained, whereupon the leased machinery shall be delivered forthwith to the lessor, as herein provided. Upon the expiration or termination of this agreement or any extension thereof or of the lease and license herein contained by notice or by reason of any default on the part of the lessee as to the terms of this agreement or any other lease or license agreement from the lessor, or otherwise in any manner whatsoever, the lessee shall forthwith, at his own expense, deliver the leased machinery to the lessor at Beverly, Massachusetts, complete and in good order, reasonable wear and tear alone excepted and shall thereafter upon demand pay to the lessor such sum as may be necessary to cover replacement of all missing or broken parts at the regular prices established by the lessor therefor; and the lessee, for himself, his heirs, executors and administrators, hereby grants to the lessor, its successors and assigns, full right, power, and authority to enter upon the premises and into any factory, room, or any place where the leased machinery or any part thereof may be, and take possession thereof and take away the same; and the lessee shall have no claim for the repayment of any sum or sums or any part thereof which he shall have paid as consideration for the grant of this lease and license or for rent or royalty or otherwise in respect to the leased machinery.

Nine. In case at any time the leased machinery, or any thereof, shall have parts missing or broken or shall not otherwise, in the opinion of the lessor, be in good and efficient working order and condition, the lessor, without prejudice to any other of its rights or remedies, may forthwith put the same in good and efficient working order and condition, and may replace all broken or missing parts, and the lessee shall forthwith pay the lessor the expense of making such repairs and for all parts supplied at the regular prices established by the lessor for such parts.

Ten. A notice in writing, signed by the president, a vice-president, the treasurer or an assistant treasurer of the lessor, or by any assignee of the lessor's rights hereunder and posted by prepaid letter, addressed to the lessee or delivered at his usual or last known place of abode or business, that the lease and license hereby granted is terminated or shall be terminated at the expiration of a certain period, shall be a sufficient termination of the lease and license from the time of posting or delivering such notice, or from the expiration of the period therein mentioned, as the case may be. Any termination of this agreement or of the lease and license hereby granted shall not release the lessee from his obligation to pay rent or royalty for the period prior to such termination and shall be without prejudice to any other rights or remedies which the lessor may have for violation of contract, use of machines without right or use of patented inventions without license.

Eleven. The lessee admits the validity for the full term expressed in the grant thereof (and every extension and renewal thereof) of each and every of the Letters Patent of the United States of America, owned by the lessor or under which it is licensed, any of the inventions of which are or hereafter may be embodied in the leased machinery. The lessee also agrees that he will not directly or indirectly infringe or contest the validity for the full term expressed in the grant thereof, or of any extension or renewal thereof, of any of said Letters Patent or the title of the lessor thereto. The expiration of this agreement or any extension thereof or the termination or cesser of the lease and license hereby granted shall not in any way affect the provisions of this clause, or release

or discharge the lessee from the admissions and estoppels herein set forth.

Twelve. None of the conditions, stipulations or provisions of this agreement shall be held to have been waived by any act or knowledge of the lessor, its agents or employees, but only by an instrument in writing, signed by the president, a vice-president or the treasurer of the lessor.

Thirteen. The term "lessor" shall include the said United Shoe Machinery Company and its successors and assigns. All the conditions, stipulations and provisions binding on the lessee shall be binding on and enforceable against his legal representatives. In the construction of this instrument, words relating to the number and gender of the parties shall be read according to their real number and gender.

In witness whereof, the parties hereto have duly executed this instrument in duplicate, the day and year first above written.

General Department. (1806)

Lease and License Agreement Number .

This Agreement made at Boston, in the State of Massachusetts, this day of , 19 , between the United Shoe Machinery Company, a corporation organized under the laws of the State of New Jersey, having an office in said Boston, hereinafter referred to as the lessor, of the one part, and of in the State of , hereinafter referred to as the lessee, of the other part:

Witnesseth, that the lessor in consideration of the covenants and agreements on the part of the lessee herein contained, does hereby lease to and license the lessee under any letters patent belonging to the lessor or under which the lessor has the right to grant such license affecting any inventions which are now or hereafter shall be embodied therein or employed in the operation thereof, to use the machine or machines of the General Department of the lessor now or hereafter delivered to the lessee and designated by number or numbers in the following schedule, viz. : —

SCHEDULE OF MACHINES.

Miller Twin Shoe Treeing Machine, No.
Right Tree Leg, No.
Left Tree Leg, No.

and any tree legs, tree feet, tree backs, irons, duplicates, parts, extras, mechanisms and devices relating thereto, or used in connection therewith, now attached to or delivered with the said designated machine or machines, or which may at any time hereafter be obtained from the lessor, or be added thereto by or with the consent of the lessor (the whole of which machine or machines, tree legs, tree feet, tree backs, irons, duplicates, parts, extras, mechanisms and devices, held by the lessee under these presents, whether now or hereafter delivered to or in the possession of the lessee, is hereinafter referred to as the "leased machinery"), subject to the conditions hereinafter contained.

And that the following are agreed to as conditions of this agreement, all of which the lessee covenants and agrees to keep and perform : —
